THE ENCYCLOPEDIA AMERICANA

Doylestown, Pa., borough, county-seat of Bucks County, 28 miles north of Philadelphia, the terminus of a branch of the Philadelphia and Reading Railway. It is in a fertile farming section and has a thriving local trade. It has a court-house, public library, an academy, a female seminary, graded schools, and handsome churches and private residences. The town is lighted by gas and electricity. Its chief manufactures are of wagons, carriages and farm implements, flour, lumber, soap, woolens, and cabinet ware; a foundry, creamery, tannery, and clay-works. Doylestown has a national bank, a trust company, and daily and weekly papers. It is a popular residence town and has a large summer population. Pop. (1890) 2,519; (1900) 3,034.

Dozier, Orion T., American physician and author: b. Marion Co., Ga., 18 Aug. 1848. He was graduated at the Atlanta Medical College in 1874, and practised his profession in Alabama, Missouri, and Georgia, finally settling in Birmingham, Ala., in 1890. He was the originator and organizer of the order The Regents of the White Shield, 1892; has made several useful inventions; and wrote 'Foibles of Fancy and Rhymes of the Times' (1894); and 'Poems Patriotic' (1898).

Do'zsa, dō'zho, George, Hungarian revolutionist, leader in the Peasant War of 1514. Dozsa recruited an army, ostensibly for a crusade against the Turks, and when his force had reached something more than 50,000 men began with it to devastate the country. He was captured at Temesvár, put to death by torture, and his army dispersed. This rebellion is the theme of 'Hungary in 1514,' a novel by Joseph Eötvös (q.v.).

Dozy, Reinhart Pieter Anne, Dutch Orientalist and historian, of French Huguenot descent: b. Leyden 21 Feb. 1820; d. there 29 April 1883. He obtained the degree of doctor from the University of Leyden in 1844. The following six years were spent in study and writing, and in preparing a catalogue of the Oriental manuscripts in the university library. He was made an extraordinary professor of his-

tory in 1850, and full professor in 1857. He was considered one of the most learned and critical scholars of Arabic of his time; was an authority upon Oriental language and history, and spoke and wrote almost all of the European languages with facility. He is known chiefly by his great work 'Histoire des Mussulmans d'Espagne, jusqu'à la Conquête de l'Andalousie par les Almoravides, 711-1110' (1861, 2d ed. 1881), and its supplementary volume 'Recherches sur l'Histoire et la Littérature de l'Espagne pendant le Moyen Age' (1849, 2d ed. 1860, 3d ed. 1881), which remain the standard works upon this period of Spanish history, and by his 'Supplément aux Dictionnaires Arabes' (1877-81). Other important works are his 'Dictionnaire détaillé de noms des vêtements chez les Arabes' (1845); 'Scriptorum Arabum loci de Abbaditis' (1846); 'Commentaire historique sur le poème d'Ibn Abdoun par Ibn Badroun' (1846); 'History of the Almohades' (1847); 'Histoire de l'Afrique et de l'Espagne' (1848); 'Al Makkari, Analectes sur l'Histoire et la Littérature des Arabes d'Espagne' (1855-61); 'Het Islamisme' (1863); and 'De Israëlieten te Mekka' (1864).

Draa, drä, or Wady Draa, a river of Morocco, rising in the Atlas Mountains and flowing southwards till it penetrates the Anti-Atlas at Shagerun. Beyond this point it flows sluggishly through the desert, at first south and then west, forming the shallow lagoon El Debaia. After this it is a wady constituting the southern limit of Morocco.

Dracæna, dra se'na, a genus of tropical plants of the natural order *Liliacæ*. The species are characterized by woody stems, which bear numerous sword-shaped leaves crowded together near the summit, and greenish-white, or yellowish flowers, in panicles or heads. A few of the species are cultivated in hothouses, for their attractive colored foliage. The most notable species is, probably *D. draco*, the dragon-tree of the Canary Islands, which attains a height of from 30 to 50 feet, though in one notable specimen, at Teneriffe, the height was 70 feet, and the diameter 15 feet. This was when Humboldt visited the island. When this tree was

DRACHENFELS—DRAFT RIOTS

destroyed by a storm in 1868 it was estimated to be about 6,000 years old. It was not only an object of worship, but its sanctuary was inside its own trunk.

Drachenfels, dră'hĕn fĕlz, "the castled crag of Drachenfels," as Byron calls it, one of the hills known as the Siebengebirge, in the government of Cologne, in Rhenish Prussia, about eight miles southeast of Bonn. It is the most remarkable of the group, which are all evidently volcanic; rises about 900 feet above the Rhine, and is crowned by the old castle of Drachenfels, commanding a magnificent view. It takes its name (Dragon Rock) from the legend of a dragon which occupied a cavern in it, and was slain by Siegfried, the hero of the Nibelungenlied.

Drachma, drăk'mă, the unit of weight and of money among the ancient Greeks, both as a weight and a coin contained six oboli, and was itself the one hundredth part of a mina, and the six thousandth part of a talent. The weight of the Attic drachma was 67.5 grains English troy weight, and the Attic talent 70.3 pounds. There were several other kinds of drachma and talent in use: those of Ægina were the heaviest. Whenever no particular kind is designated, the Attic talent is meant. The drachma was the principal Greek coin. It was of silver, and was divided, like the weight, into six oboli (silver). The tetradrachma (of four drachmas) was called the *stater*, but other coins also bore this name. These coins differed much in value in the different states of Greece and at different periods. The Attic drachma and stater occur most frequently. The value of the former may be stated as 17 cents, of the latter at about 80 cents. The drachma was regarded as equivalent to the Roman denarius. Besides these silver coins there were also the stater (or didrachm) of gold, equal in value to about \$5.63. In the time of Solon a sheep could be bought for one drachma, an ox for five. In the time of Demosthenes a fat ox cost 80 drachmas, a lamb 10. The drachma has an important position in the coinage and currency of modern Greece, being the standard unit of reckoning, and a silver coin equivalent to the French franc.

Drach'man, Bernard, American rabbi: b. New York 27 June 1861. He was educated at Columbia University and the University of Breslau and has been professor of biblical exegesis and Hebrew philosophy in the Jewish Theological Seminary of New York from 1887, and rabbi of the congregation Zichon Ephraim in that city from 1889. He is a staunch supporter of orthodox Judaism and is the author of 'The Place and Importance of Jehuda Hajjug in the History of Hebrew Grammar' (1885).

Drachmann, Holger Henrik Herholdt, hŏl'gĕr hĕn'rik hĕr'hŏlt drăh'măn, Danish poet, painter, and novelist: b. Copenhagen 9 Oct. 1846. He is essentially an improvisatore; and his works show a lively fancy and excel in descriptions of the life of the common people, especially fishermen and mariners. His 'Poems' appeared in 1872. His novels include 'Condemned' (1890); 'Once Upon a Time'; 'Paul and Virginia' (1879); and 'Sea Tales.' His best known painting is 'From Hamburg Harbor,' presented by the Danes in Hamburg to the king and queen of Denmark a few years ago. Drachmann visited the United States in 1898.

Draco, dră'kŏ, Athenian legislator: fl. about 621 B.C. His name has become proverbial for severity, and his laws were hence said to have been written in blood, not ink. It seems, however, probable that Draco only put in writing the laws of his time and nation, which punished petty theft, and even idleness, no less severely than the robber of the temples and the murderer. Subsequently years afterwards, Solon was commissioned to draw up a new code. Tradition relates that Draco, on his appearance in the theatre at Ægina, was suffocated by an enthusiastic audience, who, according to their custom, threw their garments and caps upon him.

Draco, an ancient northern constellation. The Gamma Draconis, a bright star nearly in the solstitial colure, was used in determining the coefficient of aberration of the fixed stars.

Dracoceph'alum, a genus of odoriferous annual or perennial herbs, of the mint family (*Labiatae*), numbering about 35 species, natives of the northern hemisphere. The name is Greek for Dragonhead, which is a reference to the resemblance of the flowers to the head of the dragons of myth. Of the species comprised in the genus, but two are American. American Dragonhead (*D. parviflorum*) is an annual, two to six feet high with light blue flowers, common in stony soil from Ontario, through northern New York, to Minnesota and Alaska, and in the Rocky Mountain region to Mexico. The other species is found only in a restricted area in Nebraska and northern Mexico. It was introduced from Europe and is listed as Moldavian dragonhead. The most generally cultivated species is (*D. canariense*), or Canary Balm of Gilead.

Dracon'tium, a genus of tropical American araceous plants. They comprise six species distinguished by a fetid flower, tall peduncle, trifid leaves, and tuberous root. *D. polyphyllum* has been recommended as an antidote for snake bites. The skunk cabbage, *Symplocarpus foetidus*, pharmaceutically known as *Dracontium fatidum*, was formerly assigned to this genus. See SKUNK CABBAGE.

Draft, a written order for the payment of a sum of money addressed to some person who holds money in trust, or who acts in the capacity of agent or servant of the drawer. Documents of this kind often pass between one department of a bank or mercantile house and some other department, and are distinguished from bills of exchange and checks, in not being drawn upon a debtor. One reason for using them is the convenience in keeping accounts and having vouchers for payments.

Draft Riots, in New York, July 1863, were serious disturbances caused by the military conscription or drafts (q.v.) of that year, which met with a storm of denunciation from Democratic leaders and followers alike. The former proclaimed it unconstitutional, because military service was due only to the States; dangerous, as liable to absorb all the State militia and civil officials into the Federal service; and partisan in execution, the quotas having been gerrymandered to throw an enormous disproportion on the Democratic districts. This last was true, but was the work of subordinates, and was corrected by the War Department on protest. The

rank and file execrated it as a class measure, shifting the burden from the rich, to whom \$300 was a trifle, to the poor, who could pay only with their blood, and were least able to leave their families. The only answers were the nation's need, the law of nature that all burdens fall thus on the poor, and the government's wages, bounties, and pensions which strained it to relieve distress. But the legal and party arguments reinforced the class hatred and anti-war prejudice, and Gov. Horatio Seymour, the head of the Democratic party, sent his adjutant-general to Washington about 10 July to urge the postponement of the draft, on the ground of this popular excitement.

The drafting began, however, on Saturday morning, 11 July, at each provost-marshal's or assistant's office: which in the Ninth District, a Democratic stronghold, was at Third Avenue and 46th Street. The method was to place the enrolled names in a wheel and turn it, the first names coming out up to the assigned quota being the conscripts. A large crowd assembled, but made no disturbance; and the names drawn were published in the Sunday papers. Many of the poorer ones, incited and organized by political leaders, met secretly and formed associations to resist; and on Monday morning, parties went around the shops compelling workmen to leave their tasks and join the procession. The drawing was resumed at 10 A.M.; in a few minutes several paving-stones, one after another, were hurled through the windows into the midst of the crowd, smashing the furniture; and in another moment the mob broke in the door, wrecked everything inside but the wheel, beat one of the deputies into insensibility, and set fire to the building, though it was inhabited above. The whole block was shortly in flames; and when the firemen arrived, the hydrants were denied them till the conflagration was past help. The militia were nearly all in Pennsylvania, where Gettysburg had lately been fought, and the few garrison regulars and marines were under different commands; so that the Federal Gen. Wool, the State Gen. Sanford, and Mayor Opdyke, held separate authority with no deciding power. The mob increased, and began wreaking vengeance on political opponents and their property, burning and pillaging; and thieves and toughs, seeing their opportunity, flocked out and joined. Fifty marines, sent to disperse the 46th Street mob, fired blank cartridges, and were instantly routed and chased far along the streets by the rioters, many of them women and children. This changed the mob's attitude from defense to aggression; a squad of police was set upon and one killed. Then their wrath was turned on the negroes, as the cause of the "Black Republican War." These were beaten and stoned to death, and hanged to lamp-posts; hotels and restaurants having colored servants were invaded in search of them, and the movables smashed or stolen. In the afternoon the Colored Half-Orphan Asylum, with 700 to 800 children and nurses, was broken into, gutted and set on fire, the inmates being driven into the street while the women of the mob carried off the furniture. The armory on Second Avenue was broken open with stones and sledge-hammers to secure the arms, the police who bravely defended it driven out, and it was fired. All business and trade were suspended. In the lower

part of the city the office of the *Tribune*, the chief Republican paper, edited by the abolitionist, Horace Greeley, was attacked and about to be set on fire, but the police drove out the rioters. The entire block on Broadway which held the draft office was burned, with the provost-marshal's and the postmaster's private residences, a station-house, a hotel whose proprietor refused liquor to the mob, and other dwellings; and other houses were burned in the upper part. All that day and night the city was protected only by the police, many of whom lost their lives. At midnight a heavy rain dispersed the rioters for the time.

Tuesday was far worse, though the forces of order had begun to gather. The mobs too had swollen so that an army was needed: when bands were dispersed by the military, they gathered elsewhere and continued murder and depredation. Twenty negroes probably had been murdered Monday; far more perished Tuesday, and whole negro neighborhoods were burned out. Lieut. Wood with 150 regulars from Fort Lafayette fired a ball cartridge into a mob, killed a dozen and broke it up, but no officer could be ubiquitous. Col. O'Brien, who had dispersed a mob, sprained his ankle and stepped into a drug store; ordered out by the terrified proprietor, the mob murdered him and dragged his carcass up and down the street, mutilating and trampling on it. Gov. Seymour issued a proclamation summoning the rioters to disperse, but it was so insufficient that he was forced to issue another putting the city under martial law. Meantime the secretary of war had ordered home the militia regiments in Pennsylvania, and they began to arrive on Wednesday; the draft was announced as temporarily suspended; and the mob was so thoroughly beaten and cowed on Wednesday afternoon that cavalry regiments paraded the city at night without meeting any resistance. Isolated gangs prowled about even on Thursday, but they were mere criminals and soon slunk away. The property-holders had formed associations for self-protection, and the danger was mainly at an end by Thursday morning. The losses of these four days were never known. The bills of mortality for the week were 450 above the average; 90 deaths from gunshot wounds were reported; and it was said that many rioters were secretly buried by their friends. Claims for property damage were filed to over \$2,500,000; though heavily scaled, something like \$1,500,000 were paid. The draft was resumed on 19 Aug., and ended on the 28th. Consult: 'Official Records,' XXVII. Pt. 2, 1889; Fry's 'New York and the Conscription of 1863,' 1885; Greeley's 'American Conflict,' Vol. II., 1866.

Drafts, or Military Conscriptions, in the history of the United States, aside from the drafts of the Confederate States of 18 July 1863, and the sweeping one of 17 Feb. 1864, which was in action all through the latter part of the Civil War — are known by those of 1814 and 1863. The former, however, was such only in purpose, as it never went into action or became law. In the Revolution, the regular armies of the United States were recruited by drafts from the State militia (see *CONTINENTAL ARMY*), but these transfers were made by requisitions on the States, who furnished and officered their quotas in such bodies as they chose. The Constitution gave Congress the twofold power to

"raise armies," and to "organize and arm the militia." Knox in 1790, and Jefferson in several annual messages urged a thorough plan for the latter, classifying the militia independently of the State organizations, and drafting one from each section as needed; but jealousy of the States' rights over the militia was too strong. In the War of 1812, requisition was made on States for militia to replace coast garrisons, denuded for invasion of Canada, but Connecticut and Massachusetts refused on the ground that as this country was not invaded, there was no constitutional right to summon the militia. When this excuse failed, others were found; in 1813 a militia organization bill passed the House, but failed in the Senate. In 1814 the increasing exigencies forced a bill through Congress (Senate 10 Nov.; House 9 Dec.), on suggestion of the New York and Virginia legislatures; but even its Democratic supporters doubted its being either constitutional or useful, and the House loaded it with an amendment on which the Senate disagreed, as doubtless intended. The war ended shortly after.—In the Civil War, volunteering filled the armies during the first two years, the quotas being apportioned by congressional districts; then the numbers grew scant, and on 3 March 1863 the "Conscription Bill" passed. The intent was the old plan of militia classification and draft, but the Democrats held it unconstitutional, and their arguments were unanswerable. The Republicans therefore fell back on the broad power to "raise armies," as implying the right to fix the method of so doing; this in turn was incontrovertible, and upheld by the Supreme Court. The State militias were ignored. All able-bodied citizens between 18 and 45 were summoned to the national defense, and were to be enrolled from 1 April on by the provost-marshal; quotas under future calls not filled by volunteers after a certain period were to be made good by lot from the enrollment; conscripts could furnish substitutes or buy exemption for \$300; all persons refusing obedience to be punishable as deserters. Early in May 300,000 more troops were called for; many Eastern cities were already in arrears, and the poorer classes, especially those politically hostile to the War, grew very bitter at the real hardships and the real and alleged unfairness of the conscription. The invasion of Pennsylvania by Lee had drawn the Northern State militia thither in June and early July, and the mob in several places undertook to resist the draft. The police easily put down the rising except in New York, where the great numbers of the rioters, reinforced by the criminal classes, gave the city into their hands for two days, 13 and 14 July, and they were not suppressed till the 15th. (See DRAFT RIOTS.) The drafts interrupted by these disorders were resumed and carried through. But their chief value was in goading the districts into filling the quotas by volunteers; however legal, they were incredibly scanty of direct results. The commutations were toward a third of the whole, the exemptions nearly a half, and the number held and their substitutes together were but a sixth to a fifth. Also, many of the substitutes turned deserters or "bounty-jumpers." It has been estimated that of over 3,000,000 enrolled, less than 100,000 men were obtained by the drafts.

Drage, Geoffrey, English publicist: b. 1860. He was educated at Eton and Oxford and is a barrister of Lincoln's Inn and the Middle Temple, but has never practised. He was secretary of the Royal Commission on Labor, (1891-94), and M.P. for Derby (1895-1900). He has published 'Criminal Code of German Empire with Prolegomena and Commentary' (1885); 'Cyril,' a novel (1889, 8th ed. 1899); 'Eton and the Empire' (1890); 'Foreign Reports of Royal Commission on Labor'; 'Eton and the Labor Question' (1894); 'The Unemployed' (1894); 'The Problem of the Aged Poor' (1895); 'The Labor Problem' (1896).

Drag'oman, the general name given in Levant countries to an interpreter, or to a guide to foreigners. The dragoman is, however, much more than the Italian *cicerone*, or the French *commissionnaire* or *valet de place*. In Syria, for example, he is a contractor for the management of expeditions, and undertakes to solve all the difficulties that arise between the traveler and the natives. The dragomans attached to embassies have special privileges. Student dragomans is a term sometimes given to student interpreters preparing for the British consular service in the Orient. The dragoman to the porte, through whom diplomatic negotiations with foreign powers were formerly carried on, used to be a very important dignity.

Dragon, a genus of arboreal lizards, of which the most familiar is *Draco volans*. The genus is especially remarkable for the extension of the skin of the sides on the prolonged posterior ribs. A parachute is thus formed which enables the dragon to take rapid swoops from branch to branch. The tail is very long; the skin of the throat forms a loose wattle; the colors are particularly brilliant. There are several species inhabitants of the East Indies, not including Ceylon. The term dragon has also been applied in modern times to a large lizard (*Thorictis dracana*) found in Brazil and Guiana. It attains a length of three feet, most of which goes to the tail. *Tejus* and *Ameiva* are allied genera. See LIZARDS; REPTILES.

Dragon, a fabulous monster found in the mythology of nearly all nations, from Greece to China, where it forms the national ensign. It is usually depicted as a huge serpent of abnormal form. Ancient legends represent the dragon as a snake, watching as sentinel the Garden of the Hesperides, or guarding the tree on which was hung the Golden Fleece at Colchis. In other places it appears as a monster, making the neighborhood around its cave unsafe, and desolating the land; its death being ascribed to a hero or god, providentially appointed for the task, which was a service to all mankind. The dragons which appear in early paintings and sculptures are invariably representations of a winged crocodile.

In Christian art the dragon is the emblem of the Devil. As the form under which Satan, the personification of sin, is depicted, the dragon is met with in pictures of St. Michael, and St. Margaret, when it typifies sin conquered; it also appears under the feet of the Saviour, and under those of the Virgin, in both cases with the same idea. The dragon also typifies idolatry. In pictures of St. George and St. Sylvester, it suggests the conquest of paganism by Christianity. In pictures of St. Martha, it symbolizes the inun-

DRAGON — DRAGON-FLY

dation of the Rhone, spreading pestilence and death, and arrested in its course of devastation by the miraculous interposition of Mary's sister. St. John the Evangelist is sometimes represented holding a chalice, from whence issues a winged dragon, in which case it symbolizes the poison which was miraculously eliminated from the chalice wine, into which hemlock had been put. The dragon appears on the shield of the most famous of Christian heroes, as well as on the helmets of kings and generals. It is found on English shields after the time of William the Conqueror. In modern heraldry, it appears on the shield and helmet; as supporter, it is called a lindworm when it has no wings, and serpent when it has no feet; when it hangs by the head and wings it means a conquered dragon.

Dragon, in astronomy, one of the ancient northern constellations, in Latin, *Draco*. The figure is that of a serpent with several small coils. It appears at a very ancient date to have had wings in the space now occupied by the Little Bear. Fable says that Juno translated to the heavens the dragon which kept the golden apples in the Garden of the Hesperides, and which was slain by Hercules. See *HESPERIDES*.

Dragon-fly, an order of insects, the *Odonata*, allied to the may-flies and *Ephemeroidea*, with long, slender bodies, very large mobile heads, immense eyes, short antennæ, and two pairs of long, nearly equal wings of a firm and glossy texture, and closely netted with many veins. The mandibles are powerful, the mouth-parts being so fused and solidified as to form a most effective trap for catching the small insects upon which dragon-flies feed. The pro-thorax is small, the meta-thorax and meso-thorax large, and the meso-thorax slopes over the meta-thorax, by which arrangement the spinous legs are thrust forward, so that they project under the head. These legs are unfitted, and are never used, for walking, but as instruments for catching and holding prey or for clinging to plants. The hind body is proportionately longer than in any other group of insects; it has 10 evident segments, the hindmost carrying a pair of stiff unjointed cercopods. The male genital armor is situated on the second abdominal segment — a position unknown in any other insect; and the intromittent organs are separate from the ejaculatory ducts, the latter being near the extremity of the abdomen. "Therefore," as Howard explains, "before copulation the male curves his abdomen around beneath, so that the ninth segment of the abdomen is brought into contact with the second, thus transferring the fertilizing fluid to the intromittent organ. The tip of the abdomen of the female is bent around and joins with the underside of the second segment of the male's abdomen, the male frequently grasping the female around the neck with certain appendages at the extremity of his abdomen. This complicated embrace once obtained is likely to be held during the whole process of egg-laying, even in many cases when the deposition takes place under water.

Dragon-flies are semi-aquatic in all their life and habits. The eggs are laid in the stems of submerged plants by some species, which are provided with an instrument for cutting through the bark, each egg being pushed into the cutting as the female moves down the stem. As a rule, however, the eggs are dropped into the water, or

washed off by dipping the tip of the abdomen. The number of eggs laid is large, exceeding 100,000 in the case of many *libellulids*.

When the eggs hatch the young immediately begin a life of activity and depredation. Molts follow one another rapidly, and the first larval form soon changes into a "nymph," a form equivalent to the pupa stage of other insects, but differing in the fact that activity continues. These young remain under water, have short, broad hinder bodies, walking legs, feelers, and breathe by means of "rectal gills." They prey upon everything edible, including their own weaker brethren. To assist them in doing this the mouth-parts are modified into an insect-catching trap, forming an innocent-looking mask, within which are concealed grasping organs, ready to be shot out when an unsuspecting little animal creeps too near and the mask is suddenly lifted. When the broad and flattened nymph has become full-grown it crawls out of the water upon some warm rock, where presently its skin splits open and the adult dragon-fly emerges. These changes are easily studied by breeding dragon-flies in an aquarium.

The voracity of dragon-flies is notorious. They seize and devour all sorts of insects, including smaller species of their own race, and sometimes moths, butterflies and wasps. Flies form their principal fare, however, and they consume vast quantities of house-flies and mosquitoes, but their service in killing the latter pests is mainly done during the larval stages. They abound, in midsummer, in most parts of the world, and sometimes appear in enormous flocks, millions moving across the country in company; such swarms are the result of various local conditions, and are not migrations, properly speaking. The great beauty which most of the species have, glittering in metallic hues and skimming through the sunshine on brilliant, gauzy wings, has made them objects of universal admiration; but this admiration is strangely coupled with a popular fear and superstition toward them. Thus they are commonly known among American children as "devil's darning-needles," and are accused of an intention to sew up the ears of bad boys, or work mischief in the hair of naughty girls. The negroes of the Southern States call them "snake-doctors," and say they feed and nurse ailing serpents. In Great Britain, they are known as "horse-stingers," "flying-adders," or "penny-adders," and are believed to carry a poisonous sting in their tails. All these superstitions are calumnies upon a harmless and beneficial insect.

About 2,000 species of dragon-flies have been described, of which an eighth are peculiar to the United States. The order contains two well-marked groups: the *Libellulidæ*, or dragon-flies proper, and the *Agrionidæ*, or damselflies, distinguished broadly by the fact that in the former the front wings are dissimilar, and are held horizontally in repose; while in the latter the wings are alike and are held vertically when the insect rests. Another distinguishing feature is the fact that in the *Libellulidæ* the eyes are sessile, sometimes meeting on the top of the head, while in the *Agrionidæ* the eyes are constricted at the base and peduncled. An important subdivision of the *Libellulidæ*, regarded by some as a separate family, is the *Æschnidæ*, which is characterized by the fact that the eyes touch on the top of the head. To this group belong many of the largest and most gaudy dragon-flies.

DRAGON ROOT — DRAHMS

An excellent illustrated account of North American dragon-flies will be found in L. O. Howard's 'The Insect Book' (1901), which contains further references. For British species consult Lucas' 'Handbook of British Dragon-flies' (1899).

Dragon Root, or Green Dragon (*Arisæma dracontium*), a plant of the *Arum* family, abounding in wet woods and along streams, from Maine west to Minnesota; and southward to Florida and Texas. The spathe envelops the greenish spadix, the upper part of which tapers into a long, slender appendage, extending beyond the apex of the spathe, sometimes as much as six inches. The corm contains an acrid or pungent sap, which is supposed to possess curative properties, and is much used as a household medicine, in the region of its growth.

Dragon-tree. See *DRACÆNA*.

Dragonnades, dråg-ô-nâds', the name given to the persecutions directed against the Protestants chiefly in the south of France, during the reign of Louis XIV. They commenced in Poitou, and their nature may be understood from a letter from Louvois, the French minister, to Marillac, the governor of the province. It is dated 18 March 1681, and says, *inter alia*, that his majesty wishes that the greatest number of troopers and officers be billeted on the Protestants, and that when a just division makes them liable only to to they may be saddled with 20. Marillac, thus instructed, lost no time in giving full effect to the letter, and the Protestants were everywhere subjected to cruel extortion and gross indignity at the hands of a brutal soldiery. These dragonnades were practised with still greater atrocity in Béarn 1684, and in all the other provinces where the Protestants existed in any considerable numbers. Resistance was attempted in several instances; thousands of the most enlightened merchants and skilful workmen left the country; carrying their talents and industry into the service of its enemies; but the far greater number, seeing resistance hopeless, and overcome by terror, gave in a feigned adhesion. While the excesses of the dragonnades should be absolutely condemned, it should not be forgotten that the aggressive fanaticism displayed by the Protestant sects in numerous atrocities, to a large extent balance the scale against the cruelties perpetrated in the execution of this measure.

Drag'onet, the common name of certain fishes of the family *Gobiidae* (q.v.). The gemmeous dragonet (*Callionymus lura*), a beautiful fish with a large head and a smooth tapering body, is found in the British seas. See *Goby*.

Dragon's Blood, a resinous juice obtained by incision from several different plants found between the tropics;—from the trunk of the *Pterocarpus draco*, a tree of the natural order *Leguminosæ*, growing in the West Indies, which yields American dragon's blood; from the *Calamus draco*, a palm of the East Indies; from a *Dalbergia* in Guiana, and a *Croton* in South America; and from the *Dracæna draco* (order *Liliacæ*), which is most celebrated in connection with the Canary Islands. A historic tree of this last species, at Orotava, acquired enormous dimensions, and was visited and celebrated by almost every traveler, including Humboldt, but was destroyed by a storm in 1867. It was

supposed to have been about 5,000 or 6,000 years old.

Dragon's blood is obtained, in commerce, in three principal forms—in that of oval masses of the size of a pigeon's egg, enveloped with leaves of the pandanus; in cylinders covered with palm leaves; and in irregular masses, marked with impressions of leaves; that in oval masses is the most esteemed.

Dragon's blood is opaque, of a deep reddish-brown color; brittle, and has a smooth and shining conchoidal fracture; when in thin laminae it is sometimes transparent; when burned it gives out an odor somewhat analogous to benzoin; its taste is a little astringent; it is soluble in alcohol, and the solution will permanently stain heated marble, for which purpose it is often used, as well as for staining leather and wood. It is also soluble in oil, and enters into the composition of a very brilliant varnish, which is much esteemed by artists. Its quality may be proved by making marks on paper; the best leaves a fine red trace, and commands a very high price. It was formerly in high repute as a medicine, but at the present time is very little used. An astringent resin, obtained from the *Eucalyptus resinifera* of Australia, sometimes gets the name of "dragon's blood" in that country.

Dragon's Mouths, a strait on the coast of Venezuela, running between the Island of Trinidad and the Paria Peninsula, and leading into the Gulf of Paria.

Dragoon, a mounted soldier, first introduced into the French army about 1585, and trained originally to fight chiefly on horseback, but, if necessary, on foot also, and mounted, armed, and exercised accordingly. Experience proving that they did not answer the end designed, they were hardly ever used in infantry service latterly, and now form a useful kind of cavalry. The term dragoon probably comes from *dragon*, a short species of carbine carried in 1554, on the muzzle of which, from the old fable that the dragon spouts fire, the head of the monster was worked. The first dragoon regiment raised in Great Britain was the Scots Greys (1681). There are at present in the British army three regiments of dragoons, and seven of dragoon guards, all being mounted and accoutred more after the fashion of heavy (or medium) cavalry than the hussar regiments. The three dragoon regiments are the 1st (Royal) Dragoons, the 2d Dragoons (Royal Scots Greys), and the 6th (Inniskilling) Dragoons. Both dragoons and dragoon guards are armed with carbine and sabre, and have metal helmets (except the Scots Greys).

Dragoon Bird. See *UMBRELLA BIRD*.

Draguignan, drâ-gên-yân, France, town, capital of the department of Var; 41 miles northeast of Toulon. It was founded in the 5th century. Pop. 8,645.

Drähms, August, American Congregational clergyman: b. Yarmen, Pomerania, 4 March 1849. His parents emigrated to the United States in 1856, and his early education was received in the public schools of Geneva, Ill. In 1863, he enlisted in the 17th Illinois cavalry and served to the end of the War. He afterward studied at Wheaton College, and the Garrett Biblical Institute at Evanston, Illinois.

DRAGON FLIES.

DRAIN-PIPE — DRAINAGE

and entered the Congregational ministry at Oakland, California, 1878. He is resident chaplain of the state prison at San Quentin, Cal. He has written 'The Criminal: a scientific study; with an introduction by C. Lombroso' (N. Y., 1900).

Drain-pipe, a pipe used in draining, commonly of tile, but sometimes of wood or metal. See SEWER PIPE; TILE.

Drainage, in agriculture, a method of improving the soil by withdrawing the water from it. Though practised by the Romans, and though the value of draining was expounded by Walter Blithe in the middle of the 17th century, it was not till after the middle of the 18th century that the importance of draining began to be understood in Great Britain. The public attention is said to have been then excited by the practice of Elkington, a farmer of Warwickshire, England. But it was James Smith of Deanston, Perthshire, Scotland, who about 1823 led the way in the modern practice of thorough draining.

The successful practice of draining in a great measure depends on a proper knowledge of the various strata of which the earth is composed, as well as of their relative degrees of porosity, or capability of admitting or rejecting the passage of water through them, and likewise of the modes in which water is formed, and conducted from the high or hilly situations to the low or level grounds. In whatever way the hills or elevations that present themselves on the surface of the globe were originally formed, it has been clearly shown, by sinking large pits, and digging into them, that they are mostly composed of materials lying in a stratified order, and in oblique or slanting directions downwards. Some of these strata, from their nature and properties, are capable of admitting water to percolate or pass through them, while others do not allow it any passage, but force it to run or filtrate along their surfaces, without penetrating them in any degree, and in that way conduct it to the more level grounds below. There it becomes obstructed or dammed up by meeting with impervious materials of some kind or other, by which it is readily forced up into the superincumbent layers, where they happen to be open and porous, soon rendering them too wet for the purposes of agriculture; but where they are of a more tenacious and impenetrable quality, they only become gradually softened by the stagnant water below them; by which the surface of the ground is, however, rendered equally moist and swampy, though somewhat more slowly than in the former case.

Where grounds are in a great measure flat, and without degrees of elevation sufficient to permit those over-proportions of moisture that may have come upon them from the higher and more elevated grounds to pass readily away and be carried off, and where the soils of the land are composed or constituted of such materials as are liable to admit and retain the excesses of moisture, they are exposed to much injury and inconvenience from the retention and stagnation of water. Such lands consequently require artificial means to drain and render them capable of affording good crops, whether of grain or grass.

Wetness of land, so far as it respects agriculture and is an object of draining, may gener-

ally depend on the two following causes:—first, on the water which is formed and collected on or in the hills or higher grounds, filtrating and sliding down among some of the different beds of porous materials that lie immediately upon the impervious strata, forming springs below, and flowing over the surface, or stagnating underneath it; and, secondly, on rain or other water becoming stagnant on the surface, from the retentive nature of the soil or surface materials, and the particular nature of the situation of the ground. The particular wetness which shows itself in different situations, in the forms of bogs, swamps, and morasses, for the most part proceeds from the first of these causes; but that superficial wetness which takes place in the stiff, tenacious, clayey soils, with little inclination of surface, generally originates from the latter.

Drains.—The drains used in land drainage may be divided into two classes—open and covered drains. These again may each be subdivided into drains intended merely to act as water-courses, and drains which, in addition to acting as water-courses, are also intended to carry off the surplus water from the land through which they pass.

Open Drains.—The rudest forms of open drains are the deep furrows, lying between narrow highbacked ridges, which are still to be found in some parts of the country, with their accompanying water-furrows ("gaw" furrows or "grips") for discharging their streams. These are only meant to carry off the surplus water after the soil is completely saturated. In doing so, however, they carry along with it all the best portions of the soil, and of the manure which may have been spread upon its surface.

Open Drains as Water-courses.—The ordinary ditch (dike) is the common form of this kind of drain, which, though necessary to a certain extent, ought, nevertheless, to be sparingly seen where a perfect system of drainage has been effected. They are constant sources of annoyance and expense from their sides crumbling in, the numerous weeds which they harbor, and the thorough scouring which they require every year. Open ditches occupy an important place in the early stages of draining bogs; but after the bog has become consolidated the greater portion of them may be dispensed with, and their places supplied by large covered drains.

Open Drains for collecting Water from the Land through which they pass (Sheep-drains).—These are employed in drying the surface of mountain pastures, where a more expensive and perfect system of drainage would not yield an adequate return for the outlay. They consist of trenches of 12 or 16 inches in depth and 18 in width, placed so as to intercept all the water which may flow from portions of land above them. They are opened at intervals in a direction nearly transverse to the line of the greatest slope, and should have just sufficient inclination to keep the water flowing toward the mains or leaders. These latter should be cut in the hollows, or in such other places as will permit the small drains or feeders to empty themselves most readily into them, and be made to discharge into the nearest water-courses.

Covered Drains.—We now come to the consideration of the more important description of drainage—the removal of water by means of

DRAINAGE

covered drains. The simplest of all the forms of these are what are called mole-drains, and they are formed by means of a machine called the mole-plough. This machine consists of a wrought-iron frame on four wheels, the front pair being connected with worm and chain steering. A coulter with pointed sock, capable of being raised and lowered to regulate the depth of the drain, is attached to the frame. The "mole," an oval piece of iron $3\frac{1}{2}$ inches in diameter, follows the sock, to which it is attached by a short chain. The track which the mole leaves in the ground is the water channel. This machine is dragged through the soft clay, which is the only kind of land on which it can be used with propriety, by means of a windlass on the fore end of the frame and a double length of wire-rope wound by an engine on the higher part of the field. A team of horses returns it to the lower side, out of work.

Wedge-drain.—The wedge-drain, like the mole-drain, is merely a channel formed in the subsoil, and, like it, can only be used in pasture lands. In forming wedge-drains, the first spit, with the turf attached, is laid on one side, and the earth removed from the remainder of the trench is laid on the other. The last spade that is used is very narrow, and tapers rapidly, so as to form a narrow wedge-shaped cavity for the bottom of the trench. The turf first removed is then cut into a wedge, so much larger than the size of the lower part of the drain that, when rammed into it with the grassy side undermost, it leaves a vacant space somewhat triangular in shape in the bottom of six or eight inches in depth.

Permanent drains are of two kinds, stone and tile drains.

Stone-drains.—These are either formed on the plan of open culverts of various forms, or of small stones in sufficient quantity to permit a free and speedy filtration of the water through them. As a specimen of the former of these, we may instance the *box-drain*, which is formed of flat stones neatly arranged in the bottom of the trench. The largest and flattest stones are used in laying the bottom and for covers; the smaller ones are placed on the sides, the whole forming an open tube. The second description of stone-drains, generally known as the broken-stone or rubble drain, is not so thoroughly effective as the first.

Tile-drains or Scaver-pipe drains.—Of all the materials which have yet been brought forward for forming the conduits of drains, none are so well fitted for the purpose as tiles or pipes of burnt clay. Draining tiles, especially those in the form of pipes, possess all the qualities which are required in the formation of drains, affording a free ingress to water, while they effectually exclude vermin, earth, and other injurious substances. When first introduced they were of clumsy construction, and being hand-made, sold at a high price. They are now made by machinery, and their expense is very materially lessened. Pipe tiles, which combine the sole and cover in one piece, have been made of various shapes, but the best form appears to be the cylinder. Good pipes are straight, smooth, and free from flaws, and when struck should ring clearly. Durability is shown if the wet pipe will dry quickly before a hot fire without crumbling. Where a sudden descent occurs in the course of a drain, or where there is a run-

ning sand or a boggy place, pipes of one size should either be entirely sheathed in larger ones, or they should be furnished with collars. These collars are merely short sections of pipes of such a size as to fit upon smaller ones, by which means the smaller ones may be so joined end to end as to prevent them from slipping down past each other.

The drawing off of the pent-up waters which are the sources of springs is a department of draining which requires, for its successful practice, a considerable knowledge of the different varieties of strata. When the theory of springs is understood, and a knowledge of the strata obtained, the judicious application of a few simple drains, made to communicate with the watery layers, will often dry swamps of great extent, where large sums of money expended in forming furrow drains in the swamp itself, would leave it but little improved.

In the laying out of drains, the first point to be determined is the place of outfall, which should always afford a free and clear outlet to the drains, and must necessarily be at the lowest point of the land to be drained. This should be ascertained by a beveling instrument; and where a large extent of work is to be done, a competent surveyor should always be employed. The outfalls should be as few as possible, and each one should be carefully set in brickwork and covered by a grid hinged at the top to prevent the ingress of rats and moles, but capable of giving way to a sudden rush of water from the drains above. The next point to be determined is the water level or water table. This may be ascertained by digging test holes in different parts of the field and noticing the height to which the water rises in them. In an undulating field the height will vary in different places, but the knowledge gained by means of the test holes of the nature of the soil and subsoil will indicate the depth of draining required. In general it will be found that in clay land the drains should be shallow and close together, and in sandy or light land deeper and wider apart; the looser nature of the lighter soil permitting the rapid percolation of water, and allowing the drains to draw from a wider area. Drains in arable land must be beyond the influence of agricultural implements; not only out of the reach of plough or cultivator, but too deep to be displaced by their passing weight. Less than two feet six inches from the surface is unsafe, except in very stiff clay pasture land which is never disturbed. The depths usually adopted in practice for the various classes of soils are as follows:

Stiff clay.....	2 ft. 6 in. to 3 ft.
Medium soils.....	3 ft. 3 in. to 3 ft. 6 in.
Light soils.....	3 ft. 6 in. to 4 ft. 6 in.

As to the distance apart, experience has established a rule that in clay soils a drain will "draw" an area of from 5 to 6 times its depth, on medium soils 7 to 9 times, and on light soils 8 to 10 times its depth. Thus 3-foot drains in the first case might be 15 feet apart, in the second 24 feet, and in the third 40 feet apart. Submains may be necessary in an undulating field, and in all cases they are desirable where the minor drains would otherwise be more than 10 chains in length. The rate of fall of any drain must not be less than 1 in 200. All drains should be kept as far as possible from

DRAINAGE

the roots of trees, and curves are to be avoided, except at the junction of minor with main drains or submains, when the junction must form an acute angle, the smaller drain curving towards the larger drain and entering it from above. Two minor drains must not enter a large drain opposite to each other, or the stoppage thus caused will result in the deposition of silt and consequent chokeage of the drain.

Drains are cut from the lowest point upward and the pipes laid in each section day by day. To ascertain if the pipe bed is being laid perfectly true, three leveling staves or "boning" rods are used. Each consists of a staff and crosshead, and by placing them at various points in the drain and sighting over the crossheads, uniformity of the bed is determined. The surface soil in cutting the drains ought to be laid on one side of the trench and the subsoil upon the other side, and each should be returned carefully to its original position. The size of the pipes to be used is dependent upon a number of factors, such as character of soil and subsoil, gradient, rainfall, and length of drains; but in practice it is found most profitable to use 2½-inch to 3-inch pipes for minor drains, and 6-inch, 8-inch, or 10-inch for mains and submains. The number of pipes required per acre is found by dividing the area of an acre in square feet by the distance between the drains in feet, provided the pipes are one foot in length. The following table will be of value in this particular:

Minors	{	Lengths up to 500 feet, 2 in.
		Lengths 400 to 700 feet, 2½ in.
		Lengths 500 to 1,000 feet, 3 in.
Mains	{	2 to 3 acres... 3-inch tiles.
		4 to 6 acres... 4-inch tiles.
		10 to 15 acres... 6-inch tiles.
		20 to 40 acres... 8-inch tiles.
		40 to 100 acres... 10-inch tiles.

The tools used in the formation of drains are few in number, and of a very simple description. They consist of a set of spades—generally three of different sizes—gradually diminishing in width to suit the different parts of drains. For taking out the last narrow spit, to form the seat for the draining pipe, long, narrow, triangularly shaped spades, called bottoming tools, are used. There are also scoops of various widths, furnished with long handles, and rounded or flattened in the soles according as they are required to finish the bottom of the drain for the reception of stones, a horse-shoe tile and sole, or a draining pipe. For the purpose of laying pipes in minor and deep drains an instrument called a pipe-layer, consisting of a short rod attached at a right angle to a long handle, which enables the workman to lay the pipes without going into the drain or reaching the bottom with his hand, is employed. Where the subsoil is strong or indurated, a hand-pick or a foot-pick is required to loosen it before it can be shoveled out.

Benefits of Drainage.—The following are among the benefits arising from thorough drainage:

1. Removal of superfluous water. Not only is the standing water at the surface carried off, but the water-table is lowered, increasing the depth of soil. Energy that would otherwise be required for evaporation of water is thus saved for the immediate benefit of vegetation.

2. Improves soil texture. Drained soils are

more friable, less lumpy, offer less resistance to plant roots, and are of better texture in every way, than undrained soils.

3. Increases root pasturage. Agricultural literature is full of testimony to the benefits of deep tillage. The deeper the soil is stirred the greater its productiveness. Plant roots penetrate to a depth of several feet under favorable conditions such as drainage supplies. Root pasturage is also increased by the increase of surface presented by the much finer division of soil particles.

4. Increases soil fertility. It prevents loss of fertility by water passing over the surface. It adds to the fertility by sending summer showers down through the soil, instead of over them, enabling the crop to use the nitric acid and ammonia brought down. It increases the effect of manures by bringing them more quickly into solution and into more intimate contact with plant roots; and it increases the absorptive power of soils for fertilizing matter in solution.

5. Makes tillage easier. By clearing up waste places and covering ditches the field is brought into better shape for use of labor-saving machinery. Waste land is reduced, and the better texture of soil, its finer tilth and greater friability decrease draft and increase the effectiveness of tillage implements.

6. Lengthens the growing season for crops. Frost comes out earlier in the spring and the land becomes earlier warmed. Evaporation lowers temperature, but drainage removes water without evaporation. A well-drained soil is 12° to 14° F. warmer than a soil full of stagnant water. The sun's rays penetrate to a greater depth, and warm summer showers have a greater effect. The season is lengthened by adding the days in summer after heavy rains when undrained soils cannot be tilled, and crops come to a standstill; coming of the autumn is delayed until later, and the soils are warmer throughout the season.

7. Assists disintegration. Frosts penetrate deeper in winter in drained soils, assisting in unlocking the stores of mineral plant food. More surface is exposed to the action of disintegrating agents, and the soil presents conditions more favorable to their action throughout the season.

8. Favors nitrification and bacterial action. Plants are largely dependent on the decomposition of organic matter in the soil for their supply of nitrogen. This change is brought about by the action of ferments or bacteria which thrive only under certain conditions of temperature and moisture. Drainage supplies the most favorable condition for their development; it also favors the growth of the nitro-bacteria found on the roots of leguminous plants, which by their means appropriate free nitrogen from the air.

9. Prevents heaving. The effect of stool-ice in throwing out young plants in winter is often to diminish seriously and even destroy the crop. Drainage dries up the surface soil and prevents the formation of stool-ice.

10. Lessens washing and diminishes violence of floods. By increasing the absorptive power of the soil less water is left to pass over the surface in a rainy season, so that washing and floods are materially lessened.

11. Improves the quantity and quality of

DRAINAGE TUBES — DRAKE

crops. That the yield of crops is much greater on drained soils hardly needs to be substantiated, while the more vigorous growth of plants renders them much less susceptible to the attacks of fungi or the ravages of insects, thus improving the quality. Rust, mildew, blight, etc., are much less prevalent in crops on drained soils.

12. Diminishes the effect of drought. By making the season earlier tillage can begin sooner and save moisture from wasting. Plants are given a better start and root deeper, thus being less affected by a dry surface. The soil is deeper and has greater capacity for moisture. Its finer texture nearly doubles its capillary power over undrained soils. Ordinarily drainage increases the capillary power of soils from 25 to 40 per cent. A drained soil holds water like a sponge, an undrained clay like a dish.

13. Healthfulness improved. So well known is this fact that large towns have undertaken the drainage of adjacent swamps at public expense to render the region more healthful. See AGRICULTURE; SANITARY SCIENCE; etc.

Among the later authoritative books on drainage: Chamberlain, 'Tile Draining'; Klippart, 'Land Draining'; French, 'Farin Draining'; Miles, 'Land Draining'; Waring, 'Draining for Profit and Health.'

Drainage of Mines. See MINES, DRAINAGE OF.

Drainage Tubes, in surgery, an appliance invented by a distinguished French surgeon, M. Chassaignac. They are composed of india-rubber, from one eighth to three eighths inch in diameter, perforated with numerous holes, and of various lengths. They are introduced into the abscess or wound so that one end is in contact with the seat of discharge, while the other reaches to the surface of the skin. They are especially useful in chronic abscesses, but also in large wounds, such as those made by amputation, and in all cases where there is apt to be a deep accumulation of discharge.

Drake, Alexander Wilson, American artist: b. near Westfield, N. J., in 1843. He became a wood engraver and later taught drawing at Cooper Union, New York. From 1870-81 he was head of the art department of 'Scribner's Monthly' and after 1881 was director of the art department of the 'Century' publications.

Drake, Benjamin, American biographical writer: b. Mason County, Ky., 1794; d. Cincinnati, Ohio, 1 April 1841. He established and for many years edited the 'Western Agriculturist.' Among his publications are: 'Adventures of Black Hawk' (1838); 'Life of William Henry Harrison' (1840); and 'Life of Tecumseh' (1841). The last work is considered of especial historic value.

Drake, Charles Daniel, American lawyer: b. Cincinnati, 11 April 1811; d. 1 April 1892. He served several years in the navy, was admitted to the bar in 1833, and in 1834 took up the practice of law in St. Louis, where he became prominent in politics. In 1864 he was a member of the convention to revise the Constitution of Missouri; in 1867-71 he was United States senator; and in 1871-85 chief justice of the court of claims. He wrote 'Law of Suits by Attachment' (1854); 'Life of Daniel Drake' (1871); and published a collection of his

speeches under the title 'Union and Anti-Slavery Speeches' (1864).

Drake, Daniel, American physician: b. Plainfield, N. J., 20 Oct. 1785; d. Cincinnati, Ohio, 6 Nov. 1852. He was graduated from the University of Pennsylvania in 1815, and settled for a time in Cincinnati. He was professor of materia medica in Transylvania University, Ky., and taught in other medical schools till 1820, when he organized the Medical School of Ohio in Cincinnati; he was professor there, and in the University of Louisville, Ky. He wrote 'Pictures of Cincinnati and Miami County' (1815); 'Practical Treatise on the History, Prevention and Treatment of Epidemic Cholera' (1832); 'Systematic Treatise on the Principal Diseases of the Interior Valley of North America' (1850-4); and was editor of the 'Western Medical and Physical Journal.'

Drake, Sir Francis, English navigator: b. probably in Tavistock, Devonshire, England, about 1540; d. off Porto Bello 28 Jan. 1596. He joined Sir John Hawkins in his last expedition against the Spaniards (1567), losing nearly all he possessed in that unfortunate enterprise. Having gathered a number of adventurers round him he contrived to fit out a vessel in which he made two successful cruises to the West Indies in 1570 and 1571. In 1572 with two small ships he again sailed for the Spanish main, captured the cities of Nombre de Dios and Vera Cruz, burned Porto Bello, captured and destroyed many Spanish ships, crossed the isthmus to the highest point of the dividing ridge, where, climbing a tree from whose tops the guides told him both seas could be seen, he gazed upon the vast waters of the South Seas, and with that touch of romantic enthusiasm that redeemed all his piracies, "besought Almighty God of His goodness to give him life and leave to sail once in an English ship in that sea." Drake arrived in Plymouth on Sunday, 9 Aug. 1573, during sermon-time, when the news of his return "did so speedily pass over all the church, and surpass their minds with desire and delight to see him, that very few or none remained with the preacher, all hastening to see the evidence of God's love and blessing toward our gracious queen and country."

In 1577 he fitted out a small squadron, consisting of his own ship the Pelican, the Elizabeth and three smaller vessels, and with these sailed from Plymouth on 13 December. On 20 August the squadron, now reduced to three ships, entered the Strait of Magellan, and here Drake changed his own ship's name from the Pelican to the Golden Hind. In 16 days they made the passage, then followed violent tempests for 52 days, during which the Marigold foundered with all hands and the Elizabeth parted with the admiral and resolved to return home. At Valparaiso Drake provisioned his ship from the Spanish storehouses, reached Callao on 15 Feb. 1579, found a rich prize off Cape Francisco (1 March) and another on 4 April. Drake now determined to return home by crossing the Pacific. He touched land at a creek on the northern side of the Golden Gate, then for 68 days together had no sight of land until he made the Pelew Islands. After refreshing three weeks at Ternate, and a thorough refit on the southwest coast of Java, he held for the Cape of Good Hope, and arrived in England 26 Sept. 1580

DRAKE

The queen paid a visit to his ship at Deptford, and knighted him on its deck.

In the autumn of 1585 Drake sailed with a fleet of 25 ships against the Spanish Indies, harrying Hispaniola, Cartagena, and the coast of Florida, and brought home the 190 dispirited Virginian colonists, with tobacco and potatoes. Early in 1587 he set sail with a strong squadron to cripple the king of Spain in his own seas, and retard his preparations for invasion—a sport which he called “singeing the king of Spain’s beard.” Sailing right into the harbor of Cadiz, he sank or burned as many as 33 ships, and made his way out unscathed. The seeming recklessness of his tactics was no devil-may-care bravado, but due to consummate seamanship no less than promptitude and courage. Drake next sailed to the Azores, capturing a rich homeward-bound Portuguese carack worth £100,000. In the face of the impending struggle for which Philip II. had long been preparing, his persistent plan was to follow up the policy of harassing the enemy on his own coasts—“to seek God’s enemies and her majesty’s where they may be found.”

Drake’s division in the three-fold arrangement of the English fleet was at first stationed off Ushant, until all the ships were blown together to Plymouth by the same storm that carried the Spaniards across the Bay of Biscay. Here, on the Hoe, the admirals and captains were playing the famous game of bowls, when the news was brought that the enemy was off the Lizard. Howard was eager to put to sea at once, but Drake would first finish the game, saying “there’s plenty of time to win this game, and to thrash the Spaniards too.” The story, whether true or no, is in perfect keeping with the character of the man. Early next morning the battle began, and raged along the Channel throughout the week. Drake’s consummate seamanship and audacious courage covered him with fresh glory, and inspired new terror in the Spaniards. On 29 July occurred the final action so disastrous to the Spaniards, after which they came to their fatal determination to return to Spain round the Orkneys. Two days later Drake wrote to Walsingham: “There was never anything pleased me better than the seeing the enemy flying with a southerly wind to the northward. God grant you have a good eye to the Duke of Parma, for with the grace of God, if we live, I doubt it not, but ere it be long so to handle the matter with the Duke of Sidonia, as he shall wish himself at Saint Mary Port among his orange trees.” It was not long before want of ammunition compelled Drake and Howard to fall back from the chase, but the storms of the northern seas took up their work and swept the Spaniards to destruction. Next spring a great expedition under him and Sir John Norreys sailed for the coasts of Spain and Portugal, but had little success beyond the damage inflicted upon the Spanish shipping, while sickness and actual hunger carried off thousands on board the crowded and ill-victualled ships. In August 1595, he sailed from Plymouth on his last expedition to the West Indies. Ill-fortune followed the fleet from the beginning; Hawkins, the second in command, died off Porto Rico in November, and Drake himself fell ill and died off Porto Bello. See the *Life by Barrow* (1843); Froude, ‘English Seamen of the 16th Century’ (1895);

Julian Corbett, *short Life* (1890); and his ‘*Drake and the Rise of the Tudor Navy.*’

Drake, Francis Marion, American capitalist and lawyer: b. Rushville, Ill., 30 Dec. 1830; d. Centreville, Ia., 20 Nov. 1903. In 1837 his family moved to Iowa, where he was educated. In 1852 he crossed the plains to California with ox-teams, encountering and defeating a band of Pawnee Indians on the route, and in 1854 crossed again with a drove of cattle. In 1855 he engaged in mercantile business in Drakeville, Ia., and in 1861 entered the army as a private. He served through the Civil War, attaining the rank of brigadier-general of volunteers. After the war he studied and practised law, and engaged in the railroad business, particularly the building of new roads. He was the first president of the Missouri, Iowa & Nebraska R.R., and was later president of the Albia & Centreville R.R. In 1880 he founded Drake University (q.v.) which he liberally endowed, and was president of the board of trustees till the time of his death. He was one term (1896–8) governor of the State of Iowa, being elected on the Republican ticket.

Drake, Francis Samuel, American historical writer: b. Northwood, N. H., 22 Feb. 1828; d. Washington, D. C., 22 Feb. 1885. He was a son of S. G. Drake (q.v.). He prepared a ‘*Dictionary of American Biography*’ (1872). He also published: ‘*Life of Gen. Henry Knox*’ (1873); ‘*Tea Leaves*’ (1884); and ‘*Indian History for Young Folks*’ (1885). Before his death he had gathered material for a new edition of his ‘*Dictionary*,’ which was incorporated in ‘*Appleton’s Cyclopædia of American Biography.*’

Drake, Friedrich, frēd’rīn drä’kē, German sculptor: b. Pyrmont, 23 June 1805; d. Berlin, 6 April 1882. Among his principal works are ‘*The Eight Provinces of Prussia*’ (colossal allegorical figures adorning a hall in the royal palace at Berlin), and a ‘*Warrior crowned by Victory*,’ which is reckoned one of the masterpieces of German sculpture.

Drake, James Madison, American journalist and soldier: b. Somerset County, N. J., 25 March 1837. He early engaged in newspaper work and served in the Union army throughout the Civil War, unfurling the first Union flag on Virginia soil 24 May 1861. After the war he settled in Elizabeth, N. J., and published there the *Daily Monitor* (1868–81), the ‘*Sunday Leader*’ (1882–7), and *Daily Leader* (1887–1900). He has written: ‘*Fast and Loose in Dixie*’ (1880); ‘*Across the Continent in Red Breeches*,’ etc.

Drake, Joseph Rodman, American poet: b. New York 7 Aug. 1795; d. there 21 Sept. 1820. He studied medicine, traveled in Europe, and after his return in 1819 contributed under the signature of “CROAKER” many pleasant and effective verses to the *New York Evening Post*. His friend Fitz-Greene Halleck joined him in this series, signing his own pieces at first “Croaker, Jr.” but soon they both adopted the signature of “Croaker & Company.” The novelist Cooper was also one of the intimate associates of Drake and a conversation between them as to the poetical uses of American rivers, in the absence of historical associations, such as belong to the streams of the old world, was the occasion of Drake’s longest and most imaginative poem, the ‘*Culprit Fay.*’

Drake, Samuel Adams, American journalist and writer: b. Boston, 20 Dec. 1833; d. Kennebunkport, Me., 4 Dec. 1905. He entered journalism in 1858. In 1861 joined the army and served throughout the War, becoming brigadier-general in 1863. He returned to Boston in 1871 and resumed literary work. His most important publications are: 'Old Landmarks of Boston' (1872); 'Around the Hub' (1881); 'New England Legends' (1883); 'New England Legends and Folk Lore' (1884); 'The Making of New England' (1886); 'The Pine Tree Coast' (1891); 'Our Colonial Homes' (1894); 'The Border Wars of New England' (1897); 'The Myths and Fables of To-day' (1900), etc.

Drake, Samuel Gardner, American anti-quarian: b. Pittsfield, N. H., 11 Oct. 1798; d. Boston, Mass., 14 June 1875. He published 'Indian Biography' (1832); 'Book of the Indians' (1833); 'The History and Antiquities of Boston' (856); 'History of the French and Indian War' (1870), etc.

Drake University, a coeducational institution in Des Moines, Ia.; founded in 1881, under auspices of Church of Christ. Named for Gen. Francis Marion Drake, its chief benefactor, whose gifts amounted to \$230,000, and who served as president of the board of trustees from the board's organization until his death, 20 Nov. 1903. Linked with the name of Drake as founder, is the name of D. R. Lucas, through whose influence the institution was located in Des Moines, and that of George Thomas Carpenter, its first chancellor and the moving spirit of the new enterprise. Total assets of the university, \$530,000. Available income about \$90,000 annually. There are eight organized colleges: Liberal arts, Bible, law, medicine, normal, conservatory of music, pharmacy, dentistry. Also eight special schools. Enrollment for year 1903-04 was 1,507. General control is vested in board of trustees, composed of (1) life members; (2) members elected by Iowa Christian Convention; (3) members elected by Alumni Association. President of the university, under direction of board, is head of the school.

Drama, a term taken from the Greek, literally signifying action, and applied to that form of literature intended primarily for presentation upon the theatrical stage. A production may be dramatic in form, and yet through lack of conformity, intentional or otherwise, to theatrical requirements, may belong to the class known as closet dramas. Dramatic literature during the greater part of its history has constituted one of the three great classes of poetry, epic and lyric verse being the other forms; but modern usage admits of prose as a vehicle of expression in the drama. The drama is commonly divided into two great branches, tragedy and comedy,—the former presenting the serious problems of human character and conduct, with deeds and circumstances trending toward a fatal issue; the latter depicting the bright and humorous side of life. Dramatic performances of some kind have been known probably among all nations, and seem generally to have been connected in their origin with religion. Compositions of a dramatic nature are found in the Old Testament, for example, in Job and the Song of Solomon.

Oriental Drama.—The forms of national drama developed in India and in China are

worthy of note among Oriental literatures. Chronologically they follow the drama of Greece, but lack the historic connection with modern drama, characteristic of the latter, and may be regarded independently. The Hindu drama, like the Greek, grew out of certain features of religious festivals, but contrasts strikingly with it in the lack of tragedy. The most famous specimen of Hindu dramatic literature is the 'Sakuntala' ('The Lost Ring') a seven-act drama by Kalidasa, the greatest of Hindu dramatists, and celebrates a romantic love episode. The date is uncertain, but the tendency of modern critics is to place the era of Kalidasa at least as late as the 4th century of the Christian Era. Another play by the same author is 'Vikramorvasi' ('The Hero and the Nymph'). In China the flourishing period of the drama appears to have been from the 13th to the 14th century. Chinese plays are very formal. They represent both humorous and heroic situations, but cannot strictly be divided into comedy and tragedy.

Greek Drama.—Incomparably the most interesting ancient dramatic literature is that of Greece, both for its intrinsic value and because of its relation to the drama of other European countries. At first the drama among the Greeks was by no means so distinctly separated from the epic and lyric poetry as we find it at a later period. Both forms, tragedy and comedy, took their rise in the celebrations of the festivals of the god Dionysus (Bacchus), at which hymns and chants were sung by choruses in honor of the deity; and the chorus continued to be a prominent feature of the old Greek drama. Tragedy is generally ascribed to Thespis about 530 B.C. No specimens of the earliest age of Greek drama, that is to say, of the compositions, either purely dithyrambic or consisting of choric songs interspersed only with monologue, which are supposed to have prevailed in the infancy of the art, now survive. The earliest examples, the dramas of Æschylus, whose chief predecessors were Phrynichus, Chœrilus, and Pratinas, exhibit the drama in a very advanced condition, so far as the particular style goes. Though in the earliest examples not more than two actors were permitted to be present as speakers on the stage at the same time, the dialogue is managed so as to unfold a varied and completely dramatic story; while the chorus, either as a whole or subdivided into sections, performs its lyrical odes, and, when necessary, takes part by its leader, and rarely by other members, in the spoken portions. The almost immediate addition of a third speaking actor, which, whether due to Æschylus himself or not, appears in his later plays, is practically the only change of importance subsequently made; and this was not as a rule further extended in Greek tragedy, that is to say, in the works of the three great writers, Æschylus, Sophocles, and Euripides. Very rarely the *quarta persona* or something like him appears, but this is a mere exception, and unimportant. The plays were for the most part, arranged in trilogies or sets of three, sometimes followed by a fourth play of a quite distinct and comic or satiric character. With each new play the restrictions of the unities were relaxed, or rather disappeared altogether, and a fresh time, a fresh place, and an only distantly connected scheme of action could be entered upon. These unities, which at various times have been the subject of sharp contro-

DRAMA

versy, appear to be less *à priori* rules which the authors had before them than generalizations deduced and formulated from the practice of these authors. Some slight and some serious deviations from them have been observed, but on the whole they were rigidly observed. Generally speaking, the unity of time rules that not more than 24 hours are to be supposed to pass; the unity of place, that the scene shall not be changed; and the unity of action, that nothing like an independent underplot shall be permitted, every incident, and practically every speech, being subordinated to the main argument. When these strict conditions were taken with the exact and (in the case of the choruses) intricate metrical structure of the verse, they set Greek tragedy at the head of all literary performances as an example of exquisite symmetry of form, severe in its proportion. It is, however, almost as remarkable that, at least in Æschylus and Sophocles, no deficiency of dramatic interest attends this severity of form. Euripides is in this respect far inferior. Even in the earliest examples the metrical arrangements are consummate. The magnificent poetical quality of Æschylus, the sense of overmastering fate with which he manages to charge all his drama, and the perfect humanity of Sophocles, relieve their work entirely from the charge of sterility which has been brought against more modern imitations of their form. The subjects of Greek tragedy were limited to poetical and heroic tradition, with a certain admixture of what in modern literature we should call the chronicle-play, or drama of contemporary event. The extant example is the 'Persæ' of Æschylus; an exceedingly interesting play, because it shows the ease with which the Greeks could achieve what has baffled almost all moderns. Greek comedy is supposed to have commenced about 580-560 B.C. with Susarion, who is said to have traveled from place to place holding up to ridicule, on a small movable stage, the follies and vices of his age. By degrees the lyric element in comedy gave way to the dramatic, and the comic drama assumed the form familiar to us from the plays of Aristophanes (q.v.), whose 'Knights' appeared probably about 424 B.C. If it were not for the limitations of the female characters which Greek manners necessitated, Aristophanes would perhaps have been the equal of Shakespeare in comedy. As it is, he is unequalled in the class to which belong, with the play just mentioned, 'The Frogs' and 'The Clouds.' The old comedy of the Greeks was thoroughly national, with much of a political tendency. At the end of the Peloponnesian war (404 B.C.), Greek comedy received a new character and form, and "middle comedy," so called, began. It was strictly forbidden to bring living persons by name on the stage, and the chorus, till then the chief instrument of vituperation, was abolished; while, with the representation of general characters, corresponding masks were introduced, instead of those imitating the countenances of particular individuals. Even Aristophanes was obliged to submit to these regulations in his last plays. To the new comedy of the Greeks, which formed the next development, belongs Menander, 342-291 B.C., who by the keenness of his wit and the regularity of his pieces began a new period, the Greek comic drama. It may be said in general that Greek genius elaborated the stock comedy of certain general types of

character, so that in spite of great changes in manners, no original addition has since been made with the exception of what was contributed by Molière.

Roman Drama.—The Latin race, lacking the æsthetic temperament that distinguished the Greeks, accomplished little of importance in dramatic literature. The Romans as a people found more attraction in pantomimic shows and such spectacles as gladiatorial contests and the games of the circus than in the drama. The earliest specimens of the drama in Italy were the Atellan plays, so called from Atella, a city of the Oscans. These were farces or pieces in which broad buffoonery prevailed. The regular drama among the Romans was a mere imitation of that of the Greeks, Livius Andronicus, Ennius, and Pacuvius being the earliest writers of Roman tragedy. Plautus and Terence, a number of whose plays have come down to us, were imitators of the new Greek comedy. Their works have been the basis of many modern imitations or adaptations. The plays of Terence are distinctly literary works, probably following as closely as was feasible the Greek originals. The work of Plautus, although perhaps scarcely less indebted to Greek comedy for plots and incidents, displays a strong infusion of vernacular character with more of a distinctly Roman flavor to the humor. The fault of Terence's work is thinness; of that of Plautus, coarseness. Of Roman tragedy, the dramas attributed to Seneca are the only specimens extant. They are pretty obviously closet drama, that is, whether they were ever acted or not they were written as literature and not as playwright's work. Their importance lies in their influence upon the tragedy of the Renaissance. Italy and France felt that influence deeply, and if English taste had welcomed the innovation the stamp of Seneca would have been placed upon her literature also.

Drama of the Middle Ages.—The early Dark Ages produced nothing worth speaking of, while the Terentian comedies of the nun, Roswitha (q.v.), stand by themselves, and are little more than literary *pastiches*. Such dramatic entertainments as survived were attacked by the clergy as heathenish, immoral, and indecent exhibitions. When the drama reappears, it is connected as before with the offices of religion, though the precise extent to which this connection reached is a matter of much debate. About the 11th century in France appear the beginnings of the famous miracle or mystery play, which has sacred subjects only, is in its earliest forms very short, and consists for the most part in the representation "by personages," as the vernacular phrase went, either of scenes from the Bible or of legends of the saints. This kind of drama, which is still represented in a modified form by the famous Ammergau passion-play, was extremely popular; and though later in other countries than in France, has tolerably early representatives in most of them, especially in Germany and England. France, however, was its special home. As early as the 13th century a single French author, Adam de la Halle, originated, so far as is known, two important styles, the comic opera (in 'Robin et Marion') and the modern comedy, in the half autobiographic composition called the 'Jus' ('Jeu,' 'game') 'Adam' or 'Jus de la Feuillie' ("of the booth"). Of these compositions the former has hardly a trace of roughness, while the latter

DRAMA

contains no hint of classical inspiration. By the 14th century France had added to the miracle or mystery, which branched out into the "profane mystery" or chronicle-play dealing with current events or ancient history, not merely the farce—the dramatization of the earlier verse *fabliau* or comic story, and the "morality"—an allegorical play of virtues, vices, and the life of man generally, to which the general mediæval passion for allegory gave great vogue; but also the *satire* or political farce, as well as not a few minor varieties. The passion for dramatic entertainments was very great and societies or guilds existed for their performance.

Italian Drama.—Great as are the performances of Italy in European literature, her achievements in drama are of little moment, when compared with the towering fame of Dante and Petrarch, of Ariosto and Tasso. Her chief influence was to direct France into following the Senecan tragedy, and, through a writer who took the French name Larivey, but who was really a Giunti, the Terentian comedy somewhat relaxed. No Italian mediæval work for the stage is in the least remarkable; but as soon as the Renaissance dawned, certain writers, Trissino especially, adopted the stiff form of tragedy already referred to, the earliest noteworthy tragedy in Italian being his 'Sofonisba' (1515). Macchiavelli, Cardinal Bibbiena, and the great Ariosto, attempted comedy. The Italian pastoral drama sprang from the ancient idylls, and aimed at a fanciful delineation of Arcadian and mythological scenes. It gave birth to the lyrical drama, which under the name of opera, was from Italy to conquer Europe, and to push drama proper much out of favor. It was a little restored by a group of learned writers in the late 17th century, the chief of whom was the Marquis Maffei, a soldier, an antiquary, and a playwright, whose 'Merope' Voltaire followed very closely. Goldoni and Gozzi started the school of comedy which was to a great extent a reflection of national manners, and has real distinction. Whether as much can be said of the formal lyric dramas of Metastasio in the middle, or of the tragedies of Alfieri at the end of the 18th century, is perhaps a matter of taste. In spite of the high rank that has been accorded the latter, neither he nor any other writer of Italy has succeeded in drama, since the school of Venetian comedy, in striking what may be called an original note, though during the 19th century Manzoni and others attempted the style.

Spanish Drama.—In Spain, no mediæval performances of much merit are cited by historians; but instead of being diverted by the Renaissance into a mere following of classical models like France and Italy, the Spaniards showed independence almost equal to, and an immediate command of form far greater than, that of the English theatre itself. In part they continued the religious tradition by their *autos*, or sacred plays; in part they diverged into romantic drama of the freest kind; and they almost invented for themselves the comedy of fashionable life and intrigue which was imitated freely by all the great playwrights of the 17th century in other countries. They furnished in the 'Don Juan' (q.v.) story one of the most fertile dramatic motives of Europe, and in Lope de Vega and Calderon they produced dramatists not equaled in fertility anywhere, and surpassed in genius only by the greatest names of the world.

Half at least of the most famous plays of the French classical period are more or less directly borrowed from Spain, and England also pillaged in her turn. But the period of Spanish dramatic productiveness was unfortunately as short as it was brilliant; and it has had no revival. What the Spaniards did for Europe in dramatic matters was to develop a fertile and powerful drama in complete defiance of classical traditions, to show the dramatic possibilities of the supernatural, and to push almost to the farthest extent the comedy of ingenious surprises, and "wheels within wheels." Cervantes' tragedy of 'La Numancia' has fine qualities, and Moreto, a disciple of Calderon, in his day divided the favor of the public with the greater dramatists.

French Drama.—As has been noted, the passion for scenic representation as illustrated by the mediæval drama, developed in France earlier than in any other European country and the change to the dramatic form of the Renaissance was nowhere more marked. The first influence which led to the creation of the new drama came, as has been said, from, or rather through Italy. It is at first sight surprising that so vigorous and racy a kind as the indigenous comic drama of France had already shown itself to be, should be supplanted by a merely learned and literary importation. Nor in fact was it so, except in Paris and one or two other centres of culture, while even there it was not completely banished until the genius of Molière, which long exercised itself in something very like the ancient farce, effected a combination between the vernacular, the Terentian, and the Spanish comedy. In tragedy, however, the school commonly called the Pleiade—that is, the poet Ronsard and his set—effected a complete revolution, following the Senecan model. The two plays of Jodelle, 'Cléopâtre' and 'Didon,' set the example of a tragedy exactly resembling those attributed to Seneca. This style of tragedy was continued for many years, and was cultivated by Robert Garnier and Antoine de Montchrestien among others. In the hands of a later school, of whom Alexandre Hardy was the chief, a great infusion of Spanish romanticism took place. Yet the scheme of the tragedy was not much altered, whatever might be the case with the treatment, when Rotrou and Corneille at last formed the French classical tragedy proper. Whatever may have been the repressive influences exerted upon Corneille by the Academy the original strength of his great genius has made his name stand as that of a liberator of French thought and literary expression. It is of interest to note the presence in his 'Cid' of the Spanish influence. In his early work, Racine followed Rotrou, Corneille and Quinault, but in 'Andromaque,' he struck a new note which was brilliantly sustained. Comedy underwent a change less marked than that in tragedy. In this Scarron's share must not be overlooked. The great debt of the French drama was owing, however, to the three great masters, Corneille, Racine, and Molière (qq.v.). As produced by these men, and by imitators in the second half of the 17th century, both tragedy and comedy assumed shapes which France long retained unaltered, and which for a time gave law and pattern to all Europe except England, and even to some extent there. The tragedy was of the Senecan kind, with a slight relaxation of some of the minor stringencies,

DRAMA

but with the unities for the most part maintained, and with, as a rule, the fortunes of a love affair substituted for the classic themes of fate and inherited doom. Comedy was less restricted. It might be written either in prose or in verse; the unities of place, and even to some extent of action, were neglected or construed loosely. A great variety of interest and subject matter was admitted, and the elaboration of really witty dialogue supplied endless opportunities of ornament. At the same time, in the hands of Molière nearly always, though less often in those of his followers, the moral or satirical purpose was carefully observed. The reign of these two kinds continued with little interruption till the end of the first quarter of the 19th century. In tragedy, Crébillon the elder succeeded in raising the style to something not far below Corneille's level, while Voltaire, applying his own singularly various and versatile talent to it, and enlarging the range of subject and situation, produced work which ranks as drama, though not as poetry, almost with the work of Corneille and Racine itself. In comedy, the level continued higher, very excellent work of the Molièresque kind, slightly altered in various ways, being done by Destouches, Marivaux, Piron, and others; while toward the middle of the 18th century, a sort of third or bastard kind, variously called as it approached one extremity or the other, *comédie larmoyante*, or *tragédie bourgeoise*, was introduced by La Chaussée, Sedaine, Diderot, and their contemporaries. Under the generic name of *drame* this may be said to have important representatives at the present day. It tended naturally to emancipate itself from the restrictions of tragedy, and so no doubt helped the great revolt of what is called the "romantic movement," which about 1830 practically destroyed the old French tragedy, and seriously interfered with the Molièresque tradition of comedy. The leader of the new school, Victor Hugo (q.v.), challenged the classicists by his "Hernani," which had the effect of literary dynamite. The alteration introduced a great amount of dramatic literature of much higher value than had been produced since the latter half of the 17th century. France once more became the central seat of drama in Europe, and foreign nations have freely adapted her productions. At the same time it must be confessed that tragedy proper has continually dwindled, and that even comedy of the higher kind has been somewhat injuriously affected. Among modern French dramatists may be noted Dumas, père (another leader of the romantic movement), De Musset, Augier, Scribe, Legouvé, Sardou, Dumas, fils; Coppée, Richepin and Rostand. The Belgian drama scarcely requires as yet to be treated independently of the French to which it has been considered an adjunct. Its most striking examples, the work of Maeterlinck, belong to the Parisian stage, representing there the new symbolism.

German Drama.—Of the great literary European nations, Germany has on the whole contributed least to the European drama, though one dramatic motive, the Faust story, is due to her, and though at two distinct periods, the middle of the 16th and the junction of the 18th and 19th centuries, the supernatural drama, of which this Faust legend has given the chief example, exercised, mainly through German impulse, great influence abroad. Otherwise the

Germans have been, save for one brief period, more remarkable for assiduous cultivation of the art of acting, and the theory of the stage, than for the production of great dramatic work. It was not till the middle of the 18th century that Lessing, not so much by his actual dramas as by his critical discussions of the drama and dramaturgy generally, earned for himself a really great place in dramatic history. At the end of that century what has been called the "Storm and Stress" school flooded Europe for a time with extravagant or sentimental productions of the class of which Schiller's "Robbers" and Kotzebue's "Menschenhass und Reue" ("The Stranger") are the most famous examples in two different kinds: while the first mentioned is perhaps the best, and the second one of the worst in literary merit. Kotzebue, indeed, was a very popular dramatist everywhere for a time. Schiller calming down from the state of mind out of which grew his "Robbers," produced a series of plays which to the Anglo-Saxon taste suffer from a too close approximation to the French style, while, according to classical standards, they err by dramatic license, but which nevertheless contain much noble poetry and some striking drama. In this same style Goethe's "Egmont" far surpasses anything of Schiller's, except the splendid chronicle-play of "Wallenstein," while his "Iphigenie in Tauris" is (if we disregard Milton's "Samson") the only modern classical drama which is really classical, and his "Faust" is not only one of the great works of European literature, but includes rather than constitutes some of the finest dramatic work to be found out of Shakespeare. Among the 19th century dramatists were Iffland, Körner, and the romanticist Tieck; and the 19th century has given among other minor dramatic works the plays of Hauptmann known as "dream-poems."

Dutch Drama.—Among the Dutch the drama began with the classical tragedies of Koster, known as the "Father of the Amsterdam theatre," and its highest point was reached by van den Vondel, the "Dutch Shakespeare." The national drama afterward reflected the change in French dramatic literature.

Scandinavian Drama.—In Denmark dramatic history begins with vernacular plays of the school-drama class extending through the 16th and 17th centuries. In Sweden, where such works held a nearly corresponding place, the plays of Messenius mark the beginning of national drama in the early part of the 17th century. The opening of the first Danish theatre in Copenhagen (1722) for which Holberg's comedies were written, marks the breaking away from French influence (till then dominant on the stage) which Wessel's "Love Without Stockings" aided in abolishing half a century later. Heiberg followed; then Ohlenschläger, a disciple of the German romantic school. In Sweden the revolt to romanticism came early in the 19th century. To late Scandinavian drama, Norway has contributed the works of Ibsen and Bjornson, dealing with social problems; the former's challenge to conservatism having won world-wide attention.

English Drama.—In England the drama was, except the German, the last to crystallize itself into a determined form, and while that form has on the whole maintained itself, various foreign influences have successively exercised

DRAMA

more or less force there. In England, as elsewhere, the miracle-play existed, and divers collections of it, known as the York, Digby, Townley, Chester, and other collections, have been preserved and published. But these are both later and ruder than the French examples. Nor does the drama seem to have taken in mediæval England, until quite the beginning of the 16th century, anything like the various extensions which it received in France. From this period we have a sufficient variety—interludes, moralities, mysteries, the most important composer being John Heywood. The great and original school, commonly known as that of the Elizabethan dramatists, did not, however, arise till the last quarter of the century. Among the somewhat formless dramatic products which preceded it, without as far as can be seen giving this great group of playwrights much help of pattern or precept, it is usual and proper to distinguish three pieces—‘Ralph Roister Doister,’ by Nicholas Udall; ‘Gammer Gurton’s Needle,’ assigned to Bishop Still; and the tragedy of ‘Gorboduc,’ or ‘Ferrex and Porrex,’ by Sackville the poet and Thomas Norton. The first and second are comedies, or rather farces, the second of ruder type than the first, but both exhibiting a considerable advance from the mere interlude toward comedy proper. The third is after the style of Seneca—a style which, attempted also by Edwards, by Daniel, and by the Countess of Pembroke, was obstinately resisted by the English genius, and took no root. It is not possible to assign any foreign origin to that school of English drama, which, suddenly appearing in the work of the so-called “university” group, of Marlowe, Greene, Peele, and in a rather different vein, Lyly, passed into the far more capable hands of Shakespeare, Ben Jonson, Chapman, Dekker, Beaumont and Fletcher, Webster, Middleton, Thomas Heywood, Massinger, Ford, and Shirley. These were the master-dramatists of the world, and the so-called Elizabethan school closed with the death of Shirley (1666). At this time the two great ethical defects of the whole school, the unnecessary horror of its tragedy, and the unnecessary foulness of its comedy, had reached their highest point. When after the Restoration tragedy revived it assumed a different style. Partly influenced by the admiration of things French, but more by the fact that D’Avenant had been enabled by Oliver Cromwell’s love of music to introduce even during the Commonwealth a sort of musical drama, there came in what are called “heroic” plays, the chief formal characteristic of which is that they are written in rhymed couplets. These held the stage for about 20 years, their chief writer being Dryden, with Crowne, Otway, Lee, and others following him in tragedy, and Shadwell, Crowne, Otway, Etheredge, Wycherley, and others in comedy. At last Dryden himself returned to blank verse, and produced in it the last really fine examples of English tragedy, properly so called, for the work of Rowe and Congreve in this kind is not noteworthy. The licentiousness of the Restoration drama was a marked feature, and has hardly been equaled in any other European country. The 18th century produced nothing of value, and all the attempts that have been made since at pure tragedy on the English stage have been merely literary work, or a kind of *drame*, or performances of

scarcely any literary merit but of some stage adaptability.

No such fate for a long time befell comedy. Etheredge and Wycherley, the two chief writers of the new school, may be said to have adjusted the old humor comedy of Jonson, and the bustling lively comic work of Fletcher, to the change of manners, the greater demand for literary style, and the example of Molière. Following them, in the reign of William of Orange and that of Anne, Congreve, Vanbrugh, and Farquhar carried this altered style to almost its highest possible perfection. All their work was, however, marred by a singular brutality of thought, even in the rare cases where this was not coupled with an equal coarseness of language. For a long time the public demanded, enjoyed, or tolerated this; but at length taste changed, and the famous paper war, which had begun with Jeremy Collier’s attack on the stage, undoubtedly did much to purify English comedy. It did not strengthen it, and nothing in the way of comic dialogue has since been produced which equals the best scenes of Vanbrugh and Congreve. Much comic work of merit was produced, until the time of Goldsmith. His two masterpieces were followed at no very great interval by the famous work of Sheridan, in which the methods of what may still be called Restoration comedy are adapted to altered tastes in literature and morals with surpassing skill. Sheridan is the last great name in the English drama. With rare intervals the works of Shakespeare have kept the stage; but all the other old tragic dramatists have become obsolete, and, excepting Goldsmith and Sheridan, the old comic writers have shared the same fate. Successive schools of dramatic writing have had their day of favor, sometimes owing to the predilections of certain popular actors. The most important, probably, of strictly 19th century English playwrights was Lord Lytton. Yet the ‘Lady of Lyons,’ ‘Money,’ ‘Richelieu,’ etc., though usually effective on the stage, can scarcely be said to be so to the reader, while on the other hand, the dramatic works of Byron, Coleridge and Taylor, of Tennyson, Browning, Landor, Horne, and Swinburne, belong to closet drama.

Among the minor dramatists whose work, even if in some cases very ephemeral, is at least prominent for successful acting qualities—may be named Jerrold, Brooks, Tom Taylor, J. W. Marston, Wills, Robertson, H. J. Byron, Boucicault, Grindy, H. A. Jones, A. W. Pinero, Chambers and Stephen Phillips.

Of the drama of other European countries it may be remarked that they have not shown even in the period of freeing themselves from the domination of the classic French school and responding to the romantic movement, such originality or brilliance as compels the world to lend an ear. To Russia, where Pushkin, Griboyedoff, and Ostrovski, have done work of importance, or at least of interest, we may look for a future drama that stands on a level with her school of fiction.

American Drama.—The history of the drama in the United States has more to do with players than with plays, for the work of American dramatists has been of small value, lacking in originality, in large themes and in literary construction. We have no dramatist worthy of the name; rather we have a school of brilliant

DRAMATIC ARTS—DRANESVILLE

translators, imitators and adapters. Early stage productions were of English plays and not until 1787 was an American play by an American author produced. This was 'The Contrast,' written by Royall Tyler, afterward chief justice of Vermont, and can be very briefly described as a patriotic trifle. The first prolific American dramatist, William Dunlap, flourished from 1798 to 1815, with half a hundred plays to his credit. Not until 1820, when Edmund Kean visited this country did the people look with favor upon the drama. When Edwin Forrest made his appearance in New York in 1826, he produced two tragedies by native writers, 'Metamora,' by John A. Stone, and 'The Gladiator,' by R. N. Bird. Dion Boucicault, who wrote 'Rip Van Winkle,' and other English actors, who were also playwrights, made American tours and remained here to stimulate the drama, but until the close of the Civil War, the American stage was dependent upon England for her plays, her players, and her playwrights. Augustin Daly was among the first to encourage the American playwright. He maintained a company of superior players and was in hearty sympathy with a purely American drama.

The nearest approach to a purely American drama had its inception in the work of Bartley Campbell (b. 1843; d. 1888). He produced 'My Partner,' a western melodrama, in New York, in 1879, with remarkable success. This was followed by 'Fairfax' and 'The Galley Slave,' and later by 'Matrimony,' 'The White Slave,' 'Siberia,' and 'Paquita.' Several of his plays were produced in England with the same success that had been accorded them in this country. Bronson Howard, a contemporary of Campbell, was the author of a dramatic composition called 'Fantine,' which was played in Detroit as early as 1864. His first important play, 'Saratoga,' was produced by Augustin Daly in 1870. Other plays by Mr. Howard gave him a foremost position among American playwrights. His best-known plays were 'The Banker's Daughter' (1878); 'Old Love Letters' (1878); 'Young Mrs. Winthrop' (1872); 'One of Our Girls' (1885); 'The Henrietta' (1887); 'Shenandoah' (1889); 'Aristocracy' (1892). Several of these plays were produced in London, and 'Saratoga' was played in Berlin by Paul Lindau. A third American among the earlier successful playwrights was Henry C. DeMille (1850-93). Augustine Daly was also a successful playwright. His first play, 'Delmar's Daughter,' was produced in 1883. Then followed 'The Main Line,' 'Lord Chumley,' 'The Charity Ball,' and 'Men and Women.' 'The Wife' was written in collaboration with David Belasco, and was played at the Lyceum theatre (1887). Other American playwrights who have won distinction include David Paul Brown, Augustus Thomas, who wrote 'Arizona' and 'Alabama'; William Gillette, author of 'The Private Secretary,' George H. Baker, Epes Sargent, Henry Guy Carleton, Charles H. Hoyt, Madeleine Lucette Ryley, David Belasco and Clyde Fitch.

A phase of the drama in America is the adaptation of the historical novel, which had its genesis in the stage production of 'Uncle Tom's Cabin.' The so-called rural plays, like Denman Thompson's 'Old Homestead,' are thoroughly national in plot and character and have met with phenomenal financial success,

despite the fact that as literary productions they are invariably defective. At the present writing the drama in this country is at the lowest possible ebb; a popular craze for burlesque, light comedy and vaudeville having occupied the almost undivided attention of manager, actor, and playwright.

Summary.—A survey of the great body of dramatic literature will lead to the conclusion that not merely the forms which literary work for dramatic representation can take, but even the situations and incidents which are suitable to such representation, are by no means very numerous, and tend to reproduce themselves in the practice of different times and different nations with considerable regularity. We also see that considerably less variety is obtainable in tragedy than in comedy, and that the former is infinitely the more difficult. The ages and circumstances in which drama has flourished most, have been those in which it occupied for a time and sometimes almost monopolized the position of public instructor and informer on questions of thought and news, as well as that of public entertainer. Another point worth noting is that the periods of best acting have by no means always coincided with the periods of best drama writing. Shakespeare's plays, in continuing to hold their own upon the stage, have trained great actors without producing great dramatists. See ACT; CHORUS; COMEDY; FARCE; MIRACLE PLAYS and MYSTERIES; SHAKESPEARE; STAGE, THE AMERICAN.

WILL M. CLEMENS,

Editorial Staff, 'Encyclopedia Americana.'

Dramatic Arts, American Academy of, a school of dramatic arts, chartered by the regents of the state of New York, in 1889. Its object is to train pupils for the stage. It offers a two years' course, including opportunities for public appearances. The school was established by Franklin Sargent (q.v.).

Drammen, drām'mēn, Norway, a seaport at the mouth of the Drammen River, on an arm of the Christiania Fjord, 25 miles southwest of Christiania. It is the second port in the kingdom for the export of timber. Pop. 20,441.

Dranesville, Battle of. Dranesville is on the Alexandria and Leesburg turnpike, 16 miles northeast of Washington; and 20 Dec. 1861, to collect a supply of forage near there, Gen. E. O. C. Ord, with his brigade of Pennsylvania

DRAPER

Reserves, the First Pennsylvania Rifles, a battery of four guns, and a detachment of cavalry—in all about 3,900 men,—moved from camp near Langley's. Driving a few Confederate cavalry from Dranesville, he entered it. It happened that the same morning Gen. J. E. B. Stuart started from the Confederate lines at Centreville with a brigade of infantry, 150 cavalry, 4 guns, and about 300 wagons, to gather hay near Dranesville; and he was so engaged when he heard that Ord was approaching. Fearing for the safety of his train, and believing that the only way to save it was to attack Ord, he advanced for that purpose, at the same time ordering his wagons back to Centreville. Stuart attacked with great impetuosity, and after a severe fight of two hours was defeated and retreated to Centreville, with a loss of 186 killed and wounded. Ord's loss was 67 killed and wounded. Compared with subsequent events, Dranesville was a small affair, but it gave encouragement to the Union cause and stands greatly to the credit of the Pennsylvania Reserves. Consult: 'Official Records,' Vol. V.

E. A. CARMAN.

Draper, Andrew Sloan, American lawyer and educator: b. Westford, N. Y., 21 June 1848. He attended the public schools of Albany until 1863, when he won a prize scholarship in the Albany Academy. Upon graduating in 1866 he became instructor there, and principal of a graded school, through the next four years. During these years he had been reading law, and, after graduating from the Albany Law School and the School of Law of Union University, he was admitted to the bar in 1871, and practised in Albany till 1887. In 1881 he was elected to the legislature, and for several years was actively engaged in politics. In 1884 he was appointed by President Arthur one of the judges of the United States Court of Alabama Claims, serving until the duties of that court were concluded.

It is, however, for his long and distinct service to the administration of American education that Dr. Draper is best known and appreciated. From 1878-81 and again from 1890-2 he was a member of the board of education in Albany; when in the legislature in 1881 he was a member of the committee on public education; in 1882 he became one of the board of the State Normal School in Albany; in 1886 and again in 1889 was elected, by the legislature, State superintendent of public instruction. From 1889-91 he was president of the National Association of School Superintendents; 1892-4 superintendent of public schools of Cleveland, Ohio; in the latter year resigned this position to become president of the University of Illinois, acting in that capacity for 10 years; in 1902 was appointed by President Roosevelt a member of the United States Board of Indian Commissioners; in 1903 was elected president of the North Central Association of Colleges and Secondary Schools; and on 9 March 1904 was chosen commissioner of education of the State of New York. He was chairman of the Department of Education of the International Congress at Saint Louis, 1904, and was awarded the grand prize of the exposition for the preparation of educational exhibits from Illinois and New York. Dr. Draper has written largely on historical and educational matters, and in 1905, be-

side contributing many articles himself to the work, became editor of the educational department of the 'Encyclopedia Americana' (see Vol. VI.). Among his numerous publications are: 'How to Improve the Country Schools' (1887); 'Powers and Obligations of Teachers' (1887); 'School Administration in Large Cities' (1888); 'The Indian Problem in the State of New York' (1888); 'History of the New York Common School System'; 'Legal Status of the Public Schools' (1890); 'The Authority of the State in Education' (1890); 'A Teaching Profession' (1890); 'American Schools and American Citizenship' (1891); 'The Spirit of the Teacher'; 'Science in the Elementary Schools'; 'The Pilgrims and Their Share in the National Life'; 'American Universities and the National Life'; 'The Illinois Life and the Presidency of Lincoln'; 'The Rescue of Cuba'; 'Bankers and the Community Life'; 'John Marshall and the March of the Constitution'; 'Memorial of President McKinley'; 'Coeducation in America'; 'The Personal Equation in the Medical Profession'; 'The Recovery of the Law'; 'The University's Return to the State'; 'The Element of Inspiration in the Schools'; 'Educational Tendencies, Desirable and Otherwise'; 'University Questions Concerning the Common Schools'; 'Organization and Administration of American Educational System'; etc.

Draper, Daniel, American meteorologist: b. New York 2 April 1841. He studied science under his father, J. W. Draper (q.v.), acting as his assistant and amanuensis for years. After 1869 he was director of the New York Meteorological Observatory, the self-recording instruments in use there being of his design. He has written a 'Treatise on the Causes of Pneumonia' and also helped his father in the preparation of his 'History of the Intellectual Development of Europe.'

Draper, Henry, American scientist: b. Prince Edward County, Va., 7 March 1837; d. New York 20 Nov. 1882. He is a son of J. W. Draper (q.v.). He was well known for his work in the line of celestial photography, and published 'A Text-book on Chemistry' (1866).

Draper, John Christopher, American physician: b. Prince Edward County, Va., 31 March 1835; d. New York 20 Dec. 1885. He was graduated from the medical department of New York University; was professor of physiology in that institution 1858-60, and professor of chemistry in the medical department 1866-85. He was also professor of chemistry at Cooper Union, and professor of physiology and natural history at the College of the City of New York. He edited the 'Year Book of Nature and Science' (1872-3) and for three years edited the natural science articles in 'Scribner's Monthly.' He wrote: 'Production of Urea' (1856); 'On Respiration' (1856); 'Text-book on Anatomy, Physiology, and Hygiene' (1866); 'Practical Laboratory Course in Medical Chemistry' (1882); 'Text-book of Medical Physics' (1885).

Draper, John William, American physiologist and chemist: b. Saint Helens, Lancashire, England, 5 May 1811; d. Hastings-on-the-Hudson, N. Y., 4 Jan. 1882. He obtained his early schooling at Woodhouse Grove, in a Wesleyan Methodist institution, and then took up courses in chemistry, physics, and higher mathematics

under a private tutor. In 1833, when 22 years of age, he came to the United States and entered the University of Pennsylvania, there taking a course in medical studies and graduating with his degree of M.D. in 1836. Shortly after graduating he received an appointment to the chair of chemistry, natural philosophy, and physiology in Hampden-Sidney College in Virginia, continuing in that capacity until 1839. It was then that he commenced the experimental researches which rendered his name famous, and during those years he contributed the results of his experiments to the 'American Journal of Medical Sciences.' In 1839 he was called to the chair of chemistry and natural history in the academic department of the University of New York, and also gave lectures on physiology to the more advanced undergraduates. In 1841 he became professor of chemistry in the University Medical College, and in 1850 professor of physiology. Draper made many improvements in the art of photography; following out the principles as invented by Daguerre in 1839, he commenced experimenting along the same lines and became the pioneer of photography in America, and it was he who first applied photography to the portrayal of the human face, his first photograph being that of his daughter, taken in 1839. He also discovered and described "misers' images," or roric figures, and about the same time applied the use of ruled glasses and specula to the study of chemical action of light.

Dr. Draper's writings were numerous, among the most important of them being: 'A Treatise on the Forces which Produce the Organizations of Plants' (1844), in which the author demonstrates that the most intense action of sunlight is produced by yellow rays; 'Text-book on Chemistry' (1846); 'Text-book on Natural Philosophy' (1847); 'Human Physiology, Statical and Dynamical, of the Conditions and Course of the Life of Man' (1856); 'History of the Intellectual Development of Europe' (1862), a work of great importance and very widely read, later being translated into 10 languages, the purpose of the book being to show that social advancement is as entirely dominated by natural law as is bodily growth; 'History of the American Civil War' (1867-70); 'History of the Conflict between Religion and Science' (1875); etc. His collected works were published in 1878, entitled 'Scientific Memoirs, Being Experimental Contributions to a Knowledge of Radiant Energy.'

Draper, Lyman Copeland, American antiquarian: b. Hamburg, N. Y., 4 Sept. 1815; d. Madison, Wis., 26 Aug. 1891. He removed to Wisconsin in 1853; became corresponding secretary of the State Historical Society, and it was mainly through his efforts that the State secured its library and its important antiquarian collection. He published: 'Collections' of the State Historical Society (10 vols. 1853-87); 'Madison the Capital of Wisconsin and its Heroes' (1857); 'King's Mountain and its Heroes' (1881).

Draper, William Franklin, American manufacturer: b. Lowell, Mass., 9 April 1842. He was educated in the public schools and at a private academy, served in the Federal army through the Civil War, becoming brigadier-general by brevet. He became a successful manufacturer of cotton machinery and made and

patented many improvements in it. He was a presidential elector in 1888; a Republican member of Congress 1892-7; and United States ambassador to Italy 1897-9. While in Congress he was a member of the Committee on Patents and the Committee on Foreign Affairs.

Draper, William Henry, Canadian jurist and legislator: b. near London, England, 11 March 1801; d. Yorkville, Toronto, 3 Nov. 1877. After obtaining his early education in England, in 1820 he went to Canada, where, after being admitted to the bar on 16 June 1828, he rapidly won promotion and distinction. His advance to high rank among Canadian jurists was accomplished mostly through the prominent part he played in the early governmental policies of Upper Canada. He was reporter to King's Bench, 1829-37; solicitor-general of Upper Canada, and a member of the executive council, 1837-41; the first attorney-general appointed in Upper Canada, 1841-7; a puisne judge of Queen's Bench, 1847-56; chief justice of the Court of Common Pleas, 1856-63; chief justice of Upper Canada, 1863-8; and president of the Court of Error and Appeal, Ontario, from 1868 till his death. He wrote: 'Upper Canada King's Bench Reports, 1729-1831' (2 vols. 1877). He will perhaps be best remembered for introducing in the legislature of Upper Canada legislation by the terms of which the Clergy Reserves were to be sold and the proceeds divided — the greater part going to the Church of England and the balance to the other Christian churches. This was carried by a small majority and afterward made law by imperial legislation. Consult: Hopkins, 'The Nineteenth Century: Progress of Canada,' Vol. IX. (Toronto 1900).

Drapery. See COSTUME.

Drapier Letters, a series of letters published by Dean Swift (q.v.), over the signature M. B. DRAPIER in 1724. They were called out by the proposal to impose upon Ireland a debased coinage, from which a court favorite and a king's ministers were to get the profit. The opposition to the action excited by these letters defeated the project and gave Swift a reputation he never lost. See also SWIFT, JONATHAN.

Draughts. See CHECKERS.

Drave, drāv'vė, or **Drau**, a European river which rises in Tyrol, flows east-southeast, part of its course between Hungary on the left and Croatia and Slavonia on the right, and after a course of 400 miles joins the Danube 14 miles east of Essek. It is navigable for 200 miles.

Dravidian, a term applied to the people who inhabited the southern part of what is now India previous to the advent of the Aryans, and also to the language spoken by these same people. The Dravidian languages are generally considered to belong to the Turanian class — a family of languages said by some authorities to include all the Asiatic languages in general, outside the European and Semitic families. The Dravidian languages include the Tamil, Telugu, Canarese, Malayalam, Tulu, Tuda, Gond, Rajmahal, and Oraon. There are other minor subdivisions made by some authorities. Only the first four mentioned have a literature. The Dravidians now occupy the greater part of the peninsula of India. The Tudas, or Todas, in the region of the Nilgiri Hills, belong to the lowest of civilized people or races, while among

the Tamils are found many who have attained a high place in literature.

The Dravidians proper are quite distinct from the Aryans, but they have been assimilating with those around them, so that now among them may be found traces of the Caucasians, and their literature partakes much of the Aryan culture; but they have kept their speech comparatively pure for centuries. In the southeastern part of the peninsula and in Ceylon live those who speak the Tamil; estimated to be about 16,500,000 people. North of the Tamils, and on the east, are the Telugus, about the same in number. The Canarese is spoken by about 10,000,000 people who live in the western part of the peninsula; and the Malayalam by about 4,230,000 people who live in the southwestern part of the peninsula.

In the Tamil and Telugu languages there are a number of excellent literary productions; not all original, some are modeled on or adapted from the Sanskrit. Two of the poems which may be traced to at least the 10th century — but which the Tamils claim are much older — are the 'Kintamani' and the 'Naladiyar.' The latter has been translated by Pope. The Tamils claim also that Agastya lived before Christ, and that he was the first teacher of science and literature. In about the 12th century, the poet Kambar made, in Tamil, an adaptation of the Sanskrit poem 'Ramayana,' one of the two great epics of India; and in the 16th century the poet Ati-Vira-Rama Pandya, a native king, wrote works of merit. The Tamil poet Tayumanavar wrote in the beginning of the 18th century; and at about the same time, an Italian missionary, a Jesuit named Beschi, wrote in the Tamil, both prose and poetry. The work of this literary priest has done much toward directing the attention of eastern scholars to the Tamil language and literature.

The oldest poem extant in Telugu language is a version of the Sanskrit poem, the 'Mahabharata,' the other of the two great epic poems of India. This poem was written in the Telugu by Nannaya Bhatta, in the 12th century. A poet named Cesava of the 12th century wrote in the Canarese. In the Malayalam there is one poem based upon the Sanskrit, an account of Rama, a heroic prince who belonged to a royal house of India. There are also versions of both the 'Mahabharata' and the 'Ramayana.' Consult: Dalton, 'Descriptive Ethnology of Bengal'; Kingscote, 'Folk-Lore of Southern India'; Caldwell, 'Comparative Grammar of Dravidian'; Oppert, 'Original Inhabitants of India'; Hunter, 'Dictionary of the Non-Aryan Languages'; Pope, 'First Lessons in Tamil'; Graul, 'Tiruvalluvar's Kural'; Hultzsch, 'South Indian Inscriptions, Tamil and Sanskrit'; Arden, 'Grammar of the Telugu Language'; Brown, 'Dictionary of Telugu'; Hopkins, 'Great Epic of India'; Fraser, 'Literary History of India'; Carr, 'Collection of Telugu Proverbs.'

Draw-loom. See DAMASK WEAVING.

Drawback, in common law, means an allowance or rebate made by the United States government to merchants on the re-exportation of certain imported goods, liable to duty. This drawback in some cases consists in the surrender of the whole duties collected on the goods; in other cases, only a part of the duties paid on the importation is returned to the importer.

Drawbridge, a bridge with a lifting or sliding floor, such as may be used for crossing the ditches of fortresses or may be constructed to cross navigable waters where the height of the roadway is insufficient to allow vessels to pass underneath. There are various kinds of drawbridges. One is the lifting bridge, which is raised bodily on one end. For fortifications this is the kind commonly employed, the platform forming or strengthening the gate when raised. For detailed history see *Movable Bridges* under **BRIDGE**.

Drawing is the art of representing upon a flat surface the forms of objects, and their positions and relations to each other. The idea of nearness or distance is given by the aid of perspective and foreshortening. Two ancient Greeks, Ardices and Telephanes, are said to have been the first who attempted to give the idea of roundness by a combination of lines called hatching. Philocles and Cleanthes were the inventors of monochromes, or drawings in one color, in which the lighter parts were produced by mixing the color with white. This formed the transition from drawing to painting. The Greeks were very strict and precise in their teaching of drawing. Pamphilus, the teacher of Apelles, desired that his pupils should remain 10 years with him receiving instruction. Linear drawing was brought in Greece to the highest degree of perfection. The contest between Apelles and Protogenes as to which of them could draw lines with the greatest delicacy and precision is well known.

The term drawing, in its strict sense, is only applicable to the representing of the forms of objects in outline, with the shading necessary to develop roundness or modeling. Pictures in oil or water colors, though based on drawing, should be exclusively called paintings. This distinction is observed in what follows.

The various styles of drawing may be divided into three kinds: (1) pen drawings; (2) chalk drawings, which may include lead-pencil drawing; (3) drawings shaded with the brush or hair-pencil. Pen drawings are often confined to pure outlines; an appearance of relief or projection being given by thickening the lines on the shadow side. Finished pen drawings have all the shading produced by a combination of lines termed hatching. Small, fine-pointed brushes are now often used instead of the pen, more delicacy and variety of tone being obtained. Drawings shaded with the brush are outlined with the pen, the shading being laid on or washed in with the brush in tints of Indian ink, sepia, or bistre. This method is used chiefly for architectural drawings and historical sketches. Chalk drawings are most suited for beginners, as the errors can be easily corrected. Black, red, and white chalks are used. When the chalk is powdered and rubbed in with a stump, large masses and broad effects can be produced with much rapidity.

Drawings may be divided into five classes: sketches, finished drawings, studies, academic drawings, and cartoons. First sketches are the ideas put upon paper by an artist, with the intention of carrying them out with more completeness and detail in some more elaborate work. They are merely intended to fix and retain his first thoughts. Finished drawings are such as are carefully executed and made complete in all

DRAWING

their parts. By studies are generally understood separate parts of objects carefully drawn either from life or from figures in relief; for example, heads, hands, feet, arms; but sometimes the term is applied to drawings of entire figures. To this class also belong drawings of the skeleton and muscles, as well as of draperies, animals, trees, foregrounds or other parts of landscapes. Academic drawings are those made in art academies from a living model in lamplight, which brings out the shadows more than daylight. The position of the person who serves as a model is carefully arranged at the commencement of each sitting, and in that position he is required to maintain himself. In this way the learners practise themselves in the drawing of the figure in various attitudes. In studying drapery and dress, a lay figure, made of wood and with movable joints, is clothed in various styles, and drawings made from it. Cartoons are drawings made on stout paper of the size of the paintings to be executed from them. They are mostly employed for pictures of large size, and are regularly used by fresco painters. The design is pricked through or traced from the cartoon upon the surface that is to receive the finished picture. See CAR-TOON.

The first sketches of the great masters are especially prized, because in them we find expressed most clearly the first glow of their conceptions. It is therefore much more difficult to make a copy of a first sketch with such accuracy as to deceive, than it is to make such a copy of a finished picture, for in the former case so much depends upon the freedom and facility with which the idea is expressed. The great schools of painting differ from one another as much in their drawing as in their painting. In Italy the Roman school, through Raphael's fine sense for the beautiful and expressive in form, and through his study of the antique, became the true teacher of beautiful drawing. The Florentine school tried to surpass the Roman precisely in this particular, but it lost by exaggeration what it had gained by learning and a close study of anatomy. In the Lombard school a tender style of drawing is seen through harmonious coloring, but this is rather derived from nature and instinctive feeling than attained by a close obedience to scientific principles. In the Venetian school the drawing is often veiled in the richness of the coloring, and if in some of the Venetian masters the drawing is bold and powerful, it indicates no deeper sense, no elevation or dignity, and is only imposing by its fearlessness and luxuriant fulness. The Dutch school excels in a careful and minute style of naturalistic drawing, combined with great excellence in coloring. The French school in the time of Poussin was very correct in its drawing; at a later period its style betrayed a great amount of mannerism. David introduced again a purer taste in drawing and a close study of the antique, and these are qualities which distinguish his school (the so-called classical school) from the romantic school of a later period, and the eclectic school of the present day, whose drawing is characterized by less dignity and grace, but shows more individuality and character. The modern German masters have a different style, which has been formed by an independent study of nature, and of the great masters, modified by the idiosyncrasies of the German mind. The drawing of the British school is naturalistic rather

than academic. It has of late years much improved in accuracy and expressiveness. The American school is similar to that of France, the artist being given to mannerisms, as evidenced in the work of Gibson, Taylor, Meyer, and others.

The best mode of acquiring the art of drawing is to commence by the simplest geometrical lines, proceeding to geometrical figures, from the more simple to the more complex. The student should first practise drawing accurately—perpendicular, horizontal, oblique, curved, and waved lines; then he should draw squares, triangles, circles, and ovals. These forms are the best for early instruction, because from their simplicity any inaccuracy in their delineation is easily detected. When the learner has conquered the difficulty of drawing these forms with accuracy he should proceed to draw those of a more arbitrary kind, such as the scroll and cylinder; then pyramids, obelisks, or vases, cups, books, baskets, etc., by which he will gradually become possessed of a more correct vision, and be able to give a proper degree of grace to his curved lines.

Having acquired a sufficient facility in drawing and shading these simple forms, he ought next to proceed to drawing from copies outlines of antique busts and statues. Such subjects are well calculated to give correctness to the eye, as from their beauty and perfection any slight deviation from their just proportions instantly offends and is easily detected. On the other hand, when landscapes and flowers are used as copies, an error in drawing the irregular forms that occur in them is much less easily perceived, the student is apt to be too easily satisfied with his work, and to fall into negligent habits which cannot afterward be easily eradicated. All these drawings should be made on a large scale, and be executed in a bold, distinct, and what painters call a broad style. Thus all the separate features of the face should be drawn the full size of life; for next to drawing from bad examples, nothing is a greater hindrance to proficiency than the making of small and miniature drawings.

In beginning a drawing, first get the object or objects into proper position on the paper, next into proper size, and last into proper shape. By inverting this mode of procedure learners frequently render their work very irksome, and are mortified to find that when they have matured a portion of their drawing, the part is not truly in position, or not of the proper size. The learner's first care should be accuracy of outline; next a studious observation of the shading and shadows that give roundness and relief to objects, combined with an earnest aiming at perfect manipulation. These being mastered, boldness of touch and rapidity of execution will follow.

Chalk-drawings are generally executed on a colored paper, for the purpose of producing a middle tint, so that a drawing on gray or stone-colored paper will have three degrees or tones of color—two from the chalks and one from the paper. Charcoal is used to sketch in the outline, which is then matured and made correct with Italian or hard black chalk. The shadows are laid in freely and broadly with soft black French chalk, and then softened and blended together with a stump. Chalk has many advantages over black-lead pencil; more especially

DRAWING AND QUARTERING — DREAMS

it is suited for drawings of large size, and it is by practising on a large scale that freedom and accuracy of hand are mainly to be acquired.

Before attempting to make sketches of landscapes from nature, the student ought to be pretty well acquainted with the general rules of perspective. He may then sketch whatever pleases him, commencing with the foreground and nearest objects, and from them comparing the size and relative positions of the more distant; for instance, if a wall or building come into the foreground of the sketch, from it he may find the position of a more distant object, such as a church, by comparing horizontally what part of the wall the church is opposite, and so on, for the retiring distance.

Literature.—Cross, 'Color Study'; Hamerton, 'Drawing and Engraving'; Hutchinson, 'Some Hints on Learning to Draw' (1893); Leland, 'Drawing and Designing'; Maginnis, 'Pen Drawing' (1900); Ruskin, 'Elements of Drawing'; Spiers, 'Architectural Drawing'; Veollet, 'Learning to Draw'; Walker, 'Hand-book of Drawing'; White, 'Drawing for Reproduction'; Wilson, 'Free-hand Perspective.'

Drawing and Quartering, the punishment of treason in Great Britain in force till 1870. The law provided that the offender be drawn to the place of execution on a hurdle; that he be hanged by the neck and disemboweled; that his head be severed from his body, and that body be divided into four parts, or quartered.

Drawing-board, a board on which paper is strained for water-color painting. It is made of a flat piece of wood held together and prevented from warping by an edging of other pieces, the grain of which runs in an opposite direction. The drawing-paper is first damped and then attached to the edges of the board with thin glue, gum, or paste, and when dry becomes perfectly tight and flat.

Drayton, Michael, English poet: b. Harts-hill, Warwickshire, 1563; d. London 1631. His first appearance as an author was in 1591, by the publication of 'Harmony of the Church, Containing the Spiritual Songs and Holy Hymns of Godly Men, etc.' followed in 1593 by 'Idea, the Shepherd's Garland,' and 'Roland's Sacrifice to the Nine Muses,' a series of eclogues. In the same year appeared his 'Legend of Piers Gaveston,' and in 1594 his 'Matilda.' Drayton's great poem is his 'Polyolbion' (1613), a sort of topographical description of England. It is generally extremely accurate in its details, with, at the same time, many passages of true poetic fire and beauty. It is frequently, however, tedious and obscure, and its extreme length is sufficient to deter many from undertaking its perusal. The gem of Drayton's poems is his 'Nymphidia, the Court of Fairy,' edited by Sir E. Brydges in 1814. His other works comprise several historical poems, such as the 'Barons' Wars' (1603, first issued in 1596 under the title 'Mortimeriados'); 'England's Heroical Epistles' (1597); the 'Legend of Great Cromwell' (1607); the 'Battle of Agincourt' (1627); besides numerous legends, sonnets, and other pieces. He was buried in Westminster Abbey, where there is a monument to his memory.

Drayton, Thomas Fenwick, American military officer: b. South Carolina about 1807; d. Florence, S. C., 18 Feb. 1891. He was graduated at the United States Military Academy

in 1828, and resigned from the army in 1836. He entered the Confederate army upon the outbreak of the Civil War, and played a prominent part during the attack on Fort Royal, commanding a force in Fort Walker which he was forced to evacuate.

Drayton, William, LL.D., American judge: b. South Carolina 1733; d. June 1790. He was educated for the bar in the Middle Temple, London, where he studied four years. He returned to America in 1754, and was appointed chief justice in the province of East Florida in 1768. During the War of the Revolution he was suspended from his office and reinstated in it, and went with his family for a time to England. After the Peace he became successively judge of the admiralty court of South Carolina, associate justice of the State, and a judge under the Federal government.

Drayton, William, American politician: b. South Carolina; d. Philadelphia 24 May 1846. He was a representative in Congress from South Carolina from 1825-33, and in 1830 was a leader of the Union party in opposition to that of nullification. He resided in Philadelphia many years prior to his death, and in 1839 succeeded Nicholas Biddle as president of the United States bank, the affairs of which he found it impossible to retrieve.

Drayton, William Henry, American statesman: b. Drayton Hall, S. C., September 1742; d. Philadelphia 3 Sept. 1779. He was educated in England at Westminster School, and at Balliol College, Oxford. Returning to America in 1764, he became an active writer on political affairs, and published letters on the side of the government, which brought him into controversy with Christopher Gadsden and other patriotic leaders. As the Revolutionary crisis approached he espoused the popular cause. In 1774 he was appointed judge of the province, and when the Continental Congress was about to sit he published a pamphlet under the signature of "A Freeman," which substantially marked out the line of conduct pursued by the Congress. In 1775 he was president of the Provincial Congress, and in 1776 was elected chief justice of South Carolina. He was a member of the Continental Congress from 1778 till his death. His 'History of the Revolution' appeared in 1821.

Dreams, subjective phenomena dependent on natural causes, or trains of ideas which present themselves to the mind during sleep. The principal feature of the state of dreaming is the absence of voluntary control over the current of thought, so that the principle of suggestion has unlimited sway. The utter want of coherency in the images that appear before the mental eye excites no surprise in the dreamer. All reflex acts are lowered; breathing and the action of the heart become slower, and the other organic functions are diminished. These phenomena are due to the exhaustion of the energy of the brain, and to the changes necessary for its restoration, and for the removal of tissue waste. They are accompanied by a diminution of the amount of blood flowing through the brain. As we go to sleep our senses drop off one by one; we cease to see or smell, while we still continue to hear. A light sleeper may, without waking, answer questions put to him, and we may sometimes go so far as to deliver an oration or pen a treatise, which, in our wak-

DREAMS

ing remembrance, may often seem much more clearly and vigorously thought out than if we had composed them by the efforts of the will during waking hours.

Cabanis, in his 'Rapports du Physique et du Moral de l'Homme,' says of Condillac, that he often brought to a conclusion in his dreams reasonings on which he had been employed during the day, and which he had not completed when he went to bed; and of Franklin, that that wise and enlightened man believed that he had been often instructed in his dreams concerning the issue of events which at that time occupied his mind.

Coleridge thus describes the circumstances under which the fragment called Kubla Khan was composed: He had fallen asleep in his chair while reading in Purchas' 'Pilgrimage' of a palace built by Khan Kubla, and remained in that state for about three hours; during which he could not have composed less than from 200 to 300 lines, if that can be called composition in which all the images rose up before him as things, with a parallel production of the correspondent expressions, without any sensation or consciousness of effort. On awaking he instantly sat down to commit the poem to paper. After he had written the lines subsequently published, he was interrupted for a time, and when he returned to the task the poem had vanished from his memory. The cause of this coherency no doubt is, that when we are awake the attention is more liable to be withdrawn from the train of ideas by external objects.

Generally, however, dreams are wanting in coherency; all probabilities and possibilities of time, place, and circumstance are violated. Nothing is more common than for the mind in dreams to combine objects and events which could have had no associated existence. The faces of friends long since dead, and events long since past rise before us sometimes with more intense vividness than in real existence and cause no surprise by their incongruity, because the mind views them without the association of ideas which, in a waking state, would place them at such a distance from the present time that no cognizance could be taken of them except as very remote events. It is the belief we for the time possess that these trains of ideas are sensations that removes all sense of surprise and incongruity; we have not, together with these apparent sensations, the ideas of the death or the period elapsed, and we are not surprised at seeing, or believing that we see, the persons or events, any more than we would be surprised at seeing, if that were possible, the same persons or events when we are awake, if we did not know that the person had died or that the event was historical. This explanation is confirmed by those instances in which we do feel surprise. The idea of a person or event believed to be seen may call up any of the additional ideas that have before been absent. We fancy we see a person, and then we think of his death; we are immediately surprised, and we have an inner dream that we are dreaming.

Sensations of physical pain, including those of heat and cold, and sensations in the alimentary canal, have an important influence on dreams. Dr. Gregory relates, that having occasion to apply a bottle of hot water to his feet on retiring to bed, he dreamed of making the ascent of Mount Etna and found the heat intolerable. Dr.

Reid having had a blister applied to his head dreamed of being scalped by Indians. One notable peculiarity is that when the physical sensation influences the dream, the intensity of it, pleasurable or painful, is considerably increased. Thus if the ear be disturbed by the sounds of a flute, a thousand beautiful and pleasing associations may be invoked; the air is filled with the sounds of harps, or the combined intricate harmonies of a concerted and accompanied piece, and we may call up images of the performers themselves.

The rapidity with which we dream is also remarkable. We may seem to live a weary lifetime in the dream of a minute; the sprinkling of a few drops of water on a gentleman's face produced a dream in which the events of a whole life passed before him, ending with a protracted struggle on the borders of a lake into which he was plunged. The whole process must have taken place in a second or two, as the dreamer was aroused from sleep by the application of the water. Some authorities declare that all our dreams take place when we are in process of going to sleep or become awake, and that during deep sleep the mind is totally inactive. This is denied by the majority of philosophers, and with apparent reason.

Some maintain that no sleep is ever so profound as to be perfectly dreamless. Sir William Hamilton thought that we dream always, but simply forget our dreams. This proposition, which obviously cannot be proved, is supported by the fact that we forget with the utmost readiness what we know we have dreamed, and that others may see in our actions evidence of dreaming of which we ourselves afterward retain no recollection. Many facts, however, in connection with injuries to the head point in an opposite direction. Maudsley quotes the case of a boy who was rendered insensible by the kick of a horse. After trephining the depressed bone he became sensible. The surgeon took advantage of the hole in the skull to make firm pressure on the exposed brain after asking him a question. While the pressure lasted he remained silent, but the instant it was removed he made a reply, never suspecting that he had not answered at once. With an over-congested brain, there is a tendency to a rapid succession of vivid dreaming, interrupted by intervals of wakefulness. The brain cells are too excited by the excess of blood to pass into a condition of repose, and their activity tends to keep up the congestion of the organ. When the blood is deficient in quantity or quality, or poisoned by substances which ought to be removed from the body, or when the nervous system is exhausted by such causes as over-fatigue, shock, or depressing emotions from over-indulgence in any form, then unpleasant dreams are apt to follow. The onset of acute disease (especially when affecting the nervous system) is not infrequently heralded by continued dreaming or continued sleeplessness. Depressing dreams should always be regarded as an indication of need for attention to health, or to relaxation from work, more especially, perhaps, by those engaged in professional pursuits.

The special character of many dreams is determined by the condition of the organs of the thorax and abdomen, and of the muscular system. For example, the presence of indigestible food in the stomach, by embarrassing the breathing and the action of the heart, suggests the

ideas of the various forms of nightmare, the monster, or the crushing weight, from which there is no escape, which are closely akin to the sensations induced by similar effects on the heart during the day. An uncomfortable position in bed, a strained condition of the muscular system, will cause dreams of falling over precipices or of struggling. Certain drugs give a specific character to dreams. The magnificent visions of the opium stupor have been made familiar by the classical account of De Quincey. It is well to mention that the splendor of the dreams is not so certain to follow the indulgence of the opium habit as is the degradation of our mental and moral and physical nature. The furious homicidal delirium caused by *hasheesh* (Indian hemp) is indicated by its being the origin of the term "assassination." Excessive indulgence in alcohol gives rise to delirious dreams characterized by unfounded dread and suspicion. Workers in india-rubber factories, who are exposed to the inhalation of bisulphide of carbon, suffer from fearful dreams of being murdered and falling over precipices. Many other drugs induce almost as certain results. Occasionally intellectual efforts are made during sleep which it would be difficult to surpass in the waking state.

It is an interesting question how the deaf and the blind dream. Dr. Darwin records the case of a gentleman who had been deaf for 30 years, and who never dreamt of persons conversing with him except by the fingers or in writing, and never had the impression of hearing them speak. Mr. Johns, in the 'National Review' (1885), states that the blind, who can of course have no visual images, dream as actively as those that see, and dream by hearing, touching, and smelling; they tell the size of a room by the sounds of imaginary persons walking in it, recognize a friend by his voice, or by touching him, or the freshness of the morning by the smell of the air. In some forms, which may be named somnambulant dreams, in which the dream is acted as well as thought out, it is remarkable that almost no recollection is retained. The night terrors of nervous children, so frequent during their second dentition, often cause unnecessary anxiety. Dr. Clouston of Edinburgh refers to a case where a confirmed somnambulist during his sleep seized his child, to whom he was devotedly attached, and caused his death by dashing him against the wall, under the belief that he saw a wild animal in the room. The man was acquitted of the charge of murder, it being held that he was not responsible during sleep. The condition might be described as one of sanity during the waking hours, and of the opposite during sleep. Such cases are generally indications of a strong hereditary tendency to instability of the nervous system.

Among the peoples of antiquity, dreams were regarded as direct messages from the spiritual world, of either divine or diabolical origin; their interpretation was elevated to the rank of a science. At the royal courts of Babylon and Egypt the interpretation of dreams was part of the duties of soothsayers. Now the tendency is to explain away on the ground of mere coincidence the undoubted facts of foretelling the future. Some regard the apparent foretelling of the future as on a par with the working out of a problem by a mathematician. It is the solution during sleep of the question that has been oc-

cupying the mind of the deep (moral or religious) thinker.

Pseudo-psychologists believed that dreams are caused by the flight of the soul to other regions, and that on its return to the body it remembered what it had actually seen. Some persons have thought dreams the proof of the soul's immortality. This hypothesis formed the basis of the religion of Comenius and of Emanuel Swedenborg. Swedenborg strengthened the Church which he founded by his claim to have visited Paradise and his report of his experiences there. The North American Indians regarded dreams as prophetic and often took them as solemn injunctions. Among more enlightened people there may be an inducement to action from the impression of a dream; here, also, the consequence is the fulfilment of the prophecy. Such were the dreams of Judas Maccabæus, of Sylla, of Germanicus, and the dream of the priestess of Proserpine on the eve of Timoleon's expedition from Corinth to Syracuse, that Ceres volunteered to be his traveling companion into Sicily. The dream of Olympia, that she was with child of a dragon, might both have suggested the mode of education and incited the warlike spirit of Alexander. It is said that the city of Carthage was rebuilt by Augustus Cæsar in consequence of the dream of his uncle Julius. Of such a nature, too, were the dreams of the Emperor Julian and of Calphurnia; and such was the dream of Cromwell that he should be the greatest man in England. In all these, and a thousand more, the mere constant thinking excited the dream. The ambitious thought of Cromwell was constantly haunting his waking moments, pointing to personal aggrandizement, and, of consequence, imparted a like character to his slumbers.

J. ACKERMAN COLES, M.D.

Drebbel, Cornelis van, Dutch philosopher and inventor: b. Alkmaar, North Holland, 1572; d. London 1634. He lived in London from the year 1620, devoted entirely to scientific labors. He invented several philosophical instruments, among which, it is said, were the compound microscope and a thermometer consisting of a glass tube containing water connected with a bulb containing air. His contemporaries say that he displayed to King James a glass globe in which by means of the four elements he had produced perpetual motion, and that by means of machinery he imitated rain, thunder, lightning, and cold, and was able quickly to exhaust a river or lake. He discovered a bright scarlet dye for woolens and silks, which was introduced into France by the founders of the Gobelin manufactures; and the invention of the telescope has been ascribed to him, but on no good grounds. Drebbel left treatises which appeared first in Dutch (1608), and afterward in Latin, under the title 'Tractatus duo: De Natura Elementorum; De Quinta Essentia' (1621).

Dreber, Heinrich, known as **Franz-Dreber**, German painter: b. Dresden 9 Jan. 1822; d. Anticoli di Campagna, near Rome, 3 Aug. 1875. He began his art education at the Dresden Acad-

DRED — DRED SCOTT CASE

emy, and became a pupil of Ludwig Richter, whose idealistic style he copied. He went to Rome in 1843 at the expense of the Dresden Academy. Two of his pictures are in the Berlin National Gallery, namely 'An Autumn Morning in the Sabine Mountains'; and 'The Hunt of Diana.' A landscape, with the figure of the 'Good Samaritan' is to be found in the Dresden gallery.

Dred, A Tale of the Great Dismal Swamp, a novel by Harriet Beecher Stowe, published in 1856. It belongs to the literature of the slavery agitation in the United States, and deals with the experiences of a fugitive slave. It is also called 'Nina Gordon.'

Dred Scott Case, the most far-reaching slavery case ever in the United States courts. Dred, born in Missouri about 1810, was a slave of Dr. Emerson, an army surgeon, who took him in 1834 to Rock Island, Ill., and May 1836 to Fort Snelling, Wisconsin Territory (now Minnesota), where he married Harriet, a slave of his master, and had two children. Slavery was illegal in both places: in Illinois by its Constitution, in Wisconsin (upper Louisiana Purchase) by the Missouri Compromise. In 1838 he was taken back to Missouri — Saint Louis.

Here in 1848 was living the eminent free-soil lawyer, Francis P. Blair, jr. He learned of Dred's migrations, and wishing to test the right of slavery to reclaim persons once free, induced Dred on being whipped by his master to sue for assault and battery in the State circuit court of Saint Louis County. Blair and his free-soil friends furnished funds and legal assistance. The suit was sustainable only if Dred was a free citizen charging violence from another citizen; and the court held that his residence on free soil had made him free, and there was no legal power to re-enslave him. Appeal was taken to the supreme court of Missouri, which reversed the decision, the two associate justices against the chief justice, decided that Emerson had only made a temporary change of domicile in obedience to government orders, that his property was held according to the laws of his permanent domicile, and that Scott's servile character was merely in abeyance and fully resumed on return to Missouri; refused to consider the Illinois Constitution or the Missouri Compromise as relevant, and sent back the case to the circuit court.

Meantime Emerson had sold Dred and his family to John F. A. Sandford of New York and suit was brought against Sandford for assault and battery in carrying off Scott — this time in the Federal circuit court for Missouri, on the constitutional ground that he was a citizen of a different State from Sandford. Sandford denied jurisdiction on the ground that Dred was not a citizen but "a negro of African descent," progeny of negro slaves. Dred's counsel demurred (admitted the facts but denied their sufficiency), claiming that being a negro did not prevent his being a citizen; the court sustained him. Sandford denied assault and battery, claiming that he had only "gently laid hands" on him to coerce him, as was his right toward a slave; the court instructed the jury that this was law; Dred's counsel took exception, and the case went up to the United States Supreme Court.

It was argued at the December terms of 1855

and 1856. Montgomery Blair (brother of Francis P.) and George Ticknor Curtis (brother of Judge Curtis) were counsel for Scott, Reverdy Johnson, and Henry S. Geyer for Sandford; all gratuitously. Justice Nelson prepared a brief abstract of the decision; but the public excitement over the slavery question was so intense and menacing to the Union (just after the Buchanan-Fremont election), that it was decided to have Chief Justice Taney write a full and careful review of the whole law on the subject of slavery, in hope of making the members of the free-soil party accept it contentedly and cease their agitation. Taney and six assistant judges concurred against Scott; Curtis and McLean dissented.

The written decisions were withheld from the public till 6 March 1857, two days after the inauguration, to avoid embroiling Pierce's last months. The decision proper was essentially the same as that of the supreme court of Missouri; that Dred Scott as a negro was not a citizen of the United States within the intent of the Constitution, and therefore the circuit court had no jurisdiction and the suit should be dismissed. This decision remained United States law, an irremovable barrier in the way of granting civil rights to the colored race, till the passage of the Fourteenth Amendment (see CONSTITUTION, Amendments).

Unfortunately, the court did not confine itself to the case before it; but for the reasons above mentioned, and to answer for the public the arguments brought forward by counsel, who went out of their way to deliver a series of *obiter dicta* (personal judgments not needed or relevant for the case in hand, and therefore not law), which inflamed the public wrath immeasurably as a fresh aggression of the slave power, have remained in public memory as the only interesting points in the case, and are, in fact, by far the most important aspects of it. These were three: in essence, that African negroes had never been recognized in American law or custom as persons; that Congress had no power to make regulations for the Territories acquired after the Constitution was adopted, except under the Constitution, which recognized slaves as property; and that the Missouri Compromise, already repealed by the Kansas-Nebraska Bill, had never been constitutional. (1) Of course no exception had been taken by Scott's counsel to the circuit court's ruling that negro blood was no bar to citizenship; but the Supreme Court dragged it in and overruled it. In the counsel's statement of the condition of public opinion at the time of framing the Constitution, they used a phrase which is immortal in public memory, and usually supposed to be their own decision as a point of present law: that negroes were then regarded as "so far inferior that they had no rights which the white man was bound to respect," and to be rightfully made slaves for white men's benefit. The Court held that they were regarded in the Constitution as only chattel property; were not included in the words "people" or "citizens" in the Declaration of Independence, the Articles of Confederation, or the Constitution, remained in this condition of civil nullity even when emancipated, had no rights except such as each State chose to grant them, and could not become citizens capable of suing or being sued. The dissenting judges pressed

DREDGE — DREINCOURT

the notorious distinction between citizenship and suffrage (see CITIZEN); called attention to the Constitution's repeated mention of the negroes as "persons," and to the fact that free negroes were actually voters in five of the States in 1787, and were so even yet save where the States had changed their constitutions to disfranchise them; and held that the civil rights of free negroes were the same at least as those of women and minors. (2) As to the Territories, the *obiter* decision was that as the Constitution admitted slaves to be property, and by the Fifth Amendment, Congress had no right to take away any citizen's property without compensation, it had no right to make laws barring slave property from the Territories more than any other: that its rules and regulations must be in conformity with the Constitution. The dissenting judges held that both by common law and the Constitution slavery was a purely State institution (cf. Art. IV., § ii., par. 3: "No person held to service or labor in one State," etc.), sustainable only by State law and State police power of quelling resistance; that once out of the State's power, a slave instantly became free by the law of nature, and that State law could not follow him to the Territories. (3) The decision that the Missouri Compromise was unconstitutional, as interfering with the natural right of a slaveholder to take his property where he pleased, and with the constitutional equality of citizens of different States, followed from the Court's opinion on the second point. The dissenting justices held that the Compromise was a rightful exercise of the constitutional power of Congress to legislate for the Territories, and never before questioned since the government was founded; and that it did not violate the equality of citizens because citizens could only hold slave property in States that permitted and enforced it.

The whole question was soon decided by the War. Scott and his family were inherited by Calvin S. Chaffee of Massachusetts (then in Congress), were conveyed by him to Taylor Blow of St. Louis for emancipation, and were emancipated 26 May 1857. See Decision in Howard's 'Report . . . in the Case of Dred Scott' (1857); Benton, 'Examination of . . . the Dred Scott Case' (1860); Tyler, 'Life of Taney' (1872); Curtis, 'Life of B. R. Curtis' (1880). The Missouri Historical Society has a portrait of Scott, from a photograph.

Dredge (from Ger. *tragen*), a mechanical device for the removal of soil and other solids from under water. See DREDGING; DEEP-SEA LIFE.

Dredging, the operation of removing mud, silt and other deposits from the bottom of harbors, canals, rivers, docks, etc., by mechanical means. The most simple dredging apparatus is the spoon apparatus, which consists of a strong iron ring or hoop, properly formed for making an impression upon the soft matter at the bottom, so as to scoop it into a large leather bag attached to the ring and perforated with a number of small holes. The means for working it is a long handle, a suspending rope, and a crane or sweep-pole planted in a boat. This primitive apparatus was formerly used in the canals and ditches of the Netherlands. Much more effective is the steam dredging-machine now in common use. It is said to have been first applied by Boulton and Watt for use on

the Weir at Sunderland, England, in 1796. It has a succession of strong iron buckets on an endless chain running on a frame, the lower end of which is vertically adjustable so as to regulate the depth at which it works. The buckets tear up the matter at the bottom, raise it, and discharge it into barges or hoppers stationed close to the dredging vessel. The Suez Canal was excavated by means of a ladder dredge with a long chute and supporting girder. The material excavated was carried in boxes on a sort of tramway and tipped out on the bank.

In excavating at Hell Gate and Flood Rock Reefs, at New York, a barge measuring 120 feet in length, 44 in beam, and 15 in depth, used a grapple which weighed 15 tons and lifted boulders of 70 tons. In some cases the current of river or tides has been utilized in dredging channels. In bottoms of mud or loose sand the steam pump or hydraulic dredger may be used. The watery material is pumped out and deposited on the shore; the water drains away, leaving the sand or mud. By this means more than 3,000 cubic yards a day can be excavated at an extremely low cost. Great improvements have been made in hydraulic dredges, and some built in recent years for use in the Mississippi River have a capacity of over 1,000 cubic yards per hour.

Dredging is also the operation of dragging the bottom of the sea in order to bring up oysters, or to procure shells, plants, and other objects for scientific observation. The oyster dredge is a light iron frame with a scraper like a narrow hoe on one side, and a suspending apparatus on the other. To the frame is attached a bag made of some kind of netting to receive the oysters. The dredges used by naturalists are mostly modifications of or somewhat similar to the oyster dredge. Scientific dredging has of late assumed a high importance as making us acquainted with the life of deep-sea areas. See DEEP-SEA LIFE.

WILLIAM H. HEUER,
Corps of Engineering, U. S. Army.

Dreibund. See TRIPLE ALLIANCE, THE.

Dreiser, Theodore, American journalist: b. Terre Haute, Ind., 27 Aug. 1871. He was educated at the State University of Indiana. From 1891 to 1895 he was in newspaper work in Chicago, St. Louis, and Pittsburgh. He edited 'Every Month,' a musical periodical, 1895-7, and then engaged in special work for the 'Cosmopolitan Magazine.' He has written: 'Sister Carrie'; 'Studies of Contemporary Celebrities'; 'Poems.'

Dreissena, drīs'sē-nā, a genus of fresh-water lamellibranch mussels of the *Dreissenidae* family, so named from Dreyssen, a Belgian naturalist. *D. polymorpha*, a native of the Caspian and Aral rivers and seas, is a well-known species in the rivers and estuaries throughout western Europe, including Great Britain, where they were accidentally introduced, probably on imported timber.

Dreincourt, Charles, shārl drē lān koor, French Calvinistic clergyman: b. Sedan 10 July 1595; d. Paris 3 Nov. 1669. He was the author of many controversial works, and of a book entitled 'Les Consolations de l'Ame Fidèle contre les Frayeurs de la Mort,' translated into English under the title, 'The Christian's Defense Against the Fear of Death' (1675). To promote the sale

DRENTHE — DRESDEN

of the English translation of this work, De Foe, it is said, wrote his 'Apparition of Mrs. Veal,' which was published along with the fourth edition of it in 1706. His son CHARLES (1633-9) became professor of medicine and anatomy at Leyden, and was appointed physician to William, Prince of Orange, afterward William III. of England.

Drenthe, drĕn'tĕ, a province of Holland, the principal wealth of which is obtained from breeding horses and rearing superior cattle, sheep, swine, and poultry of all kinds. Its capital is Assen. Pop. 148,542.

Dresden, Germany, capital of Saxony, situated in a valley on the river Elbe. On the left bank are the Altstadt (Old Town), Friedrichstadt, and other quarters, and on the right the Neustadt (New Town), and the Antonstadt. The municipal area received a large extension in 1897. The portion on the right bank called the Neustadt since 1732 is really the older, and was formerly known as Old Dresden. Among the structures worthy of notice are the five bridges across the Elbe, noted for their solidity, the first built in 1173; the Sophienkirche or Protestant Court Church; the Roman Catholic Court Church, which contains several fine pictures; the Church of Our Lady, an imposing edifice; the Church of St. John; the royal palace; the law courts; the Museum, a beautiful building, containing a famous picture gallery and other treasures, and forming a wing of the building known as the Zwinger, which contains zoological and other collections; the Japanese Palace (Augusteum), containing the public library of from 300,000 to 400,000 volumes, besides a rich collection of antiquities; the Johanneum, now containing the collection of porcelain and the historical museum, a valuable collection of arms, armor, domestic utensils, etc., belonging to the Middle Ages. The royal palace is unattractive externally, but has a fine interior adorned with frescoes, and the Green Vault contains a most valuable collection of jewels and small works of art. The court theatre forms a large and splendid edifice designed by Gottfried Semper, begun in 1871, and opened on 2 Feb. 1878. There is a fine park of 300 acres. The city is distinguished for its excellent educational, literary, and artistic institutions, among which are the Polytechnic School, organized much on the plan and scale of a university; several gymnasia and schools of the first rank; a military academy; the Conservatory and School of Music; the Academy of Fine Arts; the Royal School, for drawing, modeling, etc. The manufactures of Dresden are not unimportant, and are various in character; the china, however, for which the city is famed, is made chiefly at Meissen, 14 miles distant. In Dresden are made articles in gold and silver, mathematical and surgical instruments, straw hats and plait, artificial flowers, gloves, leather, cigars and cigarettes, musical instruments, chemicals, perfumes, mineral waters, chocolate, playing-cards, etc. There are large breweries, and in the neighborhood there are coal mines, iron and glass works, and manufactories of chemical stuffs, etc. The commerce is considerable, and of late years, since the development of the railway system, the trade with foreign parts has considerably increased. A good deal of business is done with the upper

parts of the Elbe, by means of the steamers, which ply as far up as Tetschen.

The gallery of pictures, one of the finest in the world, was begun very early, but first became of much importance under Augustus II., king of Poland and elector of Saxony. It owes its most valuable treasures, however, to Augustus III., a prodigal monarch, who exhausted his country by his extravagances. He purchased the greater portion of the gallery of the Duke of Modena for \$900,000, and many single pictures, among them Raphael's masterpiece, the 'Madonna di Sisto.' This celebrated painting is in a room alone, no other picture being hung near it. The pictures number about 25,000, and in particular comprise many fine specimens of the Italian, Dutch, and Flemish schools. From the Dutch school there are, among others, some 40 Rubenses, 20 Van Dycks, over 20 Rembrandts, besides Ostades, Gerard Dows, Teniers, Wouwermans, etc. Of the old German school Holbein's 'Madonna,' a sublime work, is particularly distinguished. Of the French school there are many Claude Lorraines, Poussins, Le Bruns, and others. Of the Italian school the gallery is rich in pictures of Correggio, including his famous 'La Notte,' or 'Holy Night'; of Raphael, the 'Madonna di Sisto,' the 'Madonna della Seggiola,' and others. There are also works of Leonardo da Vinci, Giulio Romano, Andrea del Sarto, Battoni, Titian, his famous 'Venus' and 'The Tribute Money,' Garofalo, Paolo Veronese, Guido Reni, Carracci, Carlo Dolce, and every distinguished Italian painter. Many modern painters are represented in this gallery, among them Hofmann, and several specimens from the Düsseldorf school. Murillo and Velasquez are remembered by one picture each. This collection is liberally open every day to all visitors. Besides this fine gallery of pictures the Museum contains also a collection of engravings and drawings, in all amounting to upward of 350,000. There is here also a rich collection of casts exemplifying the progress of sculpture from the earliest times, and including copies of all the most important antiques, made under the direction of Raphael Mengs, in Italy. The collection of antiques in the Japanese Palace contains some excellent statues, among which are distinguished three female figures from Herculaneum. The Johanneum Museum contains a historical museum and a large variety of specimens of Chinese, Japanese, East Indian, Sèvres, Meissen, etc., porcelain ware arranged chronologically. Dresden being thus rich in treasures of art, and favored by a beautiful natural situation, is the summer resort of many foreigners.

Dresden is of Slavonic origin, and first came under German and Christian influence after the subjugation of the Slavs about the year 922. At the beginning of the 13th century it is mentioned in documents as a city, and as a residence of the margraves of Meissen. Since 1485 it has been the residence of the rulers of Saxony. In the first half of the 18th century it was greatly embellished, but suffered much in the Seven Years' war. In 1760 for nine days it was bombarded by Frederick the Great. The Austrians occupied the city in 1809 without injuring it. The campaign of 1813 was most ruinous for the city and its environs. From May till about the middle of September it was held by Napoleon, and severe fighting in and around the city took place almost every day. After some years

of war and suffering, on 7 June 1815, peace and industry returned to the "German Florence," as Herder calls Dresden. After that time dwelling houses, gardens, and parks took the place of the former fortifications. During the revolutionary movement of 1849 it suffered severely. In 1866 it was occupied by the Prussians, but was evacuated in the following spring. It has been greatly beautified and extended in recent times (especially under the auspices of King John), and its population is rapidly increasing. Pop. (1900) 395,349.

Dresden, Battle of, a battle fought in 1813, when an allied army of 150,000 Russians, Austrians, and Prussians, commanded by Prince Schwarzenberg, sought to regain possession of Dresden, which was occupied by 20,000 French troops under Saint-Cyr. The Allies appeared before Dresden on 25 August, but Schwarzenberg did not attack until the following morning, when each division drove back the French and gained advantageous positions in the city, so that it appeared as if Saint-Cyr would be forced to capitulate. In expectation of reinforcements and satisfied with the morning's achievements, Schwarzenberg at noon called a halt. The delays proved fatal. Napoleon, who had gone to the support of Ney, against Blücher in Silesia, on learning of the Allies' march on Dresden, had hastened back, and during Schwarzenberg's unfortunate halt, French reinforcements were flocking across the Elbe, so that at 4 o'clock in the afternoon, when the Allies resumed the attack, there were 100,000 troops, who easily opposed all their efforts and drove them from their hard-won positions. Darkness stopped the conflict, which Napoleon resumed early the next morning, the fight continuing throughout the day until a strategic cavalry charge under Murat in the rear of the Austrians broke their line of resistance and practically ended the battle, the Allies beginning their retreat into Bohemia at 4 in the afternoon. The French took over 20,000 prisoners, while the killed and wounded on either side were estimated at between 7,000 and 8,000.

Dresden China, a delicate, semi-transparent, highly finished china made at Meissen, near Dresden. The manufacture resulted from an accidental discovery made by Böttger, a young chemist, in 1710, and the vases, statuettes, groups of figures, candelabra, clocks, etc., manufactured during the 18th century are highly prized. They are more remarkable for excellence of execution than for purity of design.

Dress, the clothing or apparel of the human body. Under this title may be considered the subject of the principles underlying the wearing of clothes rather than the minute details of their shape and color, which will be found under the title **COSTUME**. The evolution of dress has always been associated with the growth and decline of nations, and throws much light on racial characteristics. In the earliest stage of human history dress must, of course, have been strictly utilitarian, consisting only of the covering necessary to protect the body against the extreme conditions of climate and temperature. The same conception of dress exists to this day, undeveloped, among many uncivilized races.

At the beginning of civilization, a new element enters into the way in which dress is

regarded. Clothing becomes a means of marking the distinction of rank and office in the community. The minimum of clothing is found, with these races, only among slaves and the lowest classes in general, while garments even more complete than would be required by any considerations of modesty or of warmth begin to be worn by those in the higher ranks. Climate has still, of course, an influence concurrent with that of the new principles. The Assyrians covered themselves entirely with heavy draperies, stiff with embroidery. The Egyptians of whose dress we have the earliest records, clothed themselves in thin materials which revealed the lines of the body, frequently leaving the limbs exposed. Their dress was rich in texture and splendid in coloring, the designs of their textile fabrics being of high artistic excellence and beauty. Class distinctions were very strongly marked in their dress. A peculiar feature of the priestly garb was the leopard-skin worn on solemn sacrificial occasions. Women of rank wore beautiful embroidered skirts secured at the waist by a colored sash, or suspended by straps from the shoulders, and over this a long, loose robe. The laboring people used woolen fabrics, but their costumes, especially when at work, consisted as a rule simply of a loin-cloth and girdle. Among the Chinese the predominating idea in dress has always been splendor of material and decoration. The intense conservatism of this race is nowhere better shown than in the slightness of variation in dress from early times to the present. It will be observed in general that when a race makes a great, and especially a sudden, advance in civilization, it breaks away concurrently from its old traditions in the matter of dress. This is illustrated in the case of the modern Japanese. For a long time the figure was merely draped in loose lengths of material, with no attempt at conforming to the lines of the body or limbs—though sleeves and trousers are occasionally observed, as in the Persian sculptures at Persepolis. The primitive sandal was evidently thought to afford all necessary protection to the foot, until the time of Assur-bam-pal, or Sardanapalus, when soldiers and hunters are found to have worn a sort of net to protect their legs, and boots or gaiters somewhat like the Greek and Roman *cothurnus*, laced in front. Hats or caps were not, outside of official costume, much worn in early times. Even in the time of Julius Cæsar, they were little used except by travelers, most people preferring a fold of the toga or mantle for a head-covering. Among the Greeks and Romans the division of classes and professions by dress was very noticeable. By the Greeks the artistic effect was carried to a height hitherto unknown, their garments being the perfection of grace and dignified elegance. At no other time has the dress of a nation been of such advantage to the artist. The Greek *chiton* and *himation* of about 450-350 B.C. were the highest type of loose clothing, while the highest type of the more tightly fitting costume was found in England and France about 1350. The costumes of western Europe during the last quarter of the 14th and the first of the 15th century, were, in fact, characterized by a beautiful reasonableness and adaptation at once to use and artistic effect. But there have been other periods in which the exaggeration of good things brought about absurd

DRESS REFORM—DRESSER

degeneracy. The Norman conquest introduced a host of absurdities into England. Eccentricities in headgear especially prevailed. Shoes grew so long and pointed that they were an encumbrance to the wearer. Small waists were considered quite as essential for men as for women, and, even as late as the reign of George III. in England, tailors advertised corsets for gentlemen. The modern tendency in dress is decidedly in favor of discarding a difference of dress as a means of class distinction. The dress-reform movement of the 19th century, and the greater attention paid to hygienic considerations, have resulted in making the health and comfort of the body more important factors than they have been for many centuries. Extravagance in dress has always been a mark for social and religious reformers. Sumptuary legislation has attempted, time and time again, to regulate it, but usually without success. Both in France and in England, especially during the Puritan period in the latter country, preachers thundered from many a pulpit against the senseless fashions of their times. There are two satirical literary treatments of this aspect of dress which are especially famous, that of Swift, in the 'Tale of a Tub,' and that of Carlyle in 'Sartor Resartus.' See DRESS REFORM.

Dress Reform, a movement of the 19th century, having for its aim the modification of the dress of women along hygienic lines chiefly, but also with regard to comfort and convenience. Many forms of feminine apparel had long been operating against the health of the wearers, and the injurious effects had been more or less frankly discussed and recognized in private circles before leaders were found with sufficient earnestness and courage to undertake organized efforts for reform. A few years before the Civil War a National Dress Association was started, but made little headway. It was not until a similar society was organized in Boston in 1874 that attempts of this nature began to bear much fruit. Several causes contributed to make the time more propitious for an active propaganda against tight-lacing, high-heeled, and cramping foot-wear, trailing garments, etc. The greater attention paid to physiology in schools removed to some extent the ignorance which had been a partial excuse for unhygienic methods of dress. The increasing number of women receiving a college education insured for the new ideas an audience with minds too liberal and judgments too sound to be rigidly fettered by conventionality and fashion. A third factor not to be disregarded was the attitude of physicians. Prevention of disease and the development of normal conditions was becoming the watchword, where curative measures had formerly been emphasized. The co-operation of the medical fraternity by lectures, periodical literature and personal influence should have due recognition in the cause of dress reform. Such co-operation was a marked feature of the movement inaugurated in Boston. As the century drew to a close, conditions became still more favorable. The prominence given to bacteriology associated in innumerable minds the trailing skirt with germ-transportation. The investigation of the relative values of the different fabrics, cotton, linen, silk, and woolen, as material for underwear (a discussion in which Germany took a notable part), was very timely. It

called attention to the great lack of judgment exhibited by many persons, especially women, in protecting themselves by suitable undergarments against the changes of the season, and especially the sudden variations of the American climate. The adoption of outer garments suitable for wet weather was undoubtedly hastened by the vogue of the bicycle skirt that accustomed the eye to a style of garment once attracting unfavorable comment, or at least unwelcome observation. Rainy-day clubs have been formed in many cities and have done their share toward the introduction of the short skirt. The fact that a great number of women are now daily going to business has aided in bringing about a change in favor of simple, comfortable, and convenient garments. To athletics, also, dress reform is deeply in debt. The present popularity of out-door exercise and sport for women, and the general interest taken in physical culture have inevitably tended to modify the form of women's garments.

The practice of lacing, with its vicious results of molding the form into abnormal lines and crowding the vital organs, will undoubtedly persist among a certain class of women; but thousands are learning to admire and aim at the vigor and grace that can be obtained only by freedom of movement. Aesthetic considerations had little effect upon the earliest dress-reformers, such as Mrs. Amelia Bloomer and a few other woman suffragists who first braved public opinion by a radical change of costume. The Turkish trousers and very short skirt of Mrs. Bloomer did not invite imitation; but later phases of the reform, both in England and in America, have aimed at grace and beauty as well as health and convenience in the style of garments advocated. In the United States Mrs. Annie Jenness Miller has been a prominent exponent of the more artistic aspect of the subject. Very near the time of the establishment in this country of the second National Dress Association, an attempt was made by the crown-princess of Saxony to awaken her fellow countrywomen on the subject of dress reform, the hygienic side of the question being most prominent in that effort. In England a movement begun during the same decade was marked by aesthetic features. To retain the natural beauty of the human form, and succeed in its harmonious appareling were the aims of some of the dress reformers. There was, however, side by side with this movement, one having a utilitarian trend. This was allied to the German movement in favor of more hygienic garments; the combination of lightness and warmth in the material used being a great desideratum. Organized effort along the line of dress reform in England has resulted in the formation of the Rational Dress Association and the National Health Dress Association. There is also a society having for one of its aims a change in the customary mourning apparel. Outside of Germany and England, little interest has as yet been shown in Europe on the subject.

Dresser, Henry Erles, English ornithologist: b. Thirsk, Yorkshire, 9 May 1838. He is best known by his 'History of the Birds of Europe,' in eight volumes (1871-81).

Dresser, Horatio Willis, American author: b. Yarmouth, Maine, 15 Jan. 1866. After a varied career he became identified with one of the so-called "new thought" movements, of which

DREUX — DREWRY'S BLUFF

he is now a prominent representative. Since 1893 he has lectured and written extensively on practical philosophy and metaphysics, and he edited and published the 'Journal of Practical Metaphysics' 1896-8; but it must be pointed out that these terms, as used by him and his school of thought, have meanings entirely different from those in which they have hitherto been used and are generally understood. He is the author of: 'The Power of Silence' (1895); 'The Perfect Whole' (1896); 'In Search of a Soul' (1897); 'Voices of Hope' (1898); 'Methods and Problems of Spiritual Healing' (1899); 'Education and the Philosophical Ideal' (1900); 'Living by the Spirit' (1900); 'Voices of Freedom' (1899-1900); 'The Christ Ideal' (1901); 'A Book of Secrets, with Studies in Self-control' (1902).

Dreux, drè (ancient DUROSCASSÆ), France, one of the oldest towns on the Blaise, 20 miles north-northwest of Chartres. It has a number of churches and other buildings of the 11th, 12th, and 13th centuries. It has some manufactories, but its trade is chiefly local. Pop. 9,000.

Drevet, drê-vâ, French family of engravers. (1) **PIERRE**: b. St. Colombe, near Lyons, 1664; d. Paris 1739. He was particularly successful in the engraving of portraits. (2) **PIERRE IMBERT**, his son: b. Paris 1697; d. there 1739. He studied with his father, but surpassed him in art. He, too, was most successful in portrait work, one of his best pieces being a portrait of Bossuet after Rigand; he also copied the works of Coypel, Restout, Andray, and other French painters of the time. (3) **CLAUDE**, the nephew of Pierre Imbert: b. Lyons 1710; d. Paris 1782. He was the pupil of his uncle, and copied his style without equaling his art.

Drew, Daniel, American capitalist: b. Carmel, N. Y., 29 July 1797; d. New York 19 Sept. 1879. In early life he was a cattle drover and was subsequently prominent as a steamboat builder, but was most widely known from his connection with railroads and as a leading stock speculator in Wall Street. He was the founder of the Drew Ladies' Seminary at Carmel, and the Drew Theological Seminary (q.v.) at Madison, N. J. He also gave large sums of money to various Methodist colleges and schools.

Drew, John, American comedian: b. Dublin, Ireland, 3 Sept. 1825; d. Philadelphia, Pa., 21 May 1862. He made his first appearance at the Bowery Theatre, New York, in 1845, and later became manager, in connection with William Wheatley, of the Arch Street Theatre in Philadelphia. He acted in the principal cities of the United States, England, and Australia.

Drew, John, American actor: b. Philadelphia, 13 Nov. 1853. He is a son of the preceding and first appeared at his father's theatre in that city, and for a short season played there with Edwin Booth. He visited Europe in 1892 with Daly's company, playing classic roles, and began his starring tours in the autumn of 1892, playing in 'The Masked Ball.' In 1901 he reduplicated some of his earlier successes in 'The Second in Command.'

Drew, Mrs. John. See DREW, LOUISA LANE.

Drew, Louisa Lane, American actress: b. London, England, 10 Jan. 1820; d. Larchmont, N. Y., 31 Aug. 1897. She was the wife of John Drew (1825-62) and for a whole generation stood at the head of comedy actresses. Her

greatest success was as Mrs. Malaprop in 'The Rivals,' and as late as 1895 she assumed that character in some special performances given by veterans of the stage, such as Joseph Jefferson, etc. After her husband's death Mrs. Drew managed the Arch Street Theatre in Philadelphia for a number of years.

Drew Theological Seminary, in Madison, N. J., an educational institution founded by the Methodist Episcopal Church for the education and training of its ministers. Daniel Drew donated the ground and buildings. Tuition is free and arrangements have been made whereby the cost of student life is most moderate. In 1902 there were enrolled 180 students with seven professors. In the library were 76,000 volumes.

Drewry's Bluff, Va., an eminence on the James River, near Fort Darling, eight miles south of Richmond. See DREWRY'S BLUFF, BATTLE OF.

Drewry's Bluff, Battle of. When Gen. Grant began his campaign for Richmond in May 1864, Gen. Butler, commanding the Army of the James, was directed to be well up James River toward Richmond by daylight of the 5th and to push ahead with all energy. By the 6th Butler had reached and entrenched at Bermuda Hundred Neck. Kautz's cavalry division, moving from Suffolk, destroyed several bridges on the Norfolk & Petersburg and Weldon railroads and joined Butler on the 10th. On the 9th Butler advanced with the greater part of his force to strike the railroad connecting Richmond and Petersburg, but his advance was barred by Swift Creek, which was found impassable, and its bridges heavily guarded, upon which he ordered his troops to withdraw to their entrenchments, but the withdrawal was not effected without an attack by the Confederates on a detachment of the 10th Corps, in which the loss was severe on both sides. Butler's advance was barred by strong works on Drewry's Bluff, on the right bank of the river, eight miles below Richmond. The works could not be reached by the navy, and on the land side the Bluff was defended by 22,000 infantry and over 2,000 cavalry, field artillery, and heavy guns. On the 12th Gen. Butler moved along the turnpike and after some fighting the Confederates fell back toward Drewry's Bluff. On the 15th there was heavy all-day skirmishing and some artillery firing, and Gen. Beauregard issued orders for an attack next morning to cut Butler off from Bermuda Hundred and capture or destroy his army. The attack was made very early in the morning, under cover of a dense fog; the right of Butler's line was turned and a large number of prisoners taken, compelling it to fall back a short distance. On the left Butler's line held its ground and made some progress, but toward evening Butler ordered his troops to fall back, and at night they were in their entrenchments at Bermuda Hundred. Beauregard followed and entrenched in front of Butler's lines. As Gen. Smith says, "Both corps re-entered the historic bottle, which was at once carefully corked by a Confederate earthwork." On the 20th Beauregard assaulted and carried some of Butler's advanced lines and a sharp fight ensued to regain them, which was only partially successful, a portion of them being retaken by Howell's brigade of the Tenth corps, which lost 702 men;

DREXEL — DREYFUS

the Confederate loss was nearly 800. On the 29th Gen. Smith with three divisions of the Tenth and Eighteenth corps, 16,000 men, and 16 guns, left the Army of the James and joined the Army of the Potomac, in time to take part in the battle of Cold Harbor. The Union forces engaged in the Battle of Drewry's Bluff, 16 May, numbered about 16,000; the Confederates about 18,000. The Union loss, 14-16 May, was 390 killed, 2,380 wounded, 1,390 missing. The Confederate loss, 16 May, was about 460 killed, 2,060 wounded, 212 missing. From 5-31 May, including all of Butler's engagements and Kautz's cavalry operations, the Union loss was 609 killed, 3,769 wounded, 1,580 missing; the Confederate loss for the same period cannot be definitely ascertained, but it was less than that of the Union forces. See 'Official Records,' Vol. XXXVI.; 'Butler's Book'; Grant, 'Personal Memoirs'; Humphreys, 'The Virginia Campaign of 1864-5'; Roman, 'Military Operations of Gen. Beauregard,' Vol. II.; and 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Drexel, Anthony Joseph, American banker; b. Philadelphia, Pa., 1826; d. Carlsbad, Germany, 30 June 1893. He became the head of the well-known firm of Drexel & Company, Philadelphia, having been identified with it from the age of 13. He was zealous in promoting science and art, especially music, and contributed largely to philanthropic and educational interests. The Drexel Institute of Art, Science and Industry, Philadelphia, dedicated 18 Dec. 1891, was established by him, the building costing over \$600,000 with an endowment fund of \$1,000,000.

Drexel Institute of Art, Science, and Industry was founded at Philadelphia in 1891, by Anthony J. Drexel (q.v.). This school was established for the purpose of giving young men and women opportunity to receive training in the arts and sciences as applied to the industries. The requirements for admission depend upon the course which the applicant wishes to pursue; no degrees are given. The buildings and equipments, given by Mr. Drexel, cost over \$4,000,000; and the amount of endowment, given also by Mr. Drexel, is \$2,000,000. The courses offered are: Fine and applied arts; elective engineering; commerce and finance; mechanical drawing and machine construction; domestic science; mathematics; physics; chemistry; and English. Day and evening classes are provided for all departments. The length of time required to complete the work depends upon the course. The free public lectures provided by the Institute are valuable educational factors.

The department of commerce and finance consists of three special departments: First, the course in commerce and finance; second, the office course; third, the evening course. These courses are founded on a broad and liberal basis, resembling generally the commercial schools of Europe, and they are intended to place commercial education in its proper relation to other departments of educational work. The object of the course is to train the young to do business rather than simply to record business. It provides a liberal and practical course of study for a two years' training in the knowledge of the world's industries and markets, the laws of

trade and finance, and the mechanism and customs of business. The first special department is intended to give a thorough fundamental training for the activities of business which include: (1) The production, sale, and transportation of articles of commerce; (2) the management of stock companies and corporations; (3) the buying and selling of securities; (4) the importing and exporting of merchandise; (5) the borrowing and lending of money and credit; (6) the advertising of commercial concerns; (7) the keeping of business records. In addition three distinct office courses are offered, practical in character and designed to prepare the student for entering immediately upon the respective lines of employment to which the training leads. In 1895 a beginning was made toward the formation of a permanent commercial museum. The collection now represents quite fully the following industrial products: Flour, wool, petroleum, tea, coffee, sugar, cotton, copper, iron and steel, glass, tobacco, leather, paper, wood, carpets, linen, spices, aluminum, building stone, brick, and terra-cotta. The art museum contains collections representing the industrial arts of Egypt, India, China, Japan, and Europe. The library contains about 30,000 volumes, and is supplied with books, periodicals, and pamphlets bearing upon the work, and every facility and assistance is afforded for the study of financial, economic, and commercial questions. In 1902 the number of students in attendance in the day classes was 1,200 and in the evening classes 2,000. Applicants for admission to any course must pass satisfactory examinations in English, geography, arithmetic, and United States history. For admission to the course in commerce and finance or to any of the office courses the candidate must be at least 16 years of age. The diploma of a high school of approved standing is accepted in place of an examination.

Dreyfus, drâ-füs, Abraham, French playwright; b. Paris, 20 June 1847. He had a fine vein of kindly humor, and it pervaded both his contributions to the public journals and his theatrical compositions, which are mostly in one act. Among them are: 'A Gentleman in Black'; 'The Victim'; 'The Klepht'; 'A Break.' His four-act play, 'The St. Catharine Institution,' a comedy of manners, was brought out at the Odéon (1881); 'A Rupture' (1885); etc.

Dreyfus, Alfred, French military officer; b. Alsace 1859. He was a member of a wealthy Jewish family. On 14 Oct. 1894 he was arrested on a charge of communicating certain important military documents to a foreign government, and at a secret court-martial, on 19 December, and succeeding days, was found guilty and condemned to public degradation and lifelong imprisonment. He was degraded on 5 Jan. 1895, and in accordance with an act passed by the chambers was sent to the Ile du Diable (Devil's Island) near Cayenne, to undergo the other part of the sentence. On 1 June of the same year Col. Picquart became head of the Intelligence Department of the army, and in the course of his official duties discovered various circumstances which threw doubt on the correctness of the court-martial's decision, and pointed to another officer, of the name of Esterhazy, as the real

DREYFUS CASE — DRIFT

traitor; and in particular he obtained a copy of a telegram-card, subsequently known as the *petit-bleu*, alleged to have been addressed to Esterhazy by a German officer, Col. von Schwarzkoppen. On 7 Sept. 1896, he wrote to Gen. Gonse urging a reinvestigation of the case, and seven days later a newspaper divulged the fact that certain documents had been communicated to the court-martial unknown to the prisoner's counsel. Not long afterward a facsimile of the *bordereau* (memorandum, detailed list of documents), alleged to have been written by Dreyfus and largely contributing to his condemnation, was published in another newspaper, and on 16 November, Col. Picquart was superseded in his office by Col. Henry. On 15 Nov. 1897, M. Mathieu Dreyfus, brother of the condemned man, charged Esterhazy with having written the *bordereau*, but on 11 Jan. 1898 he was acquitted by a court-martial which sat with closed doors. On the following day Col. Picquart, who had been sent to Tunis after his dismissal from office, and had been afterward recalled to answer certain charges made by Esterhazy, was arrested and imprisoned. On 13 January, M. Zola, the eminent novelist, published in the *Aurore* a letter headed *J'accuse* (I accuse), in which he made serious charges against the general staff and the government in regard to the Esterhazy court-martial. After a stormy debate in the chamber it was decided to prosecute him; but the government steadily refused to reopen the Dreyfus case, declaring their determination to stand by the *chose jugée*. Zola's trial began on 11 February, and on the 23rd he was condemned to pay a heavy fine and to undergo a term of imprisonment. On 2 April the court of cassation quashed the sentence on Zola on technical grounds, but a fresh prosecution was ordered a few days later. On 27 June M. Cavaignac became head of the war office, and 7 July he read to the chamber several documents which he regarded as proving the guilt of Dreyfus, but three days later Col. Picquart wrote to the premier denouncing these documents as forgeries. This interference led to his rearrest, and shortly after Zola was again condemned. On 31 August Col. Henry was arrested, and confessed to having forged the chief document relied on by Cavaignac, but soon after his arrest he committed suicide. The war minister resigned 4 September, and was succeeded by Gen. Zurlinden. The latter resigned because of the government's determination to refer the question of revision to a commission, and on 18 September Gen. Chanoine succeeded him. The commission decided against revision, and on 26 September the government resolved to ascertain the view of the court of cassation. On 25 October the Brisson ministry resigned, and a few days later the court reported in favor of revision. On 31 October a new ministry under M. Dupuy came into office, and on 9 December the prosecution of Picquart was stopped by the court of cassation. On 16 Feb. 1899, M. Félix Faure, the president of the republic, died suddenly, and three days later was succeeded by M. Emile Loubet. On 3 June of the same year the court of cassation, having concluded its hearing of the evidence, ordered a fresh court-martial to be held at Rennes for the purpose of deciding whether Dreyfus communicated to a foreign government any of the documents mentioned in the *bordereau*, of which Esterhazy had previously

confessed himself to be the author. Picquart was released on 9 June, and on the 12th of the same month the ministry was defeated. On 22 June M. Waldeck-Rousseau succeeded in forming a new ministry. The new court-martial opened 7 August, under the presidency of Col. Jouaust, and about this time the press published accounts of the inhuman treatment of Dreyfus in his prison. Dreyfus, who had been brought to Rennes for trial, was defended by MM. Demange and Labori. The chief witnesses in favor of the prisoner were Col. Picquart and Capt. Freystätter, a member of the first court-martial, and against him were the Gens. Mercier, Gonse, Roget, de Boisdeffre, and Billot. An attempt to kill M. Labori on his way to court 14 August was fortunately unsuccessful. On 8 September M. Demange delivered a brilliant speech on behalf of the prisoner, but on the following day the judges, by five votes to two, declared the prisoner guilty, with extenuating circumstances. This verdict was so flagrantly opposed to the published evidence (this court-martial held most of its sittings in public) that it was received with indignation and contempt throughout almost the whole civilized world. Dreyfus was sentenced to 10 years' imprisonment in a fortress, but a subsequent full pardon from President Loubet set him at liberty. Several times during the progress of the case France seemed on the verge of revolution, and anti-Semitic fanaticism and insane glorification of the army proceeded to almost incredible lengths. The case lasted during the tenure of office of six ministries and formed a subject of official consideration for three presidents and nine ministers of war.

Bibliography.—See Dreyfus, 'Five Years of My Life' (1901); Barlow, 'History of the Dreyfus Case' (1898); Conybeare, 'The Dreyfus Case' (1898); Eugon, 'The Dreyfus Case' (1898); Steevens, 'The Tragedy of Dreyfus' (1899); Marin, 'Comptes-rendus officiels' (1897); Vanex, 'Dossier de l'affaire Dreyfus' (1898); Brez, 'Le solécisme du *bordereau* et des lettres de Dreyfus' (1898); Esterhazy, 'Les dessous de l'affaire Dreyfus' (1898).

Dreyfus Case. See DREYFUS.

Dreyschock, Alexander, Bohemian pianist and composer: b. at Zack, Bohemia, 15 Oct. 1818; d. Venice 1 April 1869. After eight years' public concert performance he began to travel, in 1838, for the purpose of developing his art. In response to an invitation from the directors of the Imperial Conservatory, St. Petersburg, he visited that city. There he stayed from 1863 until failing health compelled him to seek a milder climate.

Dreyse, Johann Nikolaus von, yō'hān nik'-o-lows fōn drī'zē, German inventor: b. Sömmerda, Erfurt, Prussia, 20 Nov. 1787; d. 9 Dec. 1867. He worked as a locksmith in Germany, and in a musket factory in Paris 1809-14. He then founded an ironware factory in Sömmerda, and began the manufacture of percussion-caps under a patent in 1824. In 1827 he invented a muzzle-loading, and in 1836 a breech-loading needle-gun, which was adopted in the Prussian army in 1840. A large factory was at once established, which produced 300,000 weapons between 1841 and 1863. In 1864 Dreyse was ennobled.

Drift, or Glacial Drift, a general name given to the deposits made by the ice sheets of

DRIFT SAND — DRILLS

the glacial period, or by the water which came from them. By some geologists the term is restricted to the unsorted deposits left by the ice itself, the deposits worked over by water being called stratified or modified drift. In this restricted sense drift includes (1) lateral and terminal moraines and (2) till, boulder clay or "hardpan," the sheet of clay that frequently covers rock surfaces in the glaciated regions. Drift is sometimes more or less sandy and always contains angular boulders with polished and often striated surfaces, the boulders being scattered through the clay without order. Usually the boulders are derived from rocks near by, but fragments of tough hard rocks were sometimes transported long distances before being ground up by the action of the ice. Thus boulders from the peridotite at Cumberland Hill, R. I., have been found in the till of Martha's Vineyard, Mass., over 30 miles distant. The exact method by which till was formed is in dispute among geologists, though it is generally regarded as the ground moraine of the ice sheet, in spite of the fact that present glaciers are not forming a similar deposit. The boulders in the till in New Zealand are sometimes as much as 20 feet in diameter and in some places the till is so full of boulders as to render the soil formed from it unfit for agriculture. In northwest Ohio the till in many places is over 100 feet deep and as it includes the detritus from softer rocks such as limestones, in that region boulders are fewer than in New Zealand and the resulting soil is very fertile. Engacial drift is the rock detritus carried along in the body of a glacier. See GLACIER; GLACIAL PERIOD; SOIL.

Drift Sand is sand thrown up by the waves of the sea and blown when dry some distance inland until arrested by large stones, tree roots, or other obstacles, round which it gradually accumulates until the heaps attain considerable dimensions. When these mounds have reached a certain elevation they are urged farther inland. "The same wind," says Cuvier, "that drives the sand from the sea upon the mound, drives the sand from its summit to its land side." In some parts of the coasts of France, the Landes of Brittany, in particular, these inroads upon the land have been attended with destructive consequences. The quantity of sand annually deposited along that coast is estimated at 3,000,000 cubic feet, and its annual progress inland some 72 feet. Such has been its destructive effects upon a village of Brittany that nothing is visible of it except a portion of the church steeple. For the purpose of arresting the inland progress of drift sand various measures have been adopted, the most successful being the planting of sand-loving plants with long creeping roots, such as *Carex arenaria*, which help to fix the sand and break the influence of the wind. In France the drift sands of the Biscay gales have been checked in their encroachments by the planting of fir-trees in solid belts along the shores.

Drill, a baboon of West Africa, the *Cynocephalus leucophaeus*, closely allied to the mandrill (q.v.), whence its abbreviated name. It is, however, smaller than the mandrill, has a black face, and a short, erect tail, not two inches long.

Drill, Borer, or Snail-bore, a small muricine gastropod mollusk the American *Urosalpinx cinerea*, so named on account of its destructive

propensities in boring through the shells of young oysters and feeding on them. The drill occupies a spiral, brownish shell, about an inch long, and is found along the Atlantic coast north of Florida, becoming scarce above Massachusetts.

Drilling, sowing in parallel rows as distinguished from sowing broadcast. It was introduced into England by Jethro Tull, who published a work on the subject in 1731. He saw that mere plowing and rough harrowing were not cultivation, but only its rudimentary operations; and that the soil required to be stirred and pulverized, not only before sowing, but also after the plants had appeared above ground, in order that weeds might be extirpated and fresh particles of soil brought in contact with the roots of the crop. The plan of sowing in drills or ridges, and hoeing in the intervals was therefore adopted by Tull as the best means to attain his objects. The advantage of sowing in drills has stood the test of experience, and drill husbandry, by combining the advantages of continued tillage with those of manure and a judicious rotation of crops, is a marked improvement on the old mode of sowing all seeds broadcast. The crops which are now generally drilled are turnips, potatoes, beans, peas, carrots, clover, cereals, flax, etc. Drilling is of more importance on dry than on moist soils, as in the former weeds are more apt to spring up and injure the crops.

Drills, or Drilling Machines, instruments such as rock drills, percussion drills, diamond drills, etc., for perforating stone, metal, and other hard substances, as distinguished from wood-boring tools. Under the article BORING, descriptions will be found of these various machines, to which may be added that of the steel-shot core drill, a recent Australian invention, and an inexpensive substitute for the higher priced diamond drill. Mr. Davis, the inventor, first attempted the construction of a toothed bit or cutter made of hardened steel. With this he was successful in soft and moderately hard rock, but for the hardest formations he still had to use a diamond drill. It was not until he had invented the "shot bit" that the diamond drill could be entirely dispensed with. This bit is a soft steel cylinder in connection with which small chilled steel shot are used. The bit grinds the shot into the rock, thus gradually wearing it away, or to be more correct the action of the shot on the rock is one of crushing rather than grinding, and for this reason the smooth bearing surface of the shot bit shows but little wear.

The arrangement of the drill and its accessories is as follows: The hollow drill rods are rotated by any available geared driving means. The lower drill rod is surrounded by a "calyx" or tube, and the two are joined at their lower ends by a plug. The centre portion of the plug serves as a bearing for a protecting ring, and on its lower end a ring is threaded, while to this the core barrel is attached on which either the shot bit or the cutter can be threaded. The shot bit is provided with a triangular notch in its lower end, one of the walls of the notch being vertical and the other forming an angle of 30° therewith. The steel shot, which are fed through the hollow rods from the top, are carried by a current of water under this notch, and the inclined wall drags them under

the edge of the shot bit. The sizes of shot used vary with the nature of the rock to be drilled, some being as large as duck shot and the smallest being very much finer. The working edge of the shot bit is rounded, so that the shot grinds not only directly beneath the drill, but also to a certain extent at the inner and outer sides, thus cutting out proper clearance for the operation of the drill. Water is pumped into the hollow drill-rods through a pipe and passes out under the bit and up the annular space outside the core barrel, carrying with it the sludge or fine particles ground up by the shot. The current of water flows with great strength up as far as the top of the calyx, where the annular space widens considerably, so that the current is reduced and the sludge it carries drops by gravity into the calyx; the calyx, therefore, providing an additional record of formations penetrated. It is particularly useful when drilling with the cutter bit through matter which is too soft to form a good core.

The weight of the drill-rods is ordinarily sufficient to properly feed either the shot bit or the cutter. When additional pressure is necessary, this may be exerted by turning a hand-wheel geared to a pair of winding drums, on which are coiled the ends of a strap passing over pulleys at the top of the drill. When it is desired to remove the core, coarse gravel is poured down the hollow tubes, which wedges in between the core and core barrel so tightly that on lifting out the core barrel the core breaks away and comes up with it.

Drimys, drĭ'mĭs, a genus of plants belonging to the order *Magnoliacea*. They are distinguished by their bitter, tonic, and aromatic qualities. *D. winteri*, or *aromatica*, carried to Europe by Captain Winter from the Straits of Magellan in 1579, yields Winter's bark, which has been employed medicinally as an aromatic stimulant. It somewhat resembles canella bark. The bark of *D. granatensis* is used in Brazil against the colic. It is tonic, aromatic, and stimulant. That of *D. axillaris*, a native of New Zealand, has similar qualities.

Drink. See DIETETICS.

Drip Stone, a corona or projecting tablet or molding over the heads of doorways, windows, archways, niches, etc., to prevent rain-water from trickling down. Called also a label, weather-molding, water-table, and hood-molding. The term label is usually applied to a straight moulding. Also a filtering stone, so called by sailors.

Drisler, Henry, American classical scholar: b. Staten Island 27 Dec. 1818; d. New York 30 Nov. 1897. He was graduated from Columbia in 1839, was appointed tutor of Greek and Latin there in 1843, adjunct professor in 1845, professor of Latin in 1857, and of Greek in 1867. He was acting president of Columbia at the time of President Barnard's absence as one of the commissioners to the Paris Exposition in 1867, and again in 1888, and became dean of the School of Arts in 1894. He assisted Dr. Anthon in the editing of classical text-books, prepared a new edition of Liddell and Scott's Greek Lexicon, and co-operated on the seventh Oxford edition.

Drive, a course upon which carriages are drawn or horses driven, a road prepared for

driving. To be conveyed in a carriage; to travel in a vehicle drawn by one or more horses or other animals.

Driver, Samuel Rolles, English biblical scholar and divine: b. Southampton 2 Oct. 1846. He studied at Winchester, and New College, Oxford, was for some years a Fellow and tutor of his college, and from 1876 till 1884 a member of the Old Testament Revision Company. In 1883 he was appointed to the regius professorship of Hebrew at Oxford, at the same time becoming canon of Christ Church. Among his numerous works may be mentioned: 'A Treatise on the Use of the Tenses in Hebrew, etc.' (1874); 'Isaiah: His Life and Times, and the Writings which bear his Name' (1888); 'Notes on the Hebrew Text of the Books of Samuel, with Introduction on Hebrew Palæography' (1890); 'Introduction to the Literature of the Old Testament' (1891), a work suited for popular reading, which has passed through a number of editions; 'Sermons on Subjects connected with the Old Testament' (1892); the Book of Leviticus (1894-8) in 'The Polychrome Bible,' with H. A. White; 'Commentary on Deuteronomy' (1895); 'Commentary on Joel and Amos' (1897); 'Commentary on Daniel' (1901). He was one of the editors of the 'Variorum Bible,' with various renderings and readings and valuable other aids to the study of the Scriptures, published by Eyre and Spottiswoode in 1880; and with Neubauer translated a series of Jewish commentaries on the 53d chapter of Isaiah. He is also joint editor of the 'Hebrew-English Lexicon of the Old Testament.'

Driver-ant, a nomadic predatory ant (*Anomma arcuus*) of western Africa, which makes its forays in column-like masses, driving other animals in fear before it, and forcing the negroes out of their villages.

Driving. Driving vehicles or riding furiously and recklessly in a public place, to the danger of the lieges, is an offense at common law in England, and may be prosecuted as culpable neglect of duty according to the law of Scotland. It has, however, been made a statutory offense, and a long series of acts passed to regulate the misconduct of drivers of public carriages, under which prosecutions are now as a rule brought. In the United States, furious driving in cities generally is a misdemeanor punishable by fine and imprisonment. In the absence of State laws, municipalities regulate the rate of driving. In most cities pedestrians have the right of way at street and road crossings. See also COACHING; RIDING.

Drogheda, drōh'ë-dä, Ireland, seaport in the southeast of county Louth; on the river Boyne, four miles from its mouth; 32 miles north of Dublin, and 81 miles south of Belfast. In 1494, the Irish parliament, then in session at Drogheda, passed under compulsion, the "Poyning's laws," sometimes called the "Statutes of Drogheda." In 1649, Cromwell stormed the city and massacred the garrison. William III. took possession of the city the day after the "Battle of the Boyne." Pop. 11,873. See POYNING'S LAWS.

Drohobycz, drō-hô'bĭch, Austria, town in Galicia, 41 miles south-southwest of Lemberg. It has an important trade, chiefly with Hungary, in corn, leather, linen, earthenware, and particularly salt, obtained from salt springs in the

DROITWICH — DROPSY

vicinity. Near the town are valuable iron mines and pitch wells. Pop. 17,784.

Droitwich, droit'ich, England, a market town, six miles northeast of Worcester, on the banks of the Salwarp. Droitwich is supposed to have been the *Salinæ* of the Romans, and some Roman remains have been discovered. It is still famous for its brine springs, rising near the centre of the town through strata of red sandstone and gypsum, and from which, as appears from grants to the church of Worcester, salt has been manufactured for more than 1,000 years. Pop. 4,256.

Drôme, drôm, France, a department, covered almost throughout by ranges of the Alps, the average height of which, however, does not exceed 4,000 feet; area, 2,518 square miles. Wines, olives, chestnuts, and silks are staple productions. Valence is the capital. Pop. (1901) 294,704.

Dromedary, the name of an improved variety of the one-humped camel (*Camelus dromedarius*), especially bred for riding owing to its extraordinary fleetness and power of endurance. It is able to travel at the rate of nine miles an hour, for many hours, without rest or food. Its ordinary gait is a trot; if forced to gallop, it soon gives up. See CAMEL.

Dromgoole, William Allen (Miss), American author: b. Murfreesboro, Tenn., 26 Oct. 1860. She was for several years engrossing clerk in the State capitol at Nashville, and after teaching school in Tennessee and Texas for a few years, took up the literary work in which she has since been engaged. She has written: 'The Heart of Old Hickory' (1895); 'Valley Path' (1898); 'The Farrier's Dog and His Fellow' (1899); 'Three Little Crackers from Down in Dixie' (1898); 'Rare Old Chums' (1898); 'A Boy's Battle' (1898); 'Cinch, and Other Tales of Tennessee' (1898); 'The Moonshiner's Son' (1898); 'Harum-Scarum Joe' (1899); 'The Battle on Stone River' (1899).

Dromios, The, two characters in Shakespeare's play the 'Comedy of Errors.' They are twin brothers of close resemblance, who had been separated early in life, and who meet as the respective attendants of Antipholus of Ephesus and Antipholus of Syracuse.

Drone, Eaton Sylvester, American journalist: b. Zanesville, Ohio, 25 Jan. 1842. He was graduated at Harvard 1866; was admitted to the New York bar in 1869; became the New York *Herald's* staff writer on legal subjects 1880, and later was made editor-in-chief of that paper. He has published: 'Law of Property in Intellectual Productions, in Great Britain and the United States, embracing copyright in works of Literature and Art, and Playwright in Dramatic and Musical Compositions' (1879).

Drone. See BEE.

Drone-fly, a dipterous insect (*Eristalis tenax*) of European origin, but first described as an American fly in 1870. It prevails from the Atlantic to the Pacific, and so closely resembles the honey-bee in size and color, that the two are often confounded. Living on the juices of flowers, particularly upon those of agreeable fragrance, it hovers about dwellings and windows late in the autumn.

Dron'go, or **Drongo-shrike**, a passerine bird of the family *Dicruriæ*, represented by many

species in Africa, Southern Asia, and Australia. The typical and most familiar species is the Indian *Dicrurus ater*. Of a glossy black color, it has the stout, hooked bill and forked tail of the shrike. Its food consists of insects, which it often captures on the wing. In India it is a common bird, where by Europeans it is called "king-crow" from its habit of routing crows and other large birds in defense of its nest.

Drongo Cuckoo (*Surniculus dicruroides*), an East Indian bird of the order *Picariæ*. It is especially interesting to biologists as a conspicuous example among animals of imitation, according to which one group of animals gradually assumes some characters of another and a different group, when such features are advantageous. Structurally, the drongo cuckoo is true to the picarian order, having the yoked toes — two in front and two behind, — and resembles the cuckoo, of the same order, in its habits of nesting and of egg-laying. But in other respects it exactly imitates the drongo-shrike, having the same description of plumage and color, with the furcated tail, and inhabits the same locality.

Drontheim, drönt'hîm. See TRONDHJEM.

Droogenbroeck, Jan van, yân vâd droo'gên-brêk, Flemish poet: b. St. Amand-on-Scheldt 18 Jan. 1835. He was long an educator of eminence, and issued his first verse collection, 'Ghazels and Makames' (Arabian terms for stanzas and songs) in 1866, under the pseudonym of JAN FERGUNT; his subsequent volumes, on Camoens and other important subjects, fully sustaining his reputation.

Droppers, Garrett, American educator: b. Milwaukee, Wis., 12 April 1860. He was graduated at Harvard 1887, and later studied at the University of Berlin 1888-9. From 1889 to 1898 he was professor of political economy and finance in the University of Tokio, Japan. He was secretary of the Asiatic Society of Japan and contributed to its 'Transactions' several important and valuable articles on Japanese currency questions. Since 1898 he has been president of the University of South Dakota at Vermilion, S. D. He has published a 'Translation of Schopenhauer's Essays' (1881).

Dropsy. This is a symptom rather than a disease. It consists of an accumulation of fluid in the subcutaneous tissues and serous cavities of the body. A number of localized forms of dropsy have received special names, such as dropsy in the abdomen — ascites; dropsy of the chest, hydrothorax; dropsy of the testicle, hydrocele; dropsy in the brain, hydrocephalus. The terms cedema and anasarca are also used as somewhat synonymous with dropsy; œdema meaning, however, more of a puffiness of certain portions of the body, and anasarca signifying a generalized and widespread dropsy. The main causes for the symptom known as dropsy are (a) insufficient strength of heart-action, allowing the serum of the blood to wander outside the blood vessels, and (b) some obstruction, preventing the return of the blood to the heart. The most important cause of dropsy is some disease of the heart and blood vessels whereby there is either increased forward or arterial pressure, or increased backward or venous pressure. The latter is of more importance

than the former. Some vital alteration in the walls of the capillaries is important in bringing about the phenomena. The treatment of dropsy is technical to a high degree, inasmuch as the causes are frequently obscure. See HEART DISEASE.

Drop'wort, a plant belonging to the natural order *Rosaceæ*. It has pinnate leaves with serrated segments, and in habit resembles the meadow-sweet (*Spiræa salicifolia*), from which it may be distinguished by its scentless flowers and its different habitat. It was formerly included in the same genus, but is now assigned to *Porteranthus*, so named after Prof. T. C. Porter. It is known also as bowman's root. The hemlock dropwort, or water dropwort, is *Oxypholis rigidus*, an umbellifer growing in swamps from New York to Florida, and westward to Minnesota, and Louisiana. It is poisonous.

Droseraceæ, drös-e-rä'se-ë, the Sundew family, marsh plants, and natives of temperate and warm climates. The family has six genera, and about 125 species, known throughout the world. Among members of the family are *Venus flytrap* (*Dionæa muscipula*) (q.v.), and *Parnassia*. The family is represented in America by the typical genus of the order *Drosera*, which has about 110 species, most abundant in Australia. Seven species of the sundews are found in various parts of North America.

Drosky, drös'kī, **Drosky**, or **Droschky**, a kind of very small, light, four-wheeled carriage used by the Russians. It is not covered, and in the middle there rises a sort of bench placed lengthways. When there is only a single person in the drosky he generally throws one leg on each side of this bench, but the conveyance is also capable of holding two persons. The wheels are covered with wings, which keep off the mud. The term is now applied to several other kinds of vehicles.

Drosom'eter (from the Greek *drosos*, dew, and *metron*, a measure), an instrument for ascertaining the quantity of dew which falls. It consists of a balance, one end of which is furnished with a plate fitted to receive the dew, the other containing a weight protected from it.

Drossinis, drō-sē'nes, **Georg**, Greek poet: b. Athens 21 Dec. 1859. He has published five volumes of lyrics: 'Spiders' Webs' (1880); 'Stalactites' (1881); 'Idylls' (1885); 'Straw Flowers' (1890); 'Amaranths' (1891); also some stories and other minor works in prose. A charming simplicity of language characterizes all his works.

Drouais, Jean Germain, zhōn zhâr-măn droo-â, French painter: b. Paris 25 Nov. 1763; d. Rome 13 Feb. 1788. He was a pupil of David and having gone to Rome to study was, in 1784, successful in carrying off the great prize, his subject on that occasion being, 'The Canaanitish Woman at the Feet of Jesus.' His 'Dying Gladiator,' and particularly his 'Marius at Minturnæ,' on being exhibited in Paris, gained for him and David's school a new triumph.

Drouet, Henri, ôn-rê droo-â, French naturalist: b. Troyes 1829. He early became known by his researches in natural science, and in 1855 published 'Énumération des mollusques terrestres et fluviatiles vivants de la France continentale,' due to his travels examining govern-

ment and private collections throughout France and his personal observations, which were extended in 1857 by a scientific journey through Portugal. He held a government position in the departmental administration from 1858 to 1870. The chief of his further publications are: 'Les mollusques terrestres et fluviatiles de la Guyane française' (1859); 'Sur terre et sur mer' (1870); and 'Alger et le Sahel' (1887).

Drouet, Jean Baptiste, zhōn bap têt droo-a, **Comte d'Erlon**, French marshal: b. Rheims 20 July 1765; d. Paris 25 Jan. 1844. His conduct in the Peninsular war was highly distinguished. After the fall of Napoleon he was arrested on the charge of conspiring against the royal family. On the return of Napoleon from Elba he contrived to seize the citadel of Lille, in which he had been imprisoned, and held it for the emperor, who made him a peer of France. At the battle of Waterloo he commanded the 1st corps d'armée. After the capitulation of Paris he fled to Bavaria, where he resided till the July Revolution, when he returned to France, and received in 1832 the command of the army of Vendée. During 1834-5 he held the office of governor-general of Algeria, and in 1843 was elevated to the rank of marshal.

Drouyn de Lhuys, Edouard, â-doo-âr droo-ân dè lû-ës, French statesman: b. Paris 19 Nov. 1805; d. there 1 March 1881. In 1840 he was placed at the head of the commercial department under the minister of foreign affairs, and shortly after was elected deputy for Melun; but he afterward was deprived of his office because of his opposition to the government. Under Louis Napoleon's presidency he became minister of foreign affairs. After the *coup d'état* he became one of the vice-presidents of the Imperial Senate, and again minister of foreign affairs. In 1855 he resigned his office; in 1863 he was recalled to his old post, resigning again in 1866.

Drown, Thomas Messinger, American educator: b. Philadelphia, Pa., 19 March 1842; d. Bethlehem, Pa., 16 Nov. 1904. After graduating in medicine at the University of Pennsylvania in 1862 he pursued the study of chemistry at Yale, Harvard, and Heidelberg for seven years, from 1874-81, occupied the chair of analytical chemistry at Lafayette College, and for 10 years a similar chair at the Massachusetts Institute of Mining Engineers. He was one of the founders of the American Institute of Mining Engineers, and served with marked efficiency for 10 years as its first secretary and editor of its 'Transactions,' being later elected to honorary membership, and in 1897 to its presidency. Dr. Drown did very important original work in quantitative analysis both in metallurgy and in sanitary chemistry. In 1895 he was called to the presidency of Lehigh University, and by careful and intelligent guidance placed it in its present high position among American schools.

Drowning, a form of asphyxia induced by submergence in water or other fluid. As a rule in drowning the body is submerged, but Peterson and Haynes in their recent 'Legal Text-book' relate the case of an epileptic patient who, while walking on a low, sandy beach, fell in a paroxysm with his face down, causing by his spasmodic movements a small excavation of an inch

DROWNING

and a half in depth in the sand beneath his face. This small depression filled with water and he was found dead from asphyxia about an hour or more after the occurrence. Most cases of drowning result from asphyxia, by which is meant the body becomes poisoned from the lack of oxygenation of the blood, since no oxygen can enter the lungs from the fluid, in a form that can be utilized. Heart failure sometimes occurs in drowning. At one time drowning was a legal method of execution and prevailed in England until the early part of the 17th century; it was much practised in other European countries some years later. It is a frequent method of suicide, fully one third of the cases taking this method. Danger from drowning to swimmers depends very largely upon the ability of the swimmer, although this is not a guarantee of safety, since many excellent swimmers have been known to be unable to sustain the fatigue of being long in the water, and sometimes succumb suddenly from muscular cramps or from attacks of syncope. Persons who have respiratory defects, such as asthma or stammering, or who have organic disease of the circulation, are more liable to drown. Drowning occurs more often among men than among women, because of the greater amount of exposure. Extreme coldness of the water seems to be an important factor in augmenting the danger from drowning. Good health, muscular vigor and calmness of mind are of great importance in cases of danger from impending drowning. With reference to the symptoms there is great variability. Some people who have been submerged suddenly, and in water of low temperature, are found dead on almost immediate rescue. Here probably the nervous shock and deficient heart action accounts for the result. In a great many more cases, however, there is spasmodic closure of the glottis from direct irritation of the water as it enters the nose and mouth, and from nervous reflexes due to sudden chilling of the surface. Many of these patients sink to the bottom at once and remain below the surface, unconsciousness occurring in the course of a few seconds. The respiratory movements are few and convulsive and the heart stops. In the greater number of cases, however, asphyxia results from the entrance of water into the lungs; the individual struggles to come to the surface and as soon as the surface is reached attempts are made to fill the lungs by long inspirations. This very frequently draws a small amount of water into the larynx and then involuntary convulsive efforts result. With each convulsive inspiration more water is drawn in and thus pulmonary congestion becomes more and more pronounced. The struggle for life becomes violent and the patient frequently grasps at everything in sight, even tearing handfuls of mud from the bottom of the body of water. During the convulsive seizures the face becomes blue, the eyes bulge, the features become contorted, the pulse rapid and feeble. Oftentimes the bladder and rectum are emptied. After a few minutes, five or six, respiration ceases; four to six minutes more, sometimes longer, the heart continues to beat, gradually failing in strength and rapidity.

Treatment of all cases of drowning should be insistent and prolonged. If there is a great deal of water in the chest, the chances are lessened. Instances have been recorded in which

patients have been submerged 20 or 30 minutes and have recovered, but if the body has been beneath the surface for over 4 or 5 minutes the general chances of resuscitation are slight. If attempts at resuscitation are made,—and they should always be made unless the body has been under water several hours,—the body should be placed face downward, the head and shoulders depressed, so as to favor drainage of water from the lungs, and all efforts should be directed at first toward the restoration of breathing. The application of hartshorn, smelling salts, or snuff to the nostrils, tickling the throat with a feather, dashing cold water and hot water alternately on the chest and face, and vigorous friction of the upper part of the body to create warmth are of value, as also wiping and cleansing the mouth; surrounding the patient with hot bottles; and hot rectal irrigations of salt solution or whiskey. If these preliminary efforts fail, artificial respiration should be resorted to and continued for several hours. The patient should be still kept face downward, a folded coat or other article of dress raising and supporting the chest. The weight of the body on the chest forces the air out, then turning the body well over but gently on one side, then turning it on its face again, repeating these movements about 15 times in a minute, occasionally varying the side, at each turn and relief of the chest pressure, air enters the lungs and excites breathing. This operation should be assisted between each turn of the body, by brisk and uniform pressure between and below each shoulder-blade. At the same time, but without interfering with these operations, the hands and feet should be dried, wet clothing removed, and the body enveloped in warm blankets or reclothed with dry garments. Should these efforts prove unavailing after from two to five minutes, recourse should be had to Dr. Silvester's method, which consists in placing the patient on the back, on a flat surface inclined slightly upward from the feet, the head and shoulders being raised and supported on a small cushion, or folded article of dress placed under the shoulder-blades. The tongue should be drawn forward, and fastened by an elastic band, string, or tape over the tongue and under the chin, to keep it projecting beyond the lips. Then to imitate the movements of breathing and to draw air into the lungs, stand at the patient's head, grasp the arms just above the elbows, and draw the arms steadily upward above the head, keeping them stretched upward for two seconds. To expel the air from the lungs, turn down the arms and press them firmly for two seconds against the sides of the chest. Repeat these movements deliberately and persistently about 15 times a minute, until a natural effort to breathe is perceived, when the efforts should be turned toward inducing circulation and warmth, which can be best promoted by briskly rubbing the limbs upward with flannels, etc., thus propelling the blood along the veins to the heart, and by the application of hot flannels, hot water bottles, heated bricks, etc., to the pit of the stomach, between the thighs, the armpits, and to the soles.

Another method which has the advantage of simplicity and can be applied by one person is that of Dr. Benjamin Howard of New York. The body is placed face downward with a roll of clothing under the stomach, one arm being bent upward so that the hand supports the fore-

DROWSINESS — DRUG TRADE IN AMERICA

head. To expel the water from the chest, the body is pulled feet downward over the roll of clothing. Then turn the body on the back, with the roll of clothing under the shoulders, so that the head falls back, thus stretching the neck. Kneel over the body, one knee pressed firmly against either thigh. With both hands spread over the lower part of the chest, so that the thumb hooks in under the lowest ribs on each side, press forward steadily with the weight of the body on the arms, thus raising the ribs, enlarging the chest cavity, and causing the air to enter. When the ribs have been pushed upward to their utmost extent, release them gently by a receding movement, allowing them to return to their original position, thus expelling the air. Repeat this process until respiration is restored, then resort to the methods already mentioned to induce circulation and warmth. No attempts at resuscitation should be abandoned until all efforts seem to be absolutely futile. See **ASPHYXIA**.

Drowsiness. See **SLEEP**.

Droylsden, droilz'dĕn, England, town in Lancashire, just east of Manchester. It contains large cotton manufactories, copperas, chemical, and dye works, and print mills. Pop. (1901) 11,087.

Droz, François Xavier Joseph, frāñ swā ksāv-ē-ā zhō-zĕf drō, French moralist and historian: b. Besançon, France, 31 Oct. 1773; d. Paris 5 Nov. 1850. In 1806 he published 'An Essay on the Art of Being Happy,' which was very popular; and in 1823 'Moral Philosophy, or Different Systems of the Science of Life,' which procured his admission into the Academy. His reputation is, however, founded chiefly on his 'Histoire du Règne de Louis XVI.'

Droz, Gustave, French novelist: b. Paris 6 June 1832; d. 31 Oct. 1895. He was trained for a painter, but in 1864 gave up the pencil for the pen. The extraordinary success of his first volume of stories, 'Monsieur, Madame, and Baby,' justified the change. He excelled in little sketches of life and manners, and his lively, playful descriptions of bachelorhood and married life captivated the public. He has written: 'Sadnesses and Smiles' (1883); 'A Bunch of Letters'; 'At a Spring'; 'The Child'; etc.

Droz, Henri Louis Jacquet, ōñ-rĭ loo-e zhā-kā, Swiss mechanician: b. La Chaux de Fonds, Switzerland; d. Naples 18 Nov. 1791. He was a son of P. J. Droz (q.v.).

Droz, Pierre-Jacquet, pē-ār zhā-kā, Swiss mechanician: b. La Chaux de Fonds, Switzerland, 28 July 1721; d. Bienne, Switzerland, 28 Nov. 1790. Aspiring to be something more than a mere workman, he succeeded in attaching to common time-pieces, at a small expense, machinery which produced music resembling the chime of bells, and the music of a flute. His attempts to discover the means of effecting a perpetual motion led him to important discoveries. He contrived, among other things, a pendulum, which, being composed of two metals of unequal dilatibility, remained unaffected by heat or cold. He afterward made his celebrated writing automaton, which, by means of machinery contained within the figure, was made to move its fingers and hands, and to form handsome letters.

Drug, a name applied to all substances, vegetable, animal, or mineral, used for medicinal purposes, though the term should, perhaps, be strictly confined to what are called simples, balsams, gums, resins, and exotic products used as medicaments in a dry state. The name is also applied to dyeing materials and those used in tanning and other arts. See **PHARMACY**.

Drug Habits. See **CHLORAL**; **COCAINE**; **HASHISH**; **INTOXICATION**; **OPIUM**.

Drug Trade in America. Although the American drug trade is very much a matter of modern development America's part in the history of drugs dates from the days of the first explorers. When America was discovered, and travelers returned to the Old World bearing with them samples of the various products of this new world, the learned men of Europe hailed their coming with delight, and science affirmed without hesitation that the chief advantage that was to be derived from the discovery of the new continent would lie in the introduction of new and more powerful drugs. From that moment the scientists began to devote their attention to the study of American plants and herbs, and all the old chronicles devoted considerable space to the enumeration of the health-giving qualities of these products of American soil. There was nothing that grew in the New World that was neglected by the experimenters. Everything was tested, and many things were found that were of value. For a long time, for example, tobacco, Jesuits' bark, and sassafras, were among the most commonly used medicaments, and, from time to time, the medicinal properties of other herbs were discovered.

So far as the history of the drug trade itself is concerned, it has no such ancient record to which one may revert. A century ago the stock of every wholesale druggist included such articles of commerce as glassware, oils, paints, putty, indigo, madder, etc., and sometimes even more foreign commodities. Since the early part of the 19th century, however, the process of specialization has been at work so successfully that, little by little, the wholesaler has improved his commercial position by restricting his stock more generally to such articles as may be classified as true drugs or medicines. These articles, of course, include the many kinds of "patent" medicines, and will probably continue to do so as long as the demand for such preparations remains so great as to make them one of the most important items in the drug trade.

From the beginning of the history of medicine and pharmacy the people as a mass have been conspicuous for their faith in the efficacy of the "patent," or more properly, the secret, medicine. Quick to avail themselves of this popular confidence the makers of patent medicines have always flooded the market with their more or less efficient nostrums, depending upon the credulity of the people for their business success. Aside from these articles of commerce, however, the staples of the drug trade the legitimate drugs and medicines, were gathered from all quarters of the globe and widely distributed long before the discovery of America, but since the days of the explorers our contributions to this branch of commercial activity has been an important aid to the progress and development of the trade. Since the early days of the country's history, drugs, such

DRUG TRADE IN AMERICA

as jalap, ipecac, sarsaparilla, and balsams, have been imported from Mexico, as well as from Central and South America. As early as 1820, through the investigations of the French scientists, the separate alkaloids in cinchona bark were determined, and Pelletier soon began their manufacture. It was at about the same time that John Farr started the first quinine factory in Philadelphia, and the popularity of the drug was so immediate that John Currie soon followed by building a similar factory in New York.

In the early days the supplies of cinchona bark were imported from Spain, but the opening of the ports of South America to our commerce enabled us to secure the necessary shipments direct from those countries. In the beginning of the industry in America the Government placed a tax upon foreign-made quinine, and, as long as such duties remained in force, the American manufacturers had a practical monopoly of the home trade. In 1879, however, quinine was admitted to the free list, and, since that time, the foreign makers, who are able to produce the drug at a much lower cost than that at which we can make it, have not only shipped their surplus stock to this country, but have secured such a firm foothold that they now control nearly half of the American quinine market.

Stone-oil, or Seneca-oil, the substance which is now known as petroleum, was discovered in West Virginia, where it had long been popularly regarded as a most efficient liniment. It was found at several places in that State, where it rose to the surface of the ground, a heavy and dark substance, the true character of which was not discovered until many years later. In 1829, a similar supply was found in Cumberland County, Ky., and, upon a well being drilled, a phenomenal quantity of oil was unearthed. Owing to the fact that no ample provisions had been made to save the oil, the bulk of it was wasted. Some of it was preserved, however, and, having been bottled, was sold in Europe under the name of "American Oil." The device on the label, a derrick, first suggested the means by which a sufficient quantity of the crude oil could be obtained to pay the cost of refining it, a process which resulted in the discovery of such valuable filtered paraffine residuums as petrolatum, vaseline, etc., preparations which have since become important articles of export, their many useful qualities having been advertised by our citizens visiting or residing abroad.

It is believed that the first historical mention of the manufacture of drugs in this country may be found in the instructions given to Sir Francis Wyatt, governor of Virginia, in 1621. In this document he was requested to invite attention to the industrial possibilities to be found in the making of oil of walnuts, and he was authorized to employ such apothecaries as might be necessary to assure its proper production. The colonists were also requested to search for gums, dyes, or any new drugs. In 1785, the South Carolina Agricultural Society offered special premiums for the cultivation of such drugs as senna, cassia, hops, madder, rhubarb, and figs. It is useless to attempt to describe the various articles that were known to the drug trade of that day, or to enumerate the uses to which they were put, and, yet, in even so brief a review as this, a word or two must be said about the old-time business methods.

In the wholesale branch of the trade, some 60 years ago, the hours of business were from 7 o'clock in the morning until 9 o'clock at night. There were no railroads then, and means of communication between one part of the country and another were very primitive. After the Erie Canal was opened, the change in conditions brought about a corresponding change in business methods. Instead of dragging along through the year, the wholesale druggist had his two busy seasons. There was a rush of trade in the spring, and another rush just prior to the close of navigation in the fall, and clerks, at these times in the year, were often required to remain at work until midnight. Credit at this time was also a somewhat uncertain quantity. Selling terms were for six months, with 5 per cent off for cash, and interest was charged after the first six months. If the cotton crop failed in the South, collections from that part of the country were very slow, and, as the banking facilities of the nation improved, credits were shortened.

The outbreak of the Civil War had an effect upon the drug trade just as it had upon every branch of business in the North. Many large outstanding accounts were cancelled, and many houses, as the result, went out of business, although there were perhaps less failures in the wholesale drug line than in almost any other branch of business.

To realize what a great variety of articles were included in the stock of the wholesale druggists of the olden times, it is only necessary to peruse some of the advertisements which such houses published some 100 years ago, while the extent of the purely drug stock may be pretty accurately approximated by a comparison of one of the early pharmacopœias with the edition of 1890. The volume for 1830 is, perhaps, the best one to which we can refer to ascertain the condition of affairs which existed during the two or three decades prior to its issue. According to that authority there were 272 articles of materia medica, while 349 processes were given for preparations, making a total of but 621 titles. The "United States Pharmacopœia" for 1890 has no less than 994 titles, while the "National Formulary," a semi-official work of almost equal practical importance, has 435 more titles, making a total of 1,429 articles, or preparations, which the modern apothecary is supposed to be able to furnish a customer upon demand.

Of course, the wholesale druggist of 50 years ago, like his successor at the present day, was compelled to carry many articles which in respect were entitled to a place upon the pages of the pharmacopœias. In fact, this feature of the drug trade has so greatly extended during the past half century that reference to recent price-lists issued by the prominent jobbing houses shows that there are now more than 5,700 articles in the department of drugs, chemicals, oils, etc., and close upon 8,000 articles in the department of "patent," or proprietary medicines. Moreover, if one should go so far in his enumeration as to attempt to take all of the almost incalculable number of articles which come under the head of "druggists' sundries," to say nothing of the "secret proprietary" medicines with which the country is flooded, but which, being confined largely to local trade, do not appear upon any general price-list, there is little doubt that the figures already given would

DRUG TRADE IN AMERICA

be doubled; a fact which makes it seem very safe to estimate that there are no less than 25,000 articles that are handled by the drug trade of to-day.

So far as the retail druggist was concerned, his business, some 60 years ago, was largely a matter of "go as you please." In those days if he could prepare, from the crude material, the medicines required by the local physicians, he had succeeded in fulfilling the object of his existence. To-day, however, he enjoys most superior facilities, for while he is still required to be acquainted with all processes, he has the convenience, unknown to his predecessor, of being able to purchase the greater portion of his stock in such a stage of manufacture that it is practically ready for dispensing. To afford such facilities the business of manufacturing pharmacy has been developed, during the past 35 or 40 years, into a distinct department of the drug trade.

To present a comprehensive review of the drug trade of the United States it is necessary that some data should be given respecting the progress made in the development of the science of chemistry. Without laying any particular stress upon the wonderful improvements in inorganic chemistry, and especially in the remarkable work accomplished in the discovery and improvements of anesthetics, there can be no question but that the evolution of organic chemistry is one of the most stupendous scientific triumphs that has occurred since the middle of the 19th century. Wöhler's discovery, in 1828, that urea could be manufactured artificially from isocyanate of ammonium was really the first step that was even taken toward the synthetic production of organic compounds, for, up to that period, it had been the undisputed theory of the scientists that no organic compound was possible except through the medium of "vital force." Wöhler opened the way to further experiments along such lines, however, and, since 1828, innumerable compounds of an organic nature have been prepared synthetically, many of which are of such great commercial importance that they are manufactured in extensive quantities. Among such compounds, for example, is alizarine, the chief coloring principle of madder root, of which fully \$20,000,000 worth is produced annually. Oxalic acid, which formerly came from the juice of the sorrel, is now artificially produced, at one-tenth its former cost, by the use of sawdust and caustic soda; while salicylic acid, which was formerly derived from the oil of wintergreen, is now produced more easily through the action of carbon dioxide upon carbolic acid and caustic soda. Not only has the chemist succeeded in producing many of the most important organic compounds in his own laboratory, however, but, during the past quarter of a century, he has discovered a vast number of new and interesting synthetic chemicals which plants and animals have never produced, among them, antipyrine, exalgine, phenacetine, etc. Moreover, as the number of these compounds which are of importance therapeutically are constantly increasing, such progress as is represented by these discoveries in allied science has exerted a powerful influence in elevating the drug trade to the high position in which we find it to-day.

Of course, it must not be imagined that chemistry is the only agency that has been operative and effective in molding and shaping this development. One of the first in importance

among these agencies—first in importance in its influence upon the retail branch, and, through that, upon the wholesale trade—has unquestionably been the "United States Pharmacopœia." Up to the beginning of the 19th century, and even for some years thereafter, drugs were handled in a way that would have been far from reassuring to the invalid if he could have known of the true condition of affairs. In fact, it was not until some time between 1810 and 1820 that any attempt was made to better these conditions. The matter had been discussed, it is true, but it had always ended with the discussion. During this period, however, an authoritative agreement was made by all persons dealing in and prescribing drugs, fixing a standard regarding the identity and purity of the various medicinal agents then in use. In 1820, as the direct result of this agreement, the first edition of the "United States Pharmacopœia" appeared, and this work, which has passed through successive decennial revisions up to this time, is still regarded as the only standard in all the various manipulations of drugs and chemicals, from the identification of the crude material to the final stages in its proper preparation for the use of invalids. Although this great work was originally the result of purely scientific devotion, and has since remained distinctively a private enterprise, it has not only met with the support of the professional classes to which it directly appeals, but has also received such governmental recognition as to appear in the statutes of most of the States as the recognized authority in legally determining all questions relating to the purity of drugs sold, while the medical and pharmaceutical professions of every civilized country have accorded the work their full endorsement as an authoritative contribution to the literature of applied science.

The governmental inspection of imported drugs, which commenced about 1825, was largely the result of the initiative taken by the newly-established pharmaceutical colleges in New York and Philadelphia. This work of inspection, which is still conducted by the national officials, has had an important effect in upholding the standard of purity in drug imports.

The first law regulating the retail sale of drugs and poisons that was ever passed in the United States was enacted by the State Legislature of Rhode Island, in 1870, but, since that time almost every State in the Union has placed a similar act upon its statutes. While there is a woeful lack of uniformity in these laws, in general they cover the same ground by restricting all dealings in drugs, as well as all compounding of prescriptions to such persons as have been able to present satisfactory evidence of their qualification to the board which is legally authorized to license those whom it may deem capable of engaging in such a business. As such laws were not retroactive their beneficial effect has been only partially determined, as those who were engaged in the drug business prior to the passage of these acts were allowed to continue regardless of their ability to pass an examination.

Another agency that has accomplished important results in the betterment of the drug trade are the various associations that have been founded since the middle of the 19th century. The first association instituted for the conservation and advancement of the material and pro-

DRUG TRADE IN AMERICA

professional interests of the business was the American Pharmaceutical Association, which was founded by 21 active pharmacists in 1852. This association, which holds annual meetings for the discussion of scientific and educational questions, and other matters relating to the welfare of the trade, now has a membership of fully 2,000, and one of the effective features of its work is the annual publication of its proceedings, a work which presents a complete review of the scientific progress of pharmacy. One of the most important influences exerted over the retail trade is represented by the various State pharmaceutical associations, the oldest of which, that of New Jersey, was organized in 1870, while one of the most notable events in the history of the wholesale drug trade during the 19th century was the organization of the wholesale houses of the West under the name of the Western Wholesale Druggists' Association. It was founded in 1876, and was called into existence by the peculiar conditions of the times. The expansion which had followed the unsettled conditions during the Civil War was itself followed by a collapse and a general unsettling of all trade relations. To secure trade, and, afterward, to hold it, required the sharpest of competition, a competition that finally became so sharp that concerns which had hitherto been regarded as prosperous houses found themselves in a position in which it was impossible to make profits. As the result a committee was appointed to try to introduce a system that is now known as the "rebate plan." According to the old system such articles as patent medicines had been sold on a very close margin, and the new plan was devised to give the wholesale druggists an opportunity to obtain a fair profit upon such preparations. By the adoption of the "rebate plan," therefore, the wholesale druggists consented to sign a contract by which they agreed to maintain established prices, on condition that they were to receive 10 per cent reduction, or rebate, upon the regular wholesale price, and with the penalty of being placed upon the "cut-off" list, and thus debarred from buying from the proprietors, in case they were guilty of violating their agreement. In 1882, many of the prominent Eastern druggists joined forces with the Western wholesalers, at a meeting held at Cleveland, Ohio, and, at this time, the name of the organization was changed to the National Wholesale Druggists' Association. At the next annual meeting, which was held in New York, committees were appointed to keep in touch with and report annually upon such matters of trade interest as fire insurance, the national bankruptcy law, legislation, credits, rebates, etc., a work which has since proved of the utmost importance to the trade. Up to this time, there had been scarcely more than a dozen large distributing centres in the United States, while, at the present time, under the working of the rebate system, almost every town of 50,000, or more inhabitants, in the country has one or more wholesale drug establishments, which, owing to the fact that they are now placed on an equal footing with the largest of buyers, are able to supply the needs of the retail druggists in their neighborhood.

Still another important factor in the growth and development of the drug trade is the American pharmaceutical press. Among the most prominent periodicals are such weekly papers as

the "Pharmaceutical Era," the "Shipping and Commercial List," and the "Oil, Paint, and Drug Reporter," all of New York; semi-monthlies like the "American Druggist and Pharmaceutical Record," of New York, and such monthly journals as the "American Journal of Pharmacy," of Philadelphia; the "Druggists' Circular and Chemical Gazette," of New York; "Pharmaceutische Rundschau," of New York; the "Western Druggist," of Chicago the "National Druggist," of St. Louis, and the "New England Druggist," of Boston. Besides these there are some smaller periodicals of local influence, as well as a considerable number of publications issued by the various colleges and societies, and by prominent drug firms and manufacturing houses. All these journals agree in their general purpose in that they strive to present a record of current scientific investigations and progress, and to bring the members of the drug trade into closer touch and sympathy.

There is, perhaps, no particular in which the development of the drug trade is indicated more clearly than in the improvements in its methods. Less than a century ago the apothecary was obliged to cut and roll his pills by hand, and to make his plasters with a "spreading iron." To-day such operations are performed by machinery, a process which has so simplified the work that the manufacturing pharmacist is now able, by the use of his power-machine, to turn out more than 100,000 pills a day, and plasters almost *ad libitum*. The power-machines which are used in the making of compressed tablets now make more than 500 tablets a minute. The ever-popular seidlitz powders are mixed, measured, and put up in packages, all by machinery, and bottles are filled, corked, and labeled by similar means, while the marvelous progress in operative pharmacy, and the benefit derived by the drug trade by such exhibitions of inventive skill, are shown by the fact that the combined ratings of 270 wholesale druggists and manufacturers of chemicals and pharmaceuticals is nearly \$50,000,000. Of these, 11 are rated at \$1,000,000 each; some 30 up to \$500,000 each; and 37 at \$250,000 each. There are eight large factories engaged in the manufacture of fine chemicals, and more than a dozen firms that are employed in manufacturing pills and other pharmaceutical preparations on an extensive scale.

The making of fluid extracts as a class of pharmaceutical preparations is essentially an American invention. They are made by percolation, or displacement, a process by which the powdered drug, placed in a suitable vessel, is deprived of its soluble constituents, by the descent of a solvent through it, an invention the importance of which cannot be overestimated, as much of the progress in American pharmacy during the last half of the 19th century was largely due to the study and development of the process of percolation, and the introduction of preparations which owed their existence directly to this invention. Percolation received the stamp of official recognition in the "Pharmacopœia" of 1840, and has occupied a place in all subsequent editions of that work. None of the editions of the "Pharmacopœia," prior to that of 1850, gave any formulas for the preparation of fluid extracts. In 1850, seven of these formulas were given and by 1890 the number had been increased to 88, although this number does not begin to represent the total

DRUG TRADE IN AMERICA

manufacture of fluid extracts, which have now become almost as numerous and as popular as the vegetable drugs.

Another innovation are the so-called "elixirs," which were originated sometime in the later thirties. For a time this term was used almost exclusively by manufacturers to designate their aromatic, sweetened, spirituous preparations which contained comparatively small quantities of active medicinal substances, but no formula under that name was published for the use of druggists until 1859.

There are few branches of industry in which the American inventive genius has found a wider field for the creation of labor-saving devices than that which has been offered by the manufacturing pharmacist. Less than a century ago there was practically no machinery adapted to the making of pharmaceutical preparations. Every pharmacist owned an old-fashioned stone or iron mortar in which he powdered his drugs, for drug-milling was an unknown process. Now the old iron or stone mills have been superseded by newly invented machinery which has not only cheapened the cost of production, but which has vastly improved the quality of the product. Of these inventions, one of the most important innovations is the process of grinding by attrition, a process by which a system of rapidly revolving arms in a cylinder quickly reduce such substances as may be introduced to any degree of fineness that may be desired. When substances are more friable, the rumbler, a revolving cylinder inside of which are a system of porcelain balls, may be resorted to, while centrifugals have also effected great changes in the production of chemicals, and percolators have taken the place of the wide-mouthed jar and the "stirring-stick."

The first sugar-coated pills ever made in this country were manufactured by the Tilden Company, of New Lebanon, N. Y., while the use of gelatine capsules as a means of administering nauseous remedies in a readily assimilable condition was also the direct result of American enterprise. This process was originally outlined by Mothes, of Paris, but the success in popularizing it was due to the efforts of H. Planten & Son, the firm which first made them in the United States. General as the use of such capsules had been, another strong impetus was given to this branch of the trade, during the early seventies, when the improved machinery for their manufacture was invented.

It is difficult for us to-day to realize that it has been only since the first quarter of the 19th century that science has had anything like a correct conception of the nature and agencies of the digestive secretions. Prior to that time the most absurd theories were advanced to account for the process of digestion in the stomach, and it was not until after 1825, when the American surgeon, Beaumont, made his carefully conducted observations upon the phenomena of digestion in the living stomach, that the functions of the gastric juice were revealed. His investigations, which lasted until 1833, were most important in that they stimulated and suggested the course for subsequent researches, and, in 1836, when the active principle of the gastric juice was discovered by Schwann, he gave it the name of "pepsin." From a commercial point of view pepsin and the other digestive ferments have attained their greatest degree of importance in the United States, for it is in

America that their value and practical usefulness as therapeutic agents and in the artificial digestion of foods has been most thoroughly developed. From a commercial point of view, the history of pepsin in America begins with the introduction of Scheffer's pepsin, in 1872. This preparation was made by a simple and practical method known as the "salt" process, and it was a great improvement over all of the older methods of obtaining the ferment from the stomach. A few years later, about 1879, the original form of pepsin in scales, "free from added substances or reagents," was introduced by Fairchild, and the advent of this preparation of phenomenal strength, coming at a time when the fallacy of administering the ferment in largely diluted form had begun to be recognized, had the effect of causing great activity in the manufacture and improvement of the commercial pepsins. The practical recognition and application of pancreas ferments is due to the efforts of Fairchild, who, in 1880, introduced the *extractum pancreatis*, containing diastase for the conversion of starch, trypsin for the conversion of albumen, and emulsifying ferment for the digestion of fats, and the milk-curdling ferment, a preparation which proved to be of great utility, especially in the artificial digestion of foods for the sick. Both diastase and trypsin have since been extensively used in the preparation of foods for infants. Basing his theories upon the indigestibility of starch, Liebig proposed that the farinaceous foods which were commonly used with milk as food for infants should first be digested into soluble form by the use of malt diastase, while, in 1884, Fairchild proposed a method by which cows' milk might be modified and adjusted to a closer resemblance to human milk by the conversion of casein, by the use of trypsin, to the soluble and peptone-like bodies for which the latter milk is peculiar. Pepsin now appears in a great number of forms that are both popular and official, and the digestive ferments in general have not only attained a most important position in modern therapeutics, but the progress of physiological chemistry now suggests still greater utilization of the animal organic principles in the treatment of disease by the thyroid gland.

The first improvement upon the antiquated method of applying plasters to the human body was the invention of an india-rubber porous plaster by Dr. Shecut, a naval surgeon. He sold his rights in the plaster to Thomas Allcock, and the latter, failing to make its manufacture profitable, sold it to Dr. Brandreth. At that time the only commercial plasters were made of isinglass and resinous mixtures, some of which were spread on cloth and plaster skins. It was about 1867 that Seabury & Porter began the experiments which finally resulted in the use of rubber in medicinal and surgical plasters.

It was in 1878 that Dr. R. M. Fuller, of New York, introduced another distinctively American form of medication under the name of "tablet triturates." These were made by a method in which the active ingredient was triturated, or ground, with either plain sugar of milk, or with a mixture of sugar and milk and cane-sugar, into a paste which was pressed into tablets in suitable molds. By this process it was possible to administer small quantities of such potent remedies as alkaloids, concentrations, etc., in a convenient, palatable, and readily soluble form.

DRUGGET — DRUID

Unique as the idea was, it immediately became so popular with the medical profession that the manufacturers began to produce them upon an enormous scale, one manufacturer alone having no less than 500 different varieties of these tablets on his price-list.

Great as have been the developments along individual lines, however, it is only by reference to the actual statistics that we can gain any idea of the magnitude of the commerce to which the modern drug trade has attained. Of course, so far as the early history of the trade is concerned we have nothing like any accurate statistics to guide us. The trade organizations which have been in existence since the middle of the 19th century have been sufficiently interested in the subject to give some attention to the compilation of figures concerning its growth and development, but, prior to that time we have no better record than that of tradition. The United States government kept no record of the imports and exports in drugs until 1830, and even then the list was confined to a few items. In 1830, the exports from the United States were stated to be \$130,238, while in 1835, they were reported as being about \$200,000. Seventy years later, at the close of the year 1904, the exportation of such products amounted to an aggregate of nearly \$14,500,000. So far, South and Central America, Canada, Mexico, and the West Indies, have been our chief fields of export. Except for a few specialties, Europe has taken our simples only. Tobacco, which was probably the first indigenous drug imported, is now so widely consumed that it is considered of sufficient importance to have a classification of its own in the export list.

Although we are still large importers of drugs, there is reason to believe that they will continue to be reduced as the natural resources of this country are developed. With a climate which ranges from frigid to torrid, there seems to be little reason why it should not furnish nearly all requisite products of the vegetable world, at least, if proper care is taken in propagating and developing them. Borax, which is now of considerable importance as a domestic product, was formerly entirely an item of import. The supply came from England, or indirectly from Italy. In 1856, it was discovered in California. A few years later it was found in the deserts of Nevada, and the home supply is now sufficient to meet all demands of the country. Borax, however, is by no means the only example that might be cited. There are many others, especially among the materials which enter into the inorganic compounds that are easily accessible in the United States. Among them one may mention quicksilver, iron, lead, copper, zinc, aluminum, lime, sulphur, potash, soda, gold, silver, manganese, etc. while the experiments with camphor, cork, licorice, olives opium, and other foreign plants have been sufficiently successful to demonstrate the fact that a great variety of the medicinal vegetables may be cultivated in American soil.

Unfortunately there is no data from which we may estimate the number of druggists doing business in the United States at the beginning of the 19th century. The New York directory for 1786 mentions the names of only five. One druggist, Effingham Lawrence, was official apothecary to the Medical Society, a committee from which visited his store once every three

months to certify that his drugs were genuine and his medicines properly prepared. Among the wholesale drug houses now in business in New York, two were established more than a century ago, although only one, the firm of Schieffelin & Company, has retained its original name. This house was established by Jacob Schieffelin, in 1794, and is still under the control of his descendants. The firm of Powers & Weightman, of Philadelphia, began business under the name of Farr & Kunzi, in 1818, while the first drug store in Washington was opened by Frederick Miller in 1796. The oldest drug house in the West is probably that of T. H. Hinchman & Sons, of Detroit, Mich. The earliest wholesale druggists in Chicago were Dr. Clark, Dr. Brinkenhoff — now Peter Van Schaack & Sons,—and Dr. John Sears, while among the other wholesale houses doing business in New York nearly three-quarters of a century ago one may mention the firms of Lawrence & Keese, J. A. & W. B. Post, Thomas S. Clark, John & William Penfold, John M. Bradhurst, R. & S. Murray, Silas Carle, Olcott & McKesson, and John C. Morrison. Among the manufacturers of medicinal chemicals the following firms are worthy of mention: Rosengarten & Son, of Philadelphia; Charles Cooper & Company, of New York; Charles Pfizer & Company, of New York; Mallinckrodt Chemical Works, of St. Louis; Larkin & Scheffer, of St. Louis; Herf & Frerichs Chemical Company, of St. Louis, and the New York Quinine and Chemical Works.

One of the pioneers in the manufacture of pharmaceutical preparations was Dr. E. R. Squibb, a past assistant surgeon in the United States Navy, who organized and ran the United States Naval Laboratory from 1854 until 1858, when he started the present manufacturing business. Among the other pioneer manufacturers are the Tilden Company, of New Lebanon, N. Y.; Billings, Clapp & Company, and the E. L. Patch Company, of Boston; Sharp & Dohme, and the Burroughs Brothers Manufacturing Company, of Baltimore; Henry Thayer & Company, of Cambridgeport, Mass.; William R. Warner & Company, John Wyeth & Brother, and the H. K. Mulford Company, of Philadelphia; Parke, Davis & Company, and Frederick Stearns & Company, of Detroit, Mich.; the William S. Merrill Chemical Company, of Cincinnati; Eli Lilly & Company, of Indianapolis, and Charles S. Baker & Company, and the Searle & Hereth Company, of Chicago. The pioneer manufacturer of druggists' balances, or fine scales, was Henry Troemner, who came to this country from Marburg, Germany, in 1836, and, two years later, started business in Philadelphia. Prior to this time the scales which were required by druggists had been made to order by jewelers.

Drugget, a coarse and flimsy texture originally half silk and half wool, chiefly used for covering carpets. It was formerly extensively employed as an article of clothing by the poorer classes, more especially of females; but this and similar fabrics are now almost wholly superseded by cotton goods, which induce greater cleanliness, and are less liable to retain infectious and contagious poisons.

Druid, a member of the Celtic priesthood of ancient Britain and Gaul, which at the period of the Roman invasion, existed chiefly

DRUID STONES—DRUM

in Brittany, and along the valley of the Loire; and in the island of Anglesey, in Wales, and in Ireland. Scattered throughout these regions, at Carnac in Brittany, at Stonehenge and Avebury in England, and numerous other localities, are the stupendous stone structures, known as cromlechs, menhirs, dolmens, kistvæns, etc., ascribed by the older archæologists to the druidical cult, and still popularly known as druidical temples and altars, but now assigned by scientists to prehistoric palæolithic and neolithic predecessors, although it is probable these megalithic monuments were used by the Druids in their mystic rites to impress the populace. Welsh tradition relates that the Druids entered Gaul from the Orient with the Celtic Kymric race, and their religious practices have been variously described as of Hindu, Persian, and Egyptian origin. Accurate knowledge of the sect is limited owing to their inviolable practice of not allowing their history to be written, all their lore being committed to memory, and all instruction being imparted orally. The best ancient and contemporary account of the Druids is that by Julius Cæsar, who thus describes them: "They attend to divine worship, perform public and private sacrifices, and expound matters of religion. A great number of youths are gathered round them for the sake of education, and they enjoy the highest honor in that nation; for nearly all public and private quarrels come under their jurisdiction; and when any crime has been committed, when a murder has been perpetrated, when a controversy arises about a legacy or about landmarks, they are the judges, too. They fix rewards and punishments; and should any one, whether a private individual or a public man, disobey their decrees, then they exclude him from the sacrifices. This is with them the severest punishment. The persons who are thus laid under interdict are regarded as impious and wicked people; everybody recoils from them, and shuns their society and conversation, lest he should be injured by associating with them. They cannot obtain legal redress when they ask for it, nor are they admitted to any honorable office. All these Druids have one chief, who enjoys the highest authority among them. When he dies, he is succeeded by the member of the order who is most prominent among the others, if there be any such single individual; if, however, there are several men equally distinguished, the successor is elected by the Druids. Sometimes they even go to war about this supremacy. At a certain time of the year, the Druids assemble on the territory of the Carnutes, which is believed to be the centre of all Gaul, in a sacred place. To that spot are gathered from everywhere all persons that have quarrels, and they abide by their judgments and decrees. It is believed that this institution was founded in Britannia, and thence transplanted into Gaul. Even nowadays, those who wish to become more intimately acquainted with the institution generally go to Britannia for instruction's sake.

"The Druids take no part in warfare; nor do they pay taxes like the rest of the people; they are exempt from military service, and from all public burdens. Attracted by such rewards, many come to be instructed by their own choice, while others are sent by their parents. They are reported to learn in the school a great number of verses, so that some remain there 20

years. They think it is an unhallowed thing to commit their lore to writing, though in the other public and private affairs of life they frequently make use of the Greek alphabet. . . . Beyond all things, they are desirous to inspire a belief that men's souls do not perish, but transmigrate after death from one individual to another; and they hold that people are thereby most strongly urged to bravery, as the fear of death is thus destroyed."

Besides being priests and teachers of religion the Druids appear also to have been adept astrologers and magicians, and were versed in the mysterious powers of animals and plants; the oak-tree, the mistletoe when growing on the oak, the vervain, the hyssop, and marshwort were held in especial reverence among them, and like the Romans, they drew auguries and prophecies from an inspection of the entrails of sacrificed animals, and from the flight of birds; their mysterious rites were usually performed in the depths of oak forests. The order was divided into three classes: vates or prophets, bards, and priests; with them were associated, but without sharing their prerogatives, three classes of prophetesses or sorceresses.

Before the advent of the Romans the autocratic powers of the priesthood aroused the antagonism of the warrior element of the tribes, and according to Cæsar, the latter had deprived them of much of their political power. The Druids exerted all their powers to oppose the Roman conquerors, and continually incited the people to rebellion, until they were driven out of Brittany into Wales, and finally gathered in the island of Anglesey, where they were attacked by Suetonius Paulinus in 61 A.D., and in 78 A.D. were utterly subdued and almost exterminated by Agricola.

Druid Stones, a name given in England and other parts of the country to weather-worn, rough pillars of gray sandstone which are scattered over the surface of the chalk-downs in England, in Scotland, and its islands, and which exist in great numbers in other countries; generally in the form of circles, or in detached pillars; it is not certain, however, that the Druids had any connection with these stones. See GRAYWETHER.

Druids, United Ancient Order of, a secret society springing from a club organized in London 1871, solely for the entertainments of its members. The popularity of the club soon led to the formation of a distinct order and provided with a ritual for initiations and a form of government founded on traditions said to have been preserved from the ancient Druids. There are now two independent bodies, the Ancient Order of Druids and the Order of Druids of England. The order was instituted in New York in 1833. In 1900 the order in the United States reported 16 grand groves, 395 subordinate groves, 16,782 members, and \$4,536,701 disbursed in benefits since 1847; benefits disbursed during last fiscal year \$214,034.

Drum, a musical instrument formed by stretching parchment animal skin over the heads of a cylinder of wood or over a bowl-shaped metallic vessel. There are three kinds of drums: (1) The long drum or bass drum with two heads, held laterally and played on both ends with stuffed-knob drumsticks; (2) the side-drum, having two heads, the upper one

DRUM — DRUMMOND

only being played on by two sticks of wood; the lower head has occasionally strings of catgut stretched across its surface, and then it is called a snare drum; (3) the kettle-drum always employed in pairs. Of these (1) is the ordinary drum used by an infantry or marching band. It is employed mainly to mark the time, and also to increase the fortes. The big drum, ~ *grosse caisse*, of the modern orchestra, is a modification of the ordinary drum, with the diameter greatly increased, and the length of the cylinder lessened. It is struck on one side only. (2) Is the side-drum of the fife and drum bands. It is occasionally employed in the orchestra for special effects. (3) Are either the small kettle-drums of the cavalry band, played on horseback; or the proper orchestral drums, larger in size, but similar in construction. They are generally tuned to the tonic and dominant of the composition in which they are used, but this rule is not without exceptions. The tambourine is a species of drum, consisting of a single skin on a frame or vessel open at bottom. The heads are tightened by cords and braces, or by rods and screws.

The drum was a martial instrument among the ancient Egyptians, as the sculptures of Thebes testify. Their long drum was like the Indian tam-tam, and was beaten by the hand. It was about 18 inches long, had a case of wood or metal, and heads of prepared skin, resembling parchment. These were braced by cords in a manner somewhat similar to the modern. The instrument was carried by a belt, and was slung behind the back on a march. The invention of the drum is ascribed to Bacchus, who, according to Polygenus, gave his signal of battle by cymbal and drum. It was, however, known in very early ages, and in some form or other among almost all nations.

Drum, a Celtic word common in Ireland and Scotland, signifying a knoll, ridge, or small hill, frequently found alone as the name of a village, farm, estate, etc., and often also as a prefix, as in Drumalbin, Drumderg, Drumlanrig, Drummoissie, etc. Irish geologists give the name to all elevations.

Drumclog, Scotland, a place in Lanarkshire, on the borders of Ayrshire, 16 miles southeast of Glasgow. In 1675 Drumclog was the scene of a battle in which the Covenanters defeated the Royalists. The battle is described in Scott's 'Old Mortality.' A monument marks the scene of the encounter.

Drumfish, or **Drum**, certain fishes of the family *Sciaenidae* (q.v.), so-called from the resonant sound which they produce in the water by forcing gas through the air-bladder. In the United States the name is especially applied to the following. The common drumfish (*Pogonias chromis*) which has a short stout body, numerous barbels on the lower jaw, and large pavement-like teeth on the pharyngeal bones. It is one of the largest of food fishes, though the flesh is not highly valued. The drumfish is common on sandy shores south of Long Island and is caught on lines thrown into the surf. By means of its powerful dentition the shells of the stoutest mollusks and crustaceans are crushed and their contents devoured. At times schools of drumfish create great havoc on oyster beds. The red drum or red-fish (*Sciaenops ocellatus*) is a smaller fish, weighing from 10 to 75 pounds,

and distinguished by the separate lower pharyngeal bones, the absence of mandibular barbels, and the eye-like spot at the base of the tail. It is one of the most important game and food fishes of the southern United States, especially in Texas. The black drum (*Sciaena deliciosa*) is a closely allied dusky bluish species found in the warmer parts of the Pacific coasts of America. The fresh-water drum or sheepshead (*Aplodinotus grunniens*) is closely related to the common marine drumfish, from which it differs in the absence of barbels. It ranges from the Great Lakes, where its flesh is coarse and rank and of little value for food, to Texas, where it becomes a fine-flavored and important food fish. It sometimes exceeds 50 pounds in weight.

Drum'goole, John Christopher, American clergyman: b. Longford County, Ireland, 1828; d. New York, 28 March 1888. He was ordained a Roman Catholic priest in the United States, and in 1871 began an organized mission in New York for homeless boys. The work grew under his charge and he built in New York a home called the "Mission of the Immaculate Virgin," and established an industrial farm of over 600 acres on Long Island, all in the interest of homeless boys.

Drumlin, a smoothly rounded oval hill of boulder clay, or till, formed beneath the great ice sheets of the glacial period. Drumlins are most frequently found near what was the front of the ice sheet, and, by their peculiar form, are easily recognized. They are usually over half a mile long and from 100 to 200 feet high. Drumlins are of common occurrence in Massachusetts, particularly about Boston harbor, where some form islands. They are also abundant in western New York and in southern Wisconsin. Their method of formation is uncertain, though they plainly represent material gathered beneath the ice sheet and in some way piled up by it. See **DRIFT**; **GLACIAL PERIOD**.

Drummer, one of the members of a regiment whose office it is to beat the drum, to mark time for military exercises and marching. In all the branches of the army service he receives slightly more pay than a common soldier. The drummers of a regiment are under the control of the sergeant-drummer. Also, in the United States, the name is applied to a traveling salesman or one who solicits trade going from one town to another.

Drummond, Sir George Gordon, English soldier: b. 1771; d. 1854. He entered the British army as ensign in 1789; was staff-officer at Jamaica several years; on duty in Canada 1808-11, and promoted lieutenant-general 1811. He was again ordered to Canada as second in command under Sir George Prevost 1813; planned and effected the capture of Fort Niagara; planned the successful attack on Black Rock and Buffalo; led a combined military and naval force against Oswego and destroyed the American works and stores, May 1814. He was in command of the British forces at the battle of Lundy's Lane 25 July, and in August invested, but failed to capture, Fort Erie. In 1815 he was appointed governor-general of Canada.

Drummond, Henry, Scottish geologist and religious writer: b. near Stirling 17 Aug. 1851; d. Tunbridge Wells 11 March 1897. He was educated at the universities of Edinburgh

DRUMMOND — DRUNKENNESS

and Tübingen; entered the ministry of the Free Church, and having devoted much attention to science, was in 1877 appointed lecturer on natural science in the Free Church College, Glasgow, being made professor in 1884. One of his most popular books was 'Tropical Africa' (1888), giving his own experiences in that part of the world. His most remarkable work, and the one by which his name became most widely known, is 'Natural Law in the Spiritual World' (1883), which has passed through many editions and been translated into various languages. This work was written with the object of showing that such scientific doctrines and theories as those associated with the name of Darwin and his followers were not incompatible with revealed religion. He was author also of 'Travel Sketches in Our New Protectorate' (1890); 'Pax Vobiscum' (1890); 'The Programme of Christianity' (1892); 'The Greatest Thing in the World'; 'The Ascent of Man' (1894). The last-named work is a semi-popular review of evolution theories which caused some controversy on its first appearance, mainly on account of its author's insistence on the recognition of altruism, or "the struggle for the life of others," as the most important factor in organic and especially in social evolution. His facile and fervid style of composition suited the tastes of large numbers of readers. See 'Life' by G. A. Smith (1898).

Drummond, James, English Unitarian theologian: b. Dublin, Ireland, 14 May 1853. He was educated at Trinity College, Dublin, entered the Unitarian ministry and was colleague of Rev. William Gaskell (q.v.) at Cross St. Chapel, Manchester, 1859-69. He became professor of theology at Manchester New College in 1869, succeeding Rev. James Martineau (q.v.) as its principal in 1885, and removing with the college to Oxford in 1889. He has published 'Spiritual Religion: Sermons on Christian Life and Faith' (1870); 'The Jewish Messiah: a Critical History of the Messianic Idea Among the Jews' (1877); 'Introduction to the Study of Theology' (1884); 'Philo-Judæus: or the Jewish-Alexandrian Philosophy in its Development and Completion' (1888); 'Via, Veritas, Vita' (1894); 'The Pauline Benediction' (1897); 'International Hand-books to the New Testament' (ed. by Orello Cone); 'The Epistles of Paul the Apostle to the Thessalonians' (1899); 'Life and Letters of Dr. Martineau' (with Upton) (1902).

Drummond, Thomas, Scottish inventor: b. Edinburgh October 1797; d. Dublin 15 April 1840. He went to Woolwich to receive special instruction in the duties of an engineer, and while pursuing his studies showed his inventive talent by devising a form of pontoon which recommended itself by its facility of transport as well as by its admirable adaptation to the immediate purpose for which it was intended. Having heard the incandescence of lime mentioned in a lecture, it struck him that the light produced by this incandescence might be advantageously applied to replace the Argand-lamps which were used in the surveys, and after devoting a good deal of attention to the subject, he found a means of effecting the desired object. (See CALCIUM LIGHT.) On the first occasion on which the light was employed, in the Irish survey, it showed the position of a station 66

miles distant. While on the same survey he invented a heliostat which has always been employed since in land-surveying, and with the aid of which observations can be taken at distances exceeding 100 miles. In 1835 he was appointed under secretary for Ireland, and in 1836 was chairman of a commission on railways in Ireland, and gave in a very valuable report of the proceedings of the commission. His services to Ireland were recognized by the erection of a statue by public subscription.

Drummond, William, of Hawthornden, Scottish poet: b. Hawthornden House, near Edinburgh, 13 Dec. 1585; d. there 4 Dec. 1649. He was educated at the University of Edinburgh and, retiring to his romantic seat of Hawthornden, gave himself up to the cultivation of poetry and polite literature. A dangerous illness fostered a serious and devout turn of mind, which was evinced by his first productions, 'The Cypress Grove,' in prose, containing reflections upon death; and 'Flowers of Sion, or Spiritual Poems.' He entertained Ben Jonson at Hawthornden for three weeks on the occasion of a visit which the English dramatist made to Scotland in the winter of 1618-19. To this visit a great deal of interest is attached from the fact that Drummond took notes of the conversations held with Ben Jonson, which were afterward published, though not till long after the death of both. They first appeared in the folio edition of Drummond's works in 1711. These notes were republished separately by the Shakespeare Society in 1842. As a historian, Drummond is chiefly remarkable for an ornate style, and a strong attachment to the High Church principles of the Jacobites. His 'History of the Reigns of the Five Jameses' was published several years after his death. He is now remembered only as a poet. Although tinged with the conceits of the Italian school, there is much genuine imagery and truth of feeling in all his poetry, but particularly in his sonnets, which are replete with tenderness and delicacy. See his 'Poems,' edited with memoir, by Ward (1894); 'Life,' by Mason (1873).

Drummond Island, the extreme west of the Manitoulin chain, in Lake Huron, belongs to Chippewa County, Mich. It measures 20 by 10 miles.

Drummond Light. See CALCIUM LIGHT.

Drunkenness, in law, is not considered an absolute defense, although in some cases, depending on the nature of the act, and to what extent the person was under the influence of intoxicating drinks, the offense, when committed by a drunken man, is changed to one of less severity. The general rule is, that if a person voluntarily, by the use of intoxicating liquors, deprives himself of his reason, he cannot offer it as a defense for acts which he commits while intoxicated. If the intoxication is carried to such an extent as to be a disease, such as delirium tremens, or *mania à potu*, a different question is raised, and, in the first case, it will reduce the offense and in the second case there are some decisions which go so far as to hold that it is a complete defense.

The general rule is that contracts made by a person under the influence of liquor are voidable and not void; so that if a person while intoxicated makes a contract under which some inno-

DRUPE—DRUSES

cent third person, for value, acquires rights, the contract is binding on the person making it; although he was under the influence of liquor at that time. If a person makes a contract when so far under the influence of liquor as to be deprived of his senses, and the contract is so one-sided as to be unreasonable, the question of fraud may enter into the transaction. In cases where a person is tried for murder in the first degree, to prove that crime the evidence must show, according to the statute defining murder in the first degree, malice aforethought. Now it has been held that an excessive intoxication excludes the malice and only passion is shown and the crime is reduced below murder in the first degree. But the person accused must prove intoxication to such an extent that passion and not malice will be shown. Although if a person, while sober, makes all preparation to take a person's life, and then, before committing the crime, becomes intoxicated, doing an act when intoxicated which he was afraid to do when sober, it would be murder in the first degree. In cases of robbery, it is presumed the goods are taken with a felonious intent, but if the accused can prove sufficient intoxication, the felonious taking is not presumed. When a person is tried for an act and the defense is provocation, the amount of provocation to make a good defense would be less, when the person who gave the provocation was intoxicated than if he was sober and in his right senses.

Drupe, in botany, a simple, succulent stone-fruit composed of a single monospermous carpel, of which the carpellary leaf becomes fleshy at its external division, and ligneous in its internal division, as in the peach, cherry, plum, olive, etc. The stone which encloses the kernel is the endocarp; the pulpy, or succulent part, the mesocarp. In the horse-chestnut and coconut, the mesocarp is not succulent, and in the date the endocarp is replaced by a membrane.

Drury, Arthur, English sculptor: b. London. His art education was obtained at the National Art Training School, South Kensington, and in Paris under Dalou. His principal works are 'The Triumph of Silenus' (1885); 'Circe' (1893); 'St. Agnes' (1894); 'The Age of Innocence' (1897).

Drury, Dru, English silversmith: b. 4 Feb. 1725; d. 15 Dec. 1803. He was devoted to the study of entomology and to collecting exotic insects, and published 'Illustrations of Natural History' (1770-82), with upwards of 240 figures of exotic insects. His 'Illustrations of Exotic Entomology' was edited in 1837 by Westwood, and appeared with nearly 700 figures by Moses Harris.

Drury College, a coeducational institution in Springfield, Mo.: founded in 1873 under the auspices of the Congregational Church. In 1902 the college had 20 professors and instructors, and nearly 350 students. The library contained about 30,000 volumes.

Drury Lane Theatre, a famous place of amusement in London, located in Russell Street, near Drury Lane. It was first opened in 1663, and was rebuilt by Sir Christopher Wren and reopened in 1674. It was again rebuilt in 1704. The present edifice was opened in 1812, with a prologue by Lord Byron, the advertisement for

which gave rise to the famous 'Rejected Addresses.' Garrick opened the theatre in 1747 with Dr. Johnson's prologue; and most of the great English actors have trod the boards which are now given over for the most part to pantomimes and spectacular pieces.

Druses, a people of Syria, scattered over an extensive tract of country lying to the south-east of Beirut, and south of the country occupied by the Maronites; or, more particularly, they occupy the southern parts of Lebanon and Anti-Lebanon (the slopes of Hermon), while considerable numbers also inhabit the Hauran (south of Damascus), where the mountainous tract occupied by them is now often designated the Druse Mountain. The total Druse population is estimated at from 75,000 to 85,000. In the northern districts occupied by them they are mingled with the Maronites, but many towns and villages are peopled almost exclusively by the Druses. There are some circumstances which tend to show that the Druses are not indigenous to the territory they now possess, although they have long since dropped their own language and adopted the Arabic. They were in Lebanon and Anti-Lebanon as early as the 11th century. The peculiar interest attaching to this people belongs, however, more to their political constitution and their religion than to their origin. Politically the Druses are divided into two parties, that called the Jumblatiehs, with the family of Jumblat at their head; and the Yezbekiehs, with that of Abou-Nakod at their head. These two parties live in almost constant strife, except when they have a common foe to contend against, when they forget their internal dissensions and unite their strength for offense and defense. Their religion is a curious mixture of Judaism, Christianity, and Mohammedanism. They believe in one God, who is the only being to whom worship ought to be paid. According to their religious books he cannot be defined by any of the qualities belonging to created beings. The doctrine of the unity of the Deity does not admit, in their view, even of the consideration of any quality or attribute existing in him. They profess to believe in the unity of God with the abstraction of every quality and mode of existence. The Druses also believe that God has at different times appeared to men in a human form, and that his last appearance was under the name of Hakem, of Egypt, who announced himself at Cairo as a divine incarnation about 1030 A.D. They therefore regard Hakem as God, and they believe that he will one day return to earth, cause their religion to triumph, and punish the unbelieving. They have neither prayers, fasts, nor festivals, and, with the exception of a privileged class, the Akals, or initiated, they have no worship. When they go among the Turks they behave as Mussulmans, and in the midst of the Christian community of the Maronites they enter the Christian churches, and imitate the Christian believers in the use of the holy water. The uninitiated, called Jahils, are exempt from all religious duties whatever.

The Druses have also a peculiar moral code. They have seven commandments, a number taken from the sacred writings of the Mohammedans. The following, according to Hamsa, are their seven commandments, or cardinal principles: (1) Truthfulness; (2) mutual defense; (3) renunciation of all other religions;

DRUSILLA — DRY-GOODS TRADE

(4) separation from evil spirits and perverse men plunged in error; (5) recognition of the unity of God at all times; (6) contentment in all labors; (7) patience in all circumstances. At the end of the 16th century this people began to excite attention in Europe. In 1588 they were made tributary to Turkey by Amurath III.; but in the beginning of the 17th century recovered their independence, under the renowned Emir Fakreddin, and reached the summit of their power; but this leader was in 1635 strangled at Constantinople, and although other princes were placed over them, they never recovered their former reputation. They endeavored, indeed, by the assistance of the Russians in 1773, to regain their freedom; but they were soon obliged to become again dependent on the Turks. Troubles have more than once broken out between the Druses and the Maronites, their neighbors. An outburst of this kind occurred in 1800, and fearful atrocities were perpetrated upon the unhappy Maronites, who, however, seem to have been also aggressive. About 12,000 Maronites were killed and a large number were driven from their homes. A French force was sent out, and by its intervention tranquillity was restored. Since then, under a Christian governor appointed by the Porte, the Druses have been quiet. This outbreak resulted in the government of Lebanon about as it is at present. See **LEBANON**; **MARONITES**; **SYRIA**. Consult: Oliphant, 'Land of Gilead'; Carnarvon, 'Druses of the Lebanon.'

Drusilla, a daughter of Herod Agrippa I., king of the Jews. She was only six years old at the death of her father, 44 A.D., but had been betrothed to Epiphanes, son of Antigonos, who, however, refused to complete the match because one of its stipulations bound him to become a Jew. Azizus, king of Emesa, being less scrupulous, obtained her for his wife, but had not possessed her long when she divorced him to marry Felix, procurator of Judea. She is thus the Drusilla who is mentioned in the Acts, and was probably present when Paul preached before Felix.

Drusus, Marcus Livius, Roman politician: d. 91 B.C. Rome was divided by the disputes of the senate and the equestrian order. Drusus endeavored to gain over the people to the party of the senate by the division of lands, to which the senate agreed with the utmost reluctance, and to gain the Roman allies by the promise of citizenship. He came forward, relying on this assistance, as a mediator between the hostile parties. He succeeded in this, notwithstanding the most violent opposition from both parties, but the jealousy with which each party guarded its rights, and the rash and violent manner in which Drusus had effected the union, rendered him unpopular with both parties. On his return to his house from an assembly of the people, accompanied by a number of the Latins, he was stabbed at his door by an unknown hand. His death was the signal for the beginning of the social war which had been so long threatening.

Drusus, Nero Claudius, Roman general: b. 38 B.C.; d. 9 B.C. He was the first Roman general who penetrated to the German Ocean. He became prætor (11 B.C.), but returned in the next spring to Germany, subdued many tribes as far as the Weser, and commenced the erection

of fortresses. On this account he was appointed proconsul; the army saluted him with the title of *imperator*, which was not, however, sanctioned by Augustus. In 9 B.C. he was made consul, but returned soon after to Germany, and penetrated as far as the Elbe. The canal uniting the Rhine with the Yssel (*fossa Drusi*) was his work; and the place called Drusenheim, in Alsace, where he encamped for some time, received its name from him. His son Claudius afterward became emperor.

Dry Dock. See **Dock**.

Dry-Goods Trade, American. The beginning of the dry-goods trade in America dates from the time when the first colonists landed upon American shores, for it was not long after the first effort toward the settlement of this country was made that the demands for trading facilities resulted in the opening of the first store. So far as the actual trade in American textiles was concerned it is difficult to say just when, or how it commenced, but as it is impossible to imagine any time when people who had been used to the advantages of civilization would not have felt the need of a place to purchase some kinds of dress fabrics, it is pretty safe to say that the original American shop-keeper was soon compelled to add such merchandise to his stock in trade, even if it did not figure in his opening announcement. Of course, in those days all stores were general stores, and merchants handled, or tried to handle, every article for which there was any great demand. As the result their stock was of a most incongruous character. There were cottons and silks from India; there were velvets and woolens from various parts of Europe, and, side by side with the most costly articles known to colonial commerce, there were groceries, and hardware, and sundries of almost every description.

In the early days of the colonies, and even for many years after the settlement of the country had assumed quite respectable proportions, but little cloth was manufactured in America. The textile trade, such as it was, was almost entirely of an import character. In the beginning the retail dealers arranged for consignments of their own, and they were naturally of small value, but, as soon as the retail trade had extended sufficiently to make the establishment of a wholesale trade possible, the wholesale merchant became the importer, dealing directly or indirectly with the foreign markets.

So far as actual wearing apparel was concerned, the greater part were made by the people in their homes. The men of the households raised the flax or wool, which was carded, spun, and woven at home, for, at that period in our history, the distaff, the spinning-wheel, and the hand-loom occupied an important position at every well-regulated fireside. Moreover, it was by no means uncommon for the same hands that made the cloth to fashion the home-made fabrics into clothing for the use of the several members of the family. It was only the rich or more prosperous members of the community who were able to import their wearing apparel, to say nothing of their bed and table linen, and some years had passed before the customs tailor had assumed a position of any considerable commercial importance. Nowhere in America was the cultivation of cotton made a matter of much attention, and, when its manufacture in anything

DRY-GOODS TRADE

like an organized way began. it was, as in the case of wool, confined to a few establishments of crude construction and operation. They produced certain kinds of fabrics, it is true, but the only importance that they can have for us to-day lies in the fact that they marked the beginning of the great industries which have since been developed.

To really comprehend the fact that the great textile industry of our own time is a matter of comparatively modern development it is only necessary to remember that the inventions of Hargreaves, Arkwright, Paul, Crompton, and Cartwright, had scarcely become known in this country at the close of the 18th century. At this time our home products were confined to a few coarse woolen cloths; a few laces, and some sundries, in silk, and nothing more than coarse sheeting and toweling in linen. In fact, during the 18th century, even our imports of foreign textiles were of most moderate proportions, being scarcely more than double the value of the home products, for it was not until some time after the close of the Revolutionary War that American imports of textiles began to show any marked increase in value. Prior to that time, the value of the dry-goods imported from other countries ranged from \$24,000,000 to \$26,000,000 per annum, while the domestic product showed an annual value of between \$12,000,000 and \$13,000,000. Of course, the greater portion of this output represented the goods manufactured in the households of the country, very little of which ever appeared in the merchants' stock.

Comparatively populous as some sections of the country were, the village stores outside the centres of trade, were few and far between. Having but little demand for anything like costly grades of goods, the only textile products which they sold were the coarser textures in woolens, cottons, and linens, and these, with the usual supply of buttons and thread, were closely associated with the sale of rum, molasses, groceries, and some few articles of hardware. People living in the small towns that were located upon the banks of the inland streams seldom had greater trading facilities than those that were offered by the flatboats which visited them from time to time with stock which was similar in character to that of the village stores. Peddlers also went through the country, thus affording the scattered inhabitants of the interior an opportunity to make some few purchases from their meagre stock of wares.

In the cities, of course, there were both wholesale and retail dealers in the various commodities. The wholesale establishments not only imported such articles as were in most demand, but dealt in those products of home manufacture upon which they might realize the greatest profits. The shops of the retail dealers, however, resembled the country stores in that they sold almost everything that any customer might demand. It was only in the more pretentious establishments of the larger cities that there was any apparent tendency toward separate classification, in one or two instances dry-goods and notions being sold to the exclusion of everything else. In one sense of the word these conditions were largely due to the circumstances of the people. The custom of supplying as many of their wants as possible by the use of articles manufactured at home naturally reduced the sale of shop-made products, while the habit of trad-

ing by barter, instead of for cash, also had a tendency to retard the development of any large retail establishments.

During the five-year period prior to 1800, the imports of foreign merchandise paying ad valorem duties into the United States aggregated \$212,000,000, of which the textile imports represented about two-thirds. New York then, as now, was the chief importing city of the country, and the kind and character of the importations were cottons, woolens, silks, velvets, linens, laces, edgings, hosiery, gloves, and shawls, including damasks, dimities, callimancoes, durants, tabarets, platillas, listadoes, mamoodies, gurrahs, cossas, baftas, russets, satinets, duffels, britannias, etc. These goods came chiefly from India and China, and from the cities of Amsterdam, Hamburg, London, and Liverpool, and the most important importing houses in New York were those of Bethune & Smith, Murray's Wharf; John Knox, 97 Water street; McCready & Reid, 97 William street; Hector & Scott, 125 Pearl street; John & William Tabele, 260 Pearl street; Benjamin I. Moore, 103 William street; Charles J. Vogel & Company, 92 Maiden Lane; Richard & John Thorne, 141 Pearl street; William Blackstock & Company, 163 Pearl street; A. S. Norwood, 127 William street, and Robert & John Sharp, 93 Maiden Lane. Of these firms, A. S. Norwood dealt extensively in carpets and rugs, besides handling dry-goods more largely, perhaps, than any other house, while, among the other firms that sold dry-goods in connection with other foreign and domestic commodities, one must mention those of Archibald Gracie, 52 Pine street; James Stuart, 10 William street; Eben Watson & Company, 36 Old Slip; Ferguson & Crichton, 84 Broadway; Rogers & Lambert, 232 Pearl street; H. G. Rutgers & Company, 145 Pearl street; Rutgers, Seaman & Ogden, 93 Front street; Thomas Buckley, 241 Front street; Suydam & Wyckoff, 21 South street; Robert Weir & Company, 16 Gold street; John Knox, 97 Water street; Thomas Warren, 61 Maiden Lane; John McGregor, 84 Broadway; as well as Minturn & Barker, Thomas Napier & Company, Robert Lennox, Frederick de Peyster, Gouverneur & Kemble, John Murray & Sons, and others.

The fifteen years that elapsed between the beginning of the century and 1815 witnessed some trying ordeals for the trade and industrial interests of this country. These troubles began with the French complications; they were accentuated by the Embargo and Non-Intervention Acts, and they finally culminated with the war with Great Britain. With such restrictions upon our import trade, the wholesale business of the country stagnated, but, as was quite natural under such conditions, the effect had a tendency to foster our home industries. In 1803, our trade interests, both at home and abroad, were seriously influenced by the panic in Great Britain. In 1804, the first consignment of American cotton was made to Elijah Warren, of Philadelphia, Pa., by Almy & Brown, of Providence, R. I., and the former at once became their agent for yarns and thread, and, finally, for stripes, plaids, checks, tickings, ginghams, etc. During the next two years, however, the value of domestic cottons, produced by the New England factories and sold in Philadelphia, amounted to only \$17,670.

When the Embargo went into force, in 1807,

DRY-GOODS TRADE

our foreign trade, as a matter of course, was almost entirely suspended. At this time, however, there were not more than 4,000 cotton spindles in use in the entire United States, for progress in this line of industry had been slow. Before the close of the year, however, the number had doubled, and, by 1800, there were no less than 17 mills in operation in Providence, R. I., with 2,206 spindles, producing fully 510,000 pounds of yarn. About 1,000 looms were also in operation weaving cotton cloth.

The census report for 1810 gave some very clear evidence of the more or less rapid advancement that had been made in all the branches of the textile industry, especially in the manufacture of cottons and woollens. According to the report of the Treasury Department, the American product in cottons and woollens, exclusive of clothing and other goods, amounted to scarcely less than \$46,000,000, in 1810. Eli Whitney's invention of the cotton-gin had effected such a change both in the production and manufacture of cotton that it had suddenly become one of the nation's leading products.

During the period immediately following the war with Great Britain the importation of foreign goods increased so enormously that the market was not only glutted, but both the cotton and the woolen industries were paralyzed. In fact, so great was the fall in prices that many of the leading importers were almost ruined, while there were but few merchants who were not seriously handicapped by the general stagnation in nearly every line of trade. While this condition of affairs was partly due to the result of the war and the sudden reopening of our ports to foreign trade, this was by no means the only or most serious influence which was at work. To tell the truth it is necessary to admit that the business woes of the Republic were largely the result of a combined effort on the part of the foreign manufacturers to gain control of our markets. The reopening of American ports had given them the opportunity for which they had long been making preparations. The *ad valorem* rates of duty which then prevailed were low, and they seized the chance to unload the surplus stocks, which they had been quietly accumulating, upon the markets of the United States, with a view to crippling its textile mills and thus securing the trade of the country. The plot, serious as its effect was upon American business affairs, was successful, not only for the time, but for several years succeeding 1815.

The census reports for the decades ending with 1820, 1830, 1840, and 1850, give little useful evidence respecting the advancement in the textile industries. We may judge that it was both steady and gradual by the record given of the increased production of the spindles and looms of the country, especially so far as cotton and woolen products were concerned, but it was not until the year 1850 that these manufactures reached the point at which it was possible to plan for a broader national and industrial development. Many important processes and inventions were also perfected during this time. Among these innovations there was the sewing machine, the power-loom, the knitting machine, and several other labor-saving devices which had a marvellous effect upon the future growth of the textile interests.

The history of American industries during the first half of the 18th century is a record of almost countless vicissitudes for which such events as wars, panics, financial depressions, conflagrations, and other adverse conditions were responsible, but, instead of being discouraged by such experiences with unavoidable misfortunes they seem to have had a tendency to spur the manufacturers and merchants to more united efforts. In the latter years of this period the inauguration of improved methods, not only in the matter of manufacture, but also in the distribution and sale of all products, tended to bring about a finer classification of goods than had hitherto been carried out, and, for the first time in the history of trade in this country, both the wholesale and the retail dealer began to make more or less separate distinctions in the goods which they sold. Importers and wholesale dealers began to handle special or distinct lines, such as silks and dress-goods; cloths, coatings, and cashmeres; notions and small wares; hosiery, underwear and gloves; laces and embroideries; white goods and linens; or hats and caps. Gradually, moreover, the same well-defined distinctions came to be recognized by the retail trade in the cities, although the stores in the various towns and villages throughout the country continued to follow their original policy of carrying a miscellaneous stock of merchandise. The inception of the clothing trade, and, later, of the ready-made articles for women's and children's wear, helped to make the classification still more minute, while the inauguration of the commercial traveler system, and the general utilization of the commercial agency which followed, were important factors in helping to bring about the new conditions, the dawn of which was heralded in 1850. In this year the value of our cotton and woolen products amounted to fully \$112,000,000, while the total output of our combined textile interests aggregated \$129,000,000. At this time our imports of foreign dry-goods approximated \$59,000,000.

There were, of course, several factors which played a part in that betterment of conditions that began to be apparent about the middle of the century. The opening of the South and West, the establishment of new towns occasioned by the institution of new industries, and other evidences of prosperity, resulted in a larger and more diversified demand upon the manufacturers. Prior to 1850, practically no domestic commission business had been done in New York. Transactions of this kind had been confined to Boston, Baltimore, and Philadelphia. The bulk of the product of the New England mills went to Boston. Philadelphia, which had some 20 commission houses engaged in the sale of domestic goods, was the chief market for that product which was then designated as "blue goods," and which included denims, checks, stripes, etc. At this time large quantities of dry-goods were also sold at Hartford, Conn., but New York, which had always been the centre for imported goods, was not recognized by the domestic commission houses until the early fifties, when some of the Boston establishments opened branch offices in that city. Immediately, however, these offices sprang into such importance that it was not long before they were doing a greater bulk of business than the parent houses, and it was due to this reason that, one by one,

DRY-GOODS TRADE

the great Eastern mills began to open regular agencies in New York. In those days New York was so confined as to area that there were no retail houses above Howard street, and all the wholesale and jobbing business was conducted further down town, largely on lower Broadway, Cedar, Pine, Liberty, and Broad streets.

In the memorable panic of 1857, when all the business interests of the country were paralyzed, the dry-goods business was one of those that suffered the most severely. The trouble started with the failure of the Ohio Loan and Trust Company, on 27 August, and it attained its most serious proportions in the month of October, when the numerous failures, and the hairbreadth escapes from ruin, tried men's souls as well as their bank accounts.

According to the reports for 1860, the imports of dry-goods into the United States amounted to a little more than \$112,000,000, while the total value of our own textile manufactures were about \$215,000,000. Compared to the figures for 1795, the former had increased nearly fivefold, while the latter was almost eighteen times greater.

Then came the outbreak of the Civil War, and, during that memorable struggle for the preservation of the Union, the dry-goods interests were again affected. Beginning in December, 1861, the value of cotton goods continued to increase, until, at the end of two years, the price of such products had risen nearly 300 per cent. The year 1863 showed a still sharper rise, and the increase in price culminated in the fall of 1864, when the average increase in the cost of cotton goods had attained a mark of nearly 1000 per cent. Even raw cotton, in April 1864, sold at \$1.90 per pound. In Europe this period is still remembered as the "days of the cotton famine," for shipments of this staple from the United States had been almost entirely suspended since the beginning of the conflict between the cotton-using North and the cotton-producing South.

Lee surrendered on 9 April 1865, and by 30 June, the price of cotton had fallen to 40 cents per pound. So far as manufactured cottons were concerned, however, no proportionate decrease in price was shown for some time. In October, cotton was quoted at 64 cents per pound, but the price of prints, sheetings, etc., had fallen less than half from the price that had been current for them in 1864. It was during this year that one dry-goods jobbing house distributed goods broadcast throughout the country to the aggregate amount of \$72,000,000. In 1870 the imports of dry-goods amounted to only \$98,290,000, an increase of fourfold over the record for 1795, while the aggregate product of the home manufacturers was \$520,000,000, or an increase of nearly 2500 per cent.

There are several reasons that might be cited to explain why the dry-goods industry did not show a corresponding increase during the next decade in the history of the country. In the beginning, it must be remembered that American manufacturers were compelled to face some very serious vicissitudes. The period immediately following the war was a most uncertain one. Moreover, the increased production of the country, to say nothing of the improvement and cheapening of the facilities for manufacture,

naturally had a tendency to bring about a decline in all classes and kinds of textile products. Thus, while there was really a noteworthy increase in the quantity and variety of America's manufactures, the value of the output indicated but little augmentation. In 1880, therefore, the value of our textile products was but about \$533,000,000, an increase of less than \$13,000,000 over the record for 1870, while the importations of foreign dry-goods amounted to almost \$136,000,000, or an increase of nearly \$38,000,000.

It was during the next few years that the dry-goods industry began to attain a more stable position in the commercial world, and, with better financial conditions and more modern methods, not only in the manufacture, but also in the art of transacting business, the growth of these interests was a steady record of prosperity. That it has since attained to considerable proportions one may easily discover by reference to the latter census reports, for the value of the American output, which, in 1890, was \$1,261,672,504, by 1900 had attained the still more enormous figure of \$1,637,484,484.

In this review of the history of one of the nation's greatest industries, only the textile branch of the subject has thus far been considered, whereas the dry-goods merchants of to-day handle a multitude of articles that cannot be included in this classification. In fact, the disposition that has been shown by the large retail houses to buy and sell promiscuous merchandise, intermixing dry-goods proper with many different lines of trade, makes it almost impossible to secure anything like exact figures respecting the value of the annual distribution of wares through these sources. The latest census report divides the American manufacturing industries into 363 distinct classes, and, of these, fully one-sixth enter into the province of the modern dry-goods business.

At the same time it must be admitted that the wholesale dealer has kept step by step with the retail merchant. In the retail line of the trade the centralization of business interests has resulted in the creation of large and diversified establishments in the place of many smaller houses. Thus, in New York, for example, the present number of dry-goods' houses is by far smaller than that of 25, or even 50 years ago, and yet, at the same time, the aggregate amount of merchandise sold in that city exceeds by far that of any other period in the history of the trade, while in point of capital and labor employed it has attained proportions, the magnitude of which has never been approached.

When we consider the small beginnings of the dry-goods industry its present achievements certainly seem remarkable. When we examine the figures, according to the census reports, and the figures of other reliable statisticians, we find that the aggregate value of the country's output of textile products during the 19th century is not less than \$20,000,000,000, while the imports for the same period would not exceed \$7,000,000. Add to this total the freight, insurance, and duties on the foreign part, and the seller's profits on the entire amount, and we find that we have the enormous total of \$40,000,000,000. See CLOTHING AND FURNISHING TRADE; COLLARS AND CUFFS, MANUFACTURE OF; COTTON INDUSTRY; COTTON PRODUCTION; CARPET INDUSTRY; TEXTILE INDUSTRY; LACES; WEAVING; LOOMS; ETC.

DRY PILE — DRYDEN

Dry Pile, a very important form of galvanic battery, so named from the fact of its requiring merely a slight moisture among its leaves. Various kinds of dry piles are constructed. A very excellent one, Zamboni's dry pile, is made in the following way: Some sheets of paper, covered on one side with tin-foil or silver, such as are used for ornamental purposes, are moistened with sugar and water, and then rubbed over with very finely powdered black oxide of manganese. These are laid one on the top of the other, the silvered side of one being in contact with the oxide of manganese of the next. They are then cut with a punch into disks of about an inch in diameter, and they are put into a glass tube, care being taken that the order just mentioned is preserved. The tube is fitted at each end with a brass cap furnished with a knob, and it is filled so full that the paper disks are pressed firmly together. From 1,000 to 2,000 disks may be used. The knob at the oxide-of-manganese end will be found positively electrified, the other negatively. A pile containing 2,000 disks will charge a Leyden-jar. The glass tube is generally coated with shellac varnish to improve its insulating power. The sugar with which the paper is saturated is intended for a hygro-metric substance. If the pile be carefully kept it will preserve its power for many years. If it be artificially dried it loses it, but will frequently regain it when a sufficient amount of moisture has been absorbed from the air. Its action is quite similar to that of a galvanic battery. See BATTERY; ELECTRICITY; STORAGE BATTERY.

Dry Point, a sharp-pointed needle or instrument used by engravers to incise fine lines in copper without the plate being covered with etching-ground or the lines bit in by acid. This tool is much employed in working the more delicate portions of etchings, or in making whole pictures on copper called "dry-point" etchings. See ENGRAVING.

Dry Rot, a popular name for the decay of seasoned timber and for certain forms of decay of the trees while still standing. The latter kind is caused mainly by species of shelf-fungi and toadstools, which also attack the stumps of various trees. Economically, the former kind is the more important since it attacks timber after it has been put in place in buildings. In such cases the floors or walls may collapse with more or less damage to property, if nothing worse. The most common fungi producing this kind of dry rot are species of the genera *Polyporus* and *Merulius*, which produce similar effects. The spores germinate in the presence of moisture and the branching threads (*mycelium*) penetrate as far as the wood is moist, destroying the fibre of the wood. The fungus is at first white but later turns brownish-red, producing what is called "red-striped" timber. Drying only temporarily checks growth, for when moisture again reaches the wood the fungus recommences its work of destruction. The wood exposed to frequent changes of moistening and partial drying is most susceptible. But if properly seasoned and then protected by antiseptic treatment, or good paint, will be exempt unless the fungus has already gained entrance. In floors and walls only dry and non-alkaline sound-deadening substances should be used, since these do not favor the germination and growth of the spores which may be present.

Dry Tortugas, tór-too'gas, Florida, a group of small coral keys or islets, 10 in number, at the western end of the Florida Keys, in the Gulf of Mexico, about 70 miles from Key West, lat. 24° 30' N.; lon. 82° 54' W. The principal keys are: East Key, Bird Key, and Loggerhead; and are a part of Monroe County. During the Civil War the Federal Government confined prisoners at Fort Jefferson, on one of the islands, and this practice has been continued. It also serves as a quarantine station.

Dryad, in Greek mythology, a nymph of the woods; a deity supposed to preside over the woods; a wood-nymph. Dryads differ from hamadryads in that the latter were attached to particular trees, with which they were born and died.

Dryas, (1) a famous Spartan, slain by Diana in the Theban war; (2) a genus of rosaceous plants found in Alpine and Arctic regions; they are small, prostrate shrubs with large white or yellow flowers; (3) a genus of butterflies, of which one species is *D. paphia*.

Dryburgh, the ruin of a Premonstratensian abbey in Berwickshire, five miles from Melrose, on the Tweed. It contains the tombs of Sir Walter Scott and his son-in-law, Lockhart.

Dryden, John, English poet: b. Aldwinkle All-Saints, Northamptonshire, 9 Aug. 1631; d. London 1 May 1700. He was educated at Westminster, and Trinity College, Cambridge. Left to find his way to distinction by his own exertions, he joined the Royalist party, and hastened to congratulate the king by publishing, in 1661, the verses entitled 'A Panegyric to His Sacred Majesty.' The theatres, which had been closed by the Puritans, now newly opened, after so long a silence, were resorted to with all the ardor inspired by novelty, and seemed to offer the most promising reward. He accordingly prepared for representation the 'Wild Gallant,' acted in 1662-3, but without success. Not cast down by his failure he brought forward the 'Rival Ladies,' which was well received. His next production was the 'Indian Emperor,' which at once raised Dryden to a high pitch of public estimation. The great fire of London put a stop for some time to theatrical exhibitions. In the interval Dryden published the 'Annus Mirabilis,' an historical account of the events of the year 1666, one of the most elaborate of his productions. In 1668 he also published his celebrated 'Essay on Dramatic Poesy,' the first attempt to regulate dramatic writing. The fame of Dryden was now at its height, and so confident was he of the readiness and ease with which he composed, that he entered into a contract with the king's company of players, by which he became bound to produce for them no less than three plays in the course of the year. This was, however, tasking his muse too highly, as he could only produce about half the number contracted for. In 1668 the 'Maiden Queen,' a tragedy, was represented, with what success we are not told. This was followed in 1670 by the 'Tempest,' an alteration from Shakespeare, in which he was assisted by Sir William Davenant. It was received with general applause, notwithstanding the very questionable taste and propriety of the added characters. Dryden was shortly afterward appointed to the offices of royal historiographer and poet-laureate, with a salary of £200 a year.

From this period till 1681 Dryden's life was passed in dramatic composition, and in repressing the insolences occasioned by the jealousy of the small wits of the day. In this time he produced about a dozen of plays, mostly with marked success. Stimulated to exertion by the state of parties, he produced, in 1681, 'Absalom and Achitophel,' which for powerful yet delicate satire is perhaps unsurpassed by any poem in the language. In the next year he published 'The Medal'; 'Mac Flecknoe,' and 'Religio Laici.'

Shortly after the accession of James II. Dryden became a Roman Catholic. At court the new convert was received with open arms; a considerable addition was made to his pension, and his pen was put in requisition to defend the cause which he had adopted. 'The Hind and the Panther' (1687), a polemical poem, in which the controversy between the Roman Catholics and Protestants is allegorically described, went rapidly through several editions, which is rather to be attributed to the fame of the author, and to the adventitious circumstances in which it was published, than to any disposition to acquiesce in its arguments.

At the revolution Dryden was deprived of the offices of poet-laureate and historiographer, and he again turned his attention to dramatic composition. His tragedy of 'Don Sebastian' is of this period. It was at first coolly received, though brought out with great splendor, and it was not till several retrenchments and alterations were made that it rose to that high place in public estimation which it so long maintained. His last play, 'Love Triumphant,' was acted in 1694. During the year previous he had published, with Congreve, Creech, and others, a translation of Juvenal, and one of Persius entirely by himself. About a third part of Juvenal was translated by Dryden, who wrote an essay on satire which was prefixed to the whole. His translation of Virgil appeared in 1697, and so eagerly was it sought after that a new edition was called for in the course of the first six months. Dryden had hardly finished 'Virgil' when he distinguished himself by his immortal 'Ode to St. Cecilia,' commonly known by the name of 'Alexander's Feast.' In 1699 he published his 'Fables,' imitations of Boccaccio and Chaucer. He was buried in Westminster Abbey, between the graves of Chaucer and Cowley.

As a poet Dryden stands very high. What was said of Rome, adorned by Augustus, has been applied by Johnson to English poetry, improved by Dryden—he found it of brick, and left it of marble. In his hands it lost the harshness which distinguishes the writings of Donne and of Cowley, and became eminently harmonious and powerful, but often somewhat turgid. His power of satire is unrivaled. While the lesser poets of the day were encumbering it with foul invective, he struck out a new path in the art. His strong and trenchant blade cut deep, while the coarse weapons of his rivals would not penetrate the surface. Of his powers as a tragic poet his 'Don Sebastian' affords the best example. His comedies are unfortunately stained by the license of the age. See Saintsbury, 'Dryden' (1881); Garnett, 'Age of Dryden' (1896).

Dryden, N. Y., village, in Tompkins County: on the Lehigh V. R.R.; noted principally as a health resort on account of its min-

eral springs. The village of Freeville, noted for the George Junior Republic (q.v.), is nearby. Pop. 700.

Drying Machine, originally a machine for drying printed calicoes. The apparatus is in a hot room, and has a series of heated steam chests and cylinders with upper and lower rollers, over which the cloth is exposed to the drying air of the apartment. Similar drying cylinders are now used in paper-making machines, both the cylinder machines and those of the Fourdrinier pattern, in which the sheet of pulp is felted on an agitated horizontal web. Drying machines are also used in bleaching, drying, and laundry works; the cylinders, in which the articles to be dried are placed, being made to revolve with great speed, the moisture is thus driven away by the action of centrifugal force. A recent method of drying wool and other textile material is by the Blackman air-propeller. The wool is spread over a perforated surface which is in connection with a revolving propeller, with peculiarly shaped blades, placed at the top of a vertical trunk or shaft. This apparatus dries the wool by drawing heated air through it and expelling the air at the top through a turret in the roof of the building in which it is placed. Yarns are frequently dried by passing through a hot chamber, by means of continuous chains, upon which rollers carrying the hanks are placed.

Dryobalanops, drī-ō-bāl'a-nops, a small genus of trees found in the Malay Archipelago. The principal species is remarkable as the source of the Borneo or Sumatra camphor, which is found filling cracks and crevices in the wood. See CAMPHOR.

Dry'ophis, a genus of non-venomous, colubrine tree-snakes of India and Malay countries, called whip-snakes owing to the extreme slenderness of their long and flexuous bodies. They move very awkwardly on a smooth surface, but when twining and climbing among branches of trees, whose foliage they simulate in color, they are swift and graceful in the extreme. While retaining their hold by means of a few coils of the tail, their length enables them to dart forth the head to a great distance and seize some lizard or bird unaware of their proximity.

Drysdale, William, American journalist and author: b. Lancaster, Pa., 11 July 1852; d. Cranford, N. J., 20 Sept. 1901. In 1876 he was editor of the Philadelphia *Times*; and for over 20 years was on the staff of the New York *Times*, acting as its foreign correspondent (1877-99). He was a popular writer of juvenile stories, and his books have had a wide circulation. They include: 'Proverbs from Plymouth Pulpit' (1887), selections from the writings and addresses of Henry Ward Beecher; 'The Princess of Montserrat' (1890); 'The Mystery of Abel Forefinger' (1893); 'The Young Reporter' (1895); 'The Fast Mail' (1896); 'The Beach Patrol' (1897); 'Helps for Ambitious Boys' (1899); 'Helps for Ambitious Girls' (1900); 'The Treasury Club' (1900); 'Pine Ridge Plantation' (1901); 'The Young Consul' (1901).

Dschakowa, dyā-kō'vā, or **Dyakova**, Turkey, city, in the northeast of Albania, on the Grenik, 63 miles east-northeast of Scutari. It contains six mosques, a Roman Catholic and a Greek church. Pop. about 25,000.

Dual, in grammar, that number or inflection which is used in some languages when two things are spoken of, whilst another number (the plural) exists to express many. The dual in some languages is a firmly-established grammatical form, as in the classical Greek; in other languages it is used only in certain cases with certain words, or only faint traces of it are to be recognized. The Sanskrit has a dual number. Of modern languages which have a literature, Arabic is the only idiom which has retained it. The Anglo-Saxon had a dual in the declension of the first and second personal pronouns; for example, *weit*, we two; *git*, you two; *uncer*, of us two; *incer*, of you two.

Dual Personality, (1) the supposed distinction, and potentially independent action, of each of the cerebral hemispheres; from one of which, the left, arise all the good and ennobling aims of life, while from the other come all the malevolent influences. (2) The heretical doctrine attributed to Nestorius of the two-fold personality of Christ.

Du'alín, an explosive compound containing 30 parts of fine sawdust, 20 of saltpetre, and 50 of nitroglycerin. Also called dualin-dynamite. See **EXPLOSIVES**; **NITROGLYCERIN**; etc.

Du'alism, Dualist. Dualism is the opposite of monism, the philosophical exposition of the nature of things by the adoption of two dissimilar primitive principles, not derived from each other: such, for instance, are the ideal and the real, or matter and spirit. Sir William Hamilton divides dualists into natural dualists (or natural realists), who believe that we have an immediate knowledge both of mind and matter; and hypothetical dualists (or cosmothetic idealists), who believe that we have an immediate knowledge of nothing but mind, but who nevertheless, by various reasonings and arguments, attempt to prove the real existence of an external world. In a stricter sense dualism is confined to (a) the adoption of two fundamental beings, a good and an evil one, as is done in some Oriental religions; (b) to the adoption of two different principles in man, namely, a spiritual and a corporeal principle: this is called the psychological dualism.

Duane, James, American jurist: b. New York 6 Feb. 1733; d. Duaneburg, N. Y., 1 Feb. 1797. He established a settlement at Duaneburg in 1765; took up the practice of law, and became prominent in his profession. Having bought a considerable amount of land in the territory known as the New Hampshire grants, now included in the State of Vermont, he was one of the principal advocates of New York's right to that territory; and when New York officials were driven out by Ethan Allen and his followers, Duane was the leader of those who induced the legislature to declare the Vermonters traitors and outlaws. He was elected to the first Continental Congress, and was a member of the Congress throughout its existence. He was a supporter of the conservative party, believing in the English form of government and opposed to republicanism, and he stood against the signing of the Declaration of Independence, striving to delay, and if possible prevent, separation from England. He returned to New York after its evacuation by the British, and was the first mayor under the new

charter (1784-89); was a member of the committee to draft the State Constitution of New York; sat in the State Senate 1782-85, and 1789-90; and was United States district judge 1789-94.

Duane, James Chatham, American military engineer: b. Schenectady 30 June 1824; d. New York 8 Nov. 1897. He was graduated from West Point in 1848, and was instructor there for a time. He was engineer in charge with the Utah expedition 1858, and served in the Civil War with the Army of the Potomac and the Army of the South. In 1865-68 he had charge of the construction of defenses at the eastern entrance to New York harbor; was lighthouse engineer for the northeast Atlantic coast, and superintendent of fortifications in Maine and New Hampshire; in 1886 he became chief of engineers with the rank of brigadier-general, and retired in 1888. From 1888 to 1897 he was one of the Croton aqueduct commissioners.

Duane, William, American politician: b. near Lake Champlain, N. Y., 1760; d. Philadelphia, Pa., 24 Nov. 1835. He learned printing, and in 1784 went to seek his fortune in India. He rapidly amassed property, and became editor of an Indian journal, entitled the 'World.' Having taken sides against the local government in a dispute with some of its troops, he was seized and sent to England, and his large fortune was confiscated. In 1795 he returned to America, and became editor of the 'Aurora,' published at Philadelphia, which was made by his able management the most influential organ of the Democratic party; so much so, that Jefferson attributed to its vigorous support his own election to the Presidency. The change of the seat of government from Philadelphia to Washington caused the 'Aurora' to decline in political importance. Duane retired from its editorship in 1822, and then traveled through the republics of South America. On his return he published 'A Visit to Colombia' (1826). His other works include 'Military Dictionary' (1810); and 'Handbook for Riflemen' (1813), which were for some time standard authorities.

Duane, William John, American politician: b. Clonmel, Ireland, 9 May 1780; d. Philadelphia 26 Sept. 1865. He was a son of William Duane (q.v.). Appointed secretary of the treasury by President Jackson in 1833 he was removed from office the same year because of his refusal to allow the government deposits in the United States Bank to be removed without the authorization of Congress.

Duban, Jacques Félix, zhāk fā-lēks dü-bān, French architect: b. Paris 14 Oct. 1798; d. Bordeaux 20 Dec. 1870. He studied under Debret, and his first work of importance was the completion of the Palais des Beaux Arts, in the execution of which he is charged with having sacrificed harmony of proportion and strength to a fondness for ornamentation. In 1845 he was employed in the restoration of the ancient chateau of Blois, and in 1848 was appointed architect of the Louvre. The façade on the river side, and the Apollo gallery, were restored from his plans.

Du Barry, Jeanne Bécu, zhān bā-kü dü bā-rē. COMTESSE, mistress of Louis XV: b. Vaucouleurs 19 Aug. 1746; d. Paris 6 Dec. 1793.

She was presented to the King in 1769, who had her married for form's sake to the Count du Barry. She exercised a powerful influence at court, and with some of her confidants completely ruled the King. Important offices and privileges were in her gift, and the courtiers abased themselves before her. After the death of Louis she was dismissed from court and sent to live in a convent near Meaux. She received a pension from Louis XVI. During the Reign of Terror she was arrested as a royalist and executed.

Du Bartas, dü'bār'tā', Guillaume Salluste, French poet: b. Montfort, in the department of Gers, 1544; d. Ivry 14 March 1590. He undertook various diplomatic missions to foreign courts for the Huguenot cause; fought in the Huguenot army and was killed in the battle of Ivry. His fame rests upon two epic poems, the second unfinished, entitled 'La Sepmaine' (The Week) and 'La Seconde Sepmaine.' The first, which is far the better of the two, describes the creation of the world; the second the period from the creation to the incarnation of Christ. These poems were very popular in France, and in 1598 Joshua Sylvester translated them into English.

Du Bellay, Jean, zhōn dü bēl-lā, French cardinal and statesman: b. 1492; d. Rome 16 Feb. 1560. He enjoyed the favor of Francis I., and was sent as ambassador to Henry VIII. of England and the Pope, Paul III. He became Bishop of Bayonne in 1526, Bishop of Paris in 1533 and Cardinal in 1535. He was appointed lieutenant-general of the kingdom during the absence of Francis, who was engaged against the Emperor Charles V. in Provence. Falling into disgrace on the death of this king, he retired to Rome. Du Bellay protected and encouraged letters, and it was at his suggestion that the College of France was founded. Rabelais was attached to his establishment.

Dubbs, Joseph Henry: b. North Whitehall, Pa., 5 Oct. 1838. He was graduated at Franklin and Marshall College 1856, and at the Mercersburg Theological Seminary 1859. After several pastorates in the Reformed Church he became in 1875 professor of history and archaeology in Franklin and Marshall College. He is a member of various ethnographic and historical societies in the United States, Great Britain, and France, and has published: 'Historic Manual of the Reformed Church' (1885); 'Home Ballads and Metrical Versions' (1888); 'Why am I Reformed?' (1889); and a large number of historical monographs, addresses, etc.

Dublin, Ireland, on the river Liffey, within a mile of Dublin Bay. The Liffey divides the city into two equal parts. From the point where the Liffey enters the bay it is embanked on either side with a wall of freestone, forming a range of spacious quays throughout the whole city. The river is crossed by nine handsome bridges, six of stone, two of iron, and one swivel-bridge. Dublin is also nearly insulated by two canals, very important for inland communication. The houses, with the exception of the principal public structures, are generally brick, and from three to five stories high. The principal thoroughfares are toward the south side of the city. Grafton Street is the busiest commercial locality in Dublin, and Westmoreland Street, connecting the south side by O'Connell Bridge with Sackville

Street, which contains monuments to O'Connell and Nelson. The O'Connell Bridge, formerly called Carlisle Bridge, was rebuilt and opened for traffic in 1880. A line of railway, called the "Loop line," joins the north and south sides of the city, and forms a through connection between the four railroad systems of Ireland.

In the centre of the south side stands Dublin Castle, on a slight elevation, originally built early in the 13th century. It is now the official residence of the Lord-Lieutenant of Ireland, but is more remarkable for size than for architectural features. The castle chapel is an exquisite specimen of Gothic architecture. East from the castle, and facing College Green, is the Bank of Ireland, formerly the Irish Parliament House, a large and elegant structure, with a noble colonnade of Ionic pillars. At right angles to the bank, and facing the same area, is Trinity College, an imposing modern structure of the Corinthian order. The pile of buildings known as the Four Courts, stretching along King's Inns Quay has a portico of six Corinthian columns. It accommodates the courts of chancery, queen's bench, common pleas, and exchequer, which are now united under the title of The High Court of Justice. The most important of the other public buildings are the custom-house, with a cupola 125 feet high; the King's Inns, the post-office, rotunda, corn exchange, the mansion-house, corporation buildings, sessions house, the Wellington military barracks, Mountjoy convict prison, North and South Union workhouses, south city markets, Christian Union buildings, Royal College of Surgeons, the Science and Art Museum, the Leinster Hall, and the four railway stations.

The most important literary and scientific institutions are Trinity College; the Royal University of Ireland; the Roman Catholic University College; Wesley College; the Royal Dublin Society; the Royal Hibernian Academy of Painting, Sculpture, and Architecture; the Royal Irish Academy; the Archaeological Society; and the Royal Zoological Society. The principal libraries, besides that of Trinity College, are the National Library; Marsh's Library, containing about 18,000 volumes; and that of the Royal Dublin Society. At Marlborough House are the extensive buildings in which the National Board of Education has its chief offices. They consist of two training colleges for teachers, with practising schools, professors' offices and book-stores. In the centre of College Green is an equestrian statue of William III., erected in 1701, and in front of Trinity College are bronze statues of Burke and Goldsmith. There are also statues of O'Connell, Moore, Grattan, Smith O'Brien, Sir John Gray, and others. In the Phoenix Park is an obelisk, 210 feet high, in honor of the Duke of Wellington. Glasnevin Cemetery, to the north of Phoenix Park, contains memorials to O'Connell, the "Manchester Martyrs," Curran, Hogan, and others.

Dublin contains two Protestant Episcopal cathedrals—St. Patrick's and Christ Church. St. Patrick's Cathedral is an antique building, erected in 1190. Between 1860 and 1865 it was restored at a cost of £150,000 by Sir B. L. Guinness, M.P. Christ Church, built in 1038, the ancient cathedral of Dublin, is another venerable pile. In 1878 it was reopened after being restored at a cost exceeding £200,000. St. George's Church is of pleasing architecture; and

DUBLIN

a fine Presbyterian Church is in Rutland Square. The Roman Catholic Cathedral in Marlborough Street is a large edifice. The charitable institutions are numerous, and some of them possess splendid buildings. They include among them the Royal Hospital for disabled soldiers, designed by Sir Christopher Wren; several infirmaries; the lying-in hospital; two lunatic asylums, one of which, St. Patrick's, or Swift's Hospital, was founded by Dean Swift. The Royal Barracks, affording accommodation for 5,500 men, are in the west end of the town, near the river. There are several other military barracks.

A little northwest of the city, up the Liffey, is the Phoenix Park, one of the most extensive and beautiful public parks of which any European city can boast. Its area is 1,759 acres. In the Phoenix Park are the Vice-regal Lodge, the residence of the lord-lieutenant; the chief secretary's and under-secretary's official residences; the Royal Hibernian Military School and the depot of the Royal Irish Constabulary; also the gardens of the Royal Zoological Society. In 1880 St. Stephen's Green, on the south side of the city, became a public park through the munificence of Lord Ardilaun; and in 1887 Killiney Hill also was opened as a public park by Prince Albert Victor.

The manufactures carried on in Dublin are of little note. The poplins, a fabric of silken warp and woolen weft, for which Dublin has long been celebrated, are still in some demand, and there is considerable brewing and distilling. The trade by water is important, the tonnage of the shipping entered and cleared amounts to considerable each year. Dublin returns four members of Parliament. Pop. (1901) 289,108.

Dublin, University of. The first university of Dublin was founded in 1320 in connection with Saint Patrick's Cathedral. Having no endowment, and owing to changes in government and religion throughout the country, the university gradually declined, until it ceased to exist in the reign of Elizabeth. The present university was founded in 1591, when a charter, or letters-patent, was granted by Queen Elizabeth for the incorporation of the "College of the Holy and Undivided Trinity." This college is stated in the charter to be incorporated as the "mother of an university," whence it appears that it was intended to be only the first of a number of colleges to be afterward established in connection with the same university, the senate of which is incorporated by a charter distinct from that of Trinity College. Up to this time, however, no other such colleges have been established, so that Trinity College alone still enjoys the rights of the university. Although Elizabeth promised much, but little was done by the Crown for the support of the institution. The suppressed monastery of All Hallows was given to the new university and a fund was raised among the Irish nobles. Under James I. more aid in money and lands was given to the school. In 1637 changes were made in the constitution of the university.

The members of the corporation consist of a provost, 7 senior fellows, 26 junior fellows, and seventy foundation scholars. The management of the college is entrusted to the provost and senior fellows in conjunction with the visitors and the council, the last named body consisting of the provost, four senior fellows,

four junior fellows, four professors who are not fellows, and four other members of the senate. The senate of the university, as incorporated by royal charter, consists of "the chancellor of the university, or, in his absence, of the vice-chancellor, and such doctors or masters of the university as shall have and keep their names on the books of Trinity College." The senate possesses, under prescribed conditions, the right of electing the chancellor of the university. It is also the body which grants degrees; subject to the sanction of the college board and of the caput of the senate. This latter body consists of the chancellor or vice-chancellor, provost (or vice-provost), and the senior master non-regent, and every member of the caput has the right of refusing a degree by a veto. The fellows are appointed for life. The senior fellows are promoted from the number of the junior fellows in order of seniority, and every vacancy among the junior fellows is filled up by the provost and senior fellows after a strict examination for 12 days in mathematics, pure and applied, experimental sciences, classics, with Hebrew and cognate languages, and mental and moral science. The scholars are chosen from among the undergraduates, after an examination in pure and applied mathematics and logics or experimental science, or in Greek, Latin, and English composition. Non-foundation scholars are not members of the corporation of the college. Scholars receive an annual salary of £20, have their commons free of expense, and their rooms for half the charge paid by other students. They hold their scholarships until the end of the June quarter of the fifth year following their election, or following the time at which they become or might have become masters of arts, whichever period terminates first. Students, before being admitted, must submit to an examination in Greek, Latin, arithmetic, English composition, history, and geography. Students may enter as belonging to one of four classes. The first consists of noblemen, noblemen's sons, and baronets. The second consists of the fellow-commoners (who dine at the fellows' table). The third and most important is the class of pensioners, forming the great body of the students; and the fourth is the sizars, who are partially maintained out of the college funds and are now admitted by competitive examination. These last are limited to 30 in number. The academical year is divided into three terms—Hilary, Trinity, and Michaelmas term. To obtain the B.A. degree the student must keep eight terms in all, covering normally four academic years. Terms are kept during the undergraduate course, either by lectures or by examinations, but terms in divinity, law, medicine, and engineering must be kept by attendance on the lectures of the professors. The system of instruction is superintended by the fellows, together with a large staff of professors. Several of the junior fellows act as tutors, and every student must place himself under one of these on entering the college. The tutors during term deliver lectures on the subjects necessary to a degree. These are: In the first year, mathematics, Greek, Latin, English composition; in the second year, mathematics, mathematical physics, logic, Greek, Latin, English composition; in the third year, logic, mathematical physics, English composition, Greek, Latin, experimental and natural science, astronomy, history; French, German; and in the

DUBOC — DUBOIS

fourth, astronomy, ethics, English composition, logic, mathematical physics, languages, experimental and natural science, history, and political science. During the first academic year a student is called a junior freshman; during the second, a senior freshman; during the third, a junior sophister; and during the fourth, a senior sophister. Students who have successfully passed all the necessary examinations in the course given above, have the degree of B.A. conferred on them by grace of the senate in full congregation. Those who wish to obtain honors must pass through a more extended course of study. Honors are attainable in seven departments: 1, mathematics and mathematical physics; 2, classes; 3, logic and ethics; 4, experimental science; 5, natural science; 6, history and political science; 7, modern literature. Those who successfully pass the examinations in any of these departments are classed according to merit as senior or junior moderators, and respondents. Noblemen and noblemen's sons are entitled to have the degree of B.A. conferred on them *per specialem gratiam*; and fellow-commoners are entitled to receive it with one term-examination less than pensioners. The degrees are conferred on commencement days, of which there are four in each year. There are divinity, law, medical, and engineering schools in connection with the university, and degrees or licenses in each of these branches are granted by the university senate on the completion of the prescribed courses. The degrees of D.Sc. and Litt.D. are conferred on B.A.'s who have shown certain scientific or literary claims. The degrees of bachelor and doctor in music are also conferred.

The college possesses a fine library of about 250,000 printed volumes and 1700 manuscripts; and the number is increased annually by about 1,500 volumes, which are partly purchased and partly obtained under the copyright act. It has also a well-stocked botanic garden and museum. The observatory, five miles distant, at Dunsink, is the official residence in Ireland of the royal astronomer. In 1613 James I. granted to the university the right of returning two members to Parliament. One was taken away at the Union, but was restored by the reform bill of 1832. The parliamentary constituency consists of the provost, fellows and foundation scholars, ex-fellows and ex-foundation scholars, masters of arts, surgery, and engineering, and graduates holding all higher degrees.

Duboc, dü-bōk', Julius, German author: b. Hamburg 10 Oct. 1829; d. June 1903. He studied at Giessen, Leipsic and Berlin; and wrote much for the leading liberal periodicals, especially the 'National Zeitung.' He published 'Geschichte der Englischen Presse' (1873); 'Die Psychologie der Liebe' (1874); 'Das Leben ohne Gott' (1875); 'Gegen den Strom' (1877); a collection of his earlier essays: 'Der Optimismus als Weltanschauung' (1881); 'Jenseits von Wirklichen' (1896); and 'Fünfzig Jahre Frauenfrage in Deutschland,' a collection of essays on the woman question.

Dubois, dü'bois', Augustus Jay, American engineer: b. Newton Falls, Ohio, 25 April 1840. He was graduated at Sheffield Scientific School in 1869; in 1874 was appointed professor of civil engineering at Lehigh university, and in 1876 professor of mechanical engineering at Sheffield Scientific School. After 1884 he was professor

of civil engineering at the last institution. He has published 'Elements of Graphical Statics' (1876); 'The New Method of Graphical Statics' (1876); 'Strains in Framed Structures' (1883; 11th edition, 1900); 'Elements of Mechanics' (1893-5).

Dubois, Clément François Théodore, klāmôn frân-swâ tâ-ô-dôr dü-bwâ, French musical composer: b. Rosnay (Marne) 1847. He studied at the Paris Conservatory, and won the Prix de Rome in 1861. He was organist at the Church of the Madeleine, professor of harmony, then professor of composition at the Conservatory, and finally became director of that institution. In 1894 he became a member of the Academy of Fine Arts. His compositions include the cantata, 'Atala'; the operas, 'Aben Hamet'; 'Xavier'; and 'Circe'; the oratorios, 'The Seven Words of Christ', and 'Paradise Lost'; 'The Baptism of Clovis'; and a number of organ pieces, masses, etc.

Du Bois, dü-bois', Constance Goddard, American author: b. Zanesville, Ohio. She has been an active supporter of efforts to improve the condition of the Mission Indians of Southern California. She has published 'Martha Corey: a Tale of the Salem Witchcraft' (1890); 'Columbus and Beatriz' (1892); 'A Modern Pagan' (1895); 'The Shield of the Fleur-de-Lys' (1895); 'A Soul in Bronze' (1900).

Dubois, Edmond Paulin, őd-môn pō-lăn dü-bwâ, French hydrographer: b. Brest 12 July 1822; d. there 11 Nov. 1891. He made voyages in the Indian Ocean and along the west coast of Africa; and in 1851 was made professor at the Ecole Navale in Brest. He invented a compass with a double needle to determine the variation due to the ship's ironwork, and wrote 'Cours d'Astronomie' (1858); 'Etude historique et philosophique sur le Mouvement du Globe' (1861); 'Les Passages de Vénus sur le Disque Solaire' (1883); 'Cercle nautique' (1888); and edited the 'Ephémérides Astronomiques.'

Dubois, Guillaume, gē-yōm, French cardinal and statesman: b. Brives-le-Gaillard, Corrèze, France, 6 Sept. 1656; d. Versailles 10 Aug. 1723. He became tutor to the Duke of Chartres, afterward Duke of Orleans, and when in 1715 the Duke was declared regent, Dubois was appointed by the Duke counselor of state. He succeeded in overcoming the dislike of George I. of England to the person of the regent, and in 1717 concluded the triple alliance between England, France, and Holland. He was rewarded by the ministry of foreign affairs, and began to aspire to the highest dignities of the church. The archbishopric of Cambrai having become vacant, Dubois ventured to request it of the regent, although he was not even a priest. As the king of England united with Dubois in his request, he obtained it, and in one morning received all the orders, and a few days after, the archbishopric. By his consummate address he obtained a cardinal's hat, and in 1721 was appointed prime minister.

Dubois, Jean Antoine, zhōn ān-twān, French abbé and missionary: b. Saint-Remèze, department of Ardèche, 1765; d. Paris 7 Feb. 1848. He spent 32 years in the East Indies, and on his return published 'Letters on the State of Christianity in India' (1823); which produced

DUBOIS — DUBUQUE

much controversy in England from the fact of his having frankly expressed therein his disbelief in the possibility of the conversion of the Hindus. He wrote several works relating to the religion and the traditions of India, and many contributions to the 'Bulletin des sciences,' and to the journals of the Asiatic societies of London and Paris. His most celebrated work, 'Description of the Character, Manners, and Customs of the People of India, and of their Institutions, Religious and Civil,' was purchased for £800 by the East India Company, published at its expense in London in 1816, and afterward published in French under the title of 'Mœurs, institutions, et cérémonies des peuples de l'Inde' (1825).

Dubois, John, American Roman Catholic bishop: b. Paris 24 Aug. 1764; d. 20 Dec. 1842. As student in the College Louis le Grand he had as fellow students Camille Desmoulins and Robespierre. In 1781 he was ordained priest. With thousands of others of other ecclesiastics he was forced to flee from France in the Revolution and came to the United States in 1791. His first charge in this country was at Norfolk, Va., whence he was transferred to Richmond; there he was for a time a guest in the house of James Monroe and was the friend of prominent citizens, Patrick Henry undertaking his instruction in the English language. From Richmond he was transferred to Frederick, Md., the only priest then stationed between Baltimore and St. Louis. In 1809 he founded Mount St. Mary's College near Emmittsburg, Md., and was its first president, occupying at the same time two or three professorships. In addition he assumed the duties of chaplain and director of the house of the Sisters of Charity then founded by Mrs. Seaton in the neighborhood of Emmittsburg. He was subsequently appointed Bishop of New York, the diocese including that State and New Jersey, with a Catholic population of 150,000 souls, 8 church buildings and 18 priests. Owing to old age and increasing infirmities in 1838 he obtained a coadjutor in the person of John Hughes, who became his successor.

Dubois, Louis, loo-ë, Belgian painter: b. Brussels 1830; d. there 28 April 1880. He was one of the most prominent painters of the realistic school, and worked equally well as a painter of portraits, marines, still life, and landscapes. Among his works are: 'The Rice Eater'; 'The Meuse'; 'Priests Preparing for Mass'; and 'The Billiard Player.'

Dubois, Paul, pöl, French sculptor: b. Nogent-sur-Seine 18 July 1829; d. Paris 23 May 1905. In 1837 he entered the College Louis le Grand, and later took up the study of law, which he followed until his 27th year, when he became a pupil of Toussaint (q.v.). In 1863 he exhibited 'Narcissus at the Bath,' now in the Luxembourg, and in 1864, a bronze of John the Baptist as a young man. 'The Florentine Minstrel,' also in the Luxembourg, was his most popular work. Among his productions was a successful statue of 'Joan of Arc,' in Rheims. The most elaborate of his sculptures was a tomb in Nantes Cathedral, decorated with many statues and bas-reliefs. He was also a painter. He was made an officer of the Legion of Honor in 1867, and became grand officer in 1889. He was a director of the Luxem-

bourg, and also of the National School of Fine Arts.

Du Bois, dü-bois', William Edward Burghardt, American educator: b. Great Barrington, Mass., 23 Feb. 1868, of negro descent. He was graduated at Fisk University 1888, and at Harvard 1890, subsequently studying at the University of Berlin. He has been a Fellow of Harvard, assistant in sociology at the University of Pennsylvania, and since 1896, professor of economics and history in Atlanta University. He has published: 'The Suppression of the African Slave Trade to the United States, 1638-1870' (1896); 'The Philadelphia Negro' (1899); 'Relation of the Negro to the Whites in the South' (1901); 'Souls of Black Folk' (1903); 'The Negro Artisan: Report of a Social Study' (1903), in the Atlanta University publications, of which he is general editor.

Du Bois-Reymond, Emil, ä-mël dü bwä-rä-mön, German physiologist: b. Berlin 7 Nov. 1818; d. there 26 Dec. 1896. He studied theology, geology, and latterly anatomy and physiology at Berlin under Johann Müller, whom he succeeded as professor of physiology in the University of Berlin in 1858. In 1867 he became permanent secretary of the Berlin Academy of Sciences. His principal publication is 'Researches in Animal Electricity' (1848-84); but he published several other technical works, and also some lectures of which the chief is entitled 'Ueber die Grenzen des Naturerkennens'.

Dubois, dü-bois', Pa., a borough in Clearfield County; situated on the Buffalo, R. & P., and the Allegheny V. R.R.'s; about 80 miles northeast of Pittsburg. It is in a coal mining region, and besides its mining interests, it has iron works, flour and lumber mills, and other industries; a large amount of mining and agricultural implements are manufactured. Pop. (1900) 9,375.

Dubovka, doo-böf'kä, Russia, city, in the government of Saratov, on the Volga. It has an extensive river trade in wool, iron, oil, and grain. Pop. (1902) 17,123.

Dubufe, Claude Marie, klöd mä-rë dü-büf, French painter: b. Paris 1790; d. 24 April 1864. He was a pupil of David; among his works are: 'Achilles Protecting Iphigenia'; 'Christ Still-ing the Tempest'; 'Release of St. Peter'; 'Surprise'; 'Village Girls of Normandy'; and portraits of Louis Philippe and the Queen of the Belgians.

Dubufe, Edouard, ä-doo-är, French painter: b. Paris 30 March 1820; d. Versailles 10 Aug. 1883. He was a pupil of his father, Claude Marie Dubufe (q.v.), and of Delaroche. Among his works are portraits of the Empress Eugenie, Rosa Bonheur, Gounod, the Younger Dumas, and Emile Augier; also a number of religious paintings, including 'The Prodigal Son.'

Dubufe, Edouard Marie Guillaume, ä-doo-är mä-rë gë yöm, French painter: b. Paris 16 March 1853. He is a son of Edouard Dubufe (q.v.). Among his paintings are 'St. Cecilia'; 'Music, Sacred and Profane'; 'Autumn'; 'The Flight into Egypt'; and several portraits. He has also decorated the Hôtel de Ville in Paris and the Salle des Fêtes de l'Elysée.

Dubuque, doo-bük', Iowa, city, county-seat of Dubuque County; on the Mississippi

River, the Burlington, the Chicago G. W., the Chicago, M. & St. P., and the Illinois C. R.R.'s, 189 miles northwest of Chicago. It has steamer communication with the leading ports on the Mississippi and is connected with the opposite shore of the river by two bridges. The city is built partly on a terrace 20 feet above the river, and partly on the bluffs, which rise 200 feet high. The lower or business portion is regularly laid out and compactly built, and in the upper portion the streets rise picturesquely one above another. Among the prominent buildings are the United States Government Building, the Central Market, St. Raphael's Cathedral (R.C.), and several other important churches.

Business Interests.—The city is the centre of the lead region of Iowa, northwestern Illinois, and southwestern Wisconsin, and contains large zinc works. In 1900 there were 460 manufacturing concerns reported, with a combined capital of \$8,117,358, employing 5,503 persons, paying \$2,012,153 in wages, and yielding products aggregating in value \$10,952,204. The principal manufactures were packed meat, lumber, foundry and machine shop products, malt liquors, bread and bakery products, carriages and wagons, millinery, and clothing. The imports of merchandise at Dubuque in the year ending 30 June 1900 aggregated in value \$40,940. In 1899 there were three national banks, with a combined capital of \$700,000 and a surplus of \$99,000, and several State, savings, and private banks.

Public Interests.—The city is the winter harbor for boats on the Upper Mississippi. In 1893 it was created the see for an archdiocese of the Roman Catholic Church. It is lighted with electricity, has an extensive waterworks system, public library, several hospitals and asylums, electric street railways, and an inclined cable road leading from the river level to the bluffs. Two gunboats for the United States navy have been built here.

Education.—In 1899 there were 18 public day schools, with 5,458 pupils enrolled, of whom 4,185 were in average daily attendance; 126 teachers; and public school property valued at \$360,000. There were over 3,500 pupils enrolled in the private and parish schools. For higher instruction there were a public high school, the academies of St. Joseph, St. Mary, St. Vincent, and the Visitation, and the State Institute of Arts and Sciences.

History.—The city was named in honor of Julien Dubuque, a French trader, who with 10 others settled here in 1788 to mine lead. This was the first settlement in what is now the State of Iowa. The settlement was abandoned after Dubuque's death in 1810, and the site was not again occupied till 1833. This last was the first permanent settlement in Iowa. Pop. (1900) 36,297.

Duc, Joseph Louis, zhō-zěf loo-ē dük, French architect: b. Paris 25 Oct. 1802; d. 22 Jan. 1879. Winning the Prix de Rome in his 23rd year, in 1840 he was chosen to assist in designing the monument in the Place de la Bastille. His chief work is the Palace of Justice in Paris, which occupied the greater part of 25 years in building, for which the Emperor Napoleon III. gave him \$20,000 as a special prize. The architect devoted the greater part of this sum to establish a prize for excellence in architecture.

For a description of the Palace of Justice see PARIS.

Du Camp, dü kăñ, **Maxime**, French writer: b. Paris 8 Feb. 1822; d. Baden-Baden 8 Feb. 1894. He wrote the history of the Paris Commune: 'The Convulsions of Paris' (1878-9), and other historical sketches: 'Egypt, Nubia, Palestine and Syria' (1852); but his greatest work is 'Paris: Its Organs, its Functions, and its Life' (1869-75). He likewise wrote some lyric poems: 'Modern Chants' (1855); 'Convictions' (1858); and several novels, among them: 'Memoirs of a Suicide' (1853); 'The Six Adventures' (1857); 'The Man with the Gold Bracelet' (1862).

Du Cange, dü kănz, or **Ducange**, SIEUR **Charles du Fresne**, or **Dufresne**, French historian and philologist: b. Amiens 18 Dec. 1620; d. Paris 23 Oct. 1688. His family name was Dufresne, and Sieur Ducange was his title as lord of his paternal estates. He was an alumnus of the college of the Jesuits in his native town and after completing his studies there took up the study of jurisprudence, and in 1631 was admitted to practice as an advocate at the bar of the parliament of Paris. Meeting with discouragement in his profession, he withdrew to his native place and there devoted himself to the historical, linguistic and philological studies which have made him illustrious as a scholar. He was indefatigable in research, and his linguistic attainments, critical acumen and various knowledge enabled him to digest and sort out of the infinite mass of material the facts of history and the points of philology which were necessary for the composition of the many solid memoirs of which he is author. And those works involved titanic labor even if we consider only the work of the pen in making "copy" for the printer; for every word was penned with his own hand. Of the long list of his printed works the two which are most enduringly important—and frequent reference to these is imperative on whosoever studied the history of the Middle Ages at its sources—are his dictionaries of the Greek and Latin languages in the period of their decline. Among other writings may be named 'Histoire de l'empire de Constantinople sous les empereurs français'; 'Historia byzantina duplici commentario illustrata'; 'Chronicon Paschale a mundo condito ad Heraclii imperatoris annum vigesimum.'

Ducange, Victor Henri Joseph Brahain, vĕk-tōr ōñ-rĕ zhō-zěf brā-hăñ, French poet and romancer: b. The Hague 24 Nov. 1783; d. Paris 15 Oct. 1833. His first stories, 'Agatha,' and 'Valentine,' were received with great favor; but for his too realistic description in 'Valentine' of the excesses of the Royalist bands, he was sent to jail for six months. Released, he was again imprisoned, ostensibly for vilifying the French Academy. Once more he offended with 'Thelene, or Love and War,' and had to take refuge in Belgium. Other novels are: 'The Confessor Doctor'; 'The Artist and the Soldier,' etc. Of his numerous plays the best and most famed is 'Thirty Years, or the Life of a Gambler.' His novels are vividly dramatic and descriptive.

Ducas, doo-kās, **Michael**, Byzantine historian of the 15th century. He was a descendant from an imperial family, and himself held a high position at the court of Constantine Palæologus, the last emperor of Constantinople. After the

conquest of that city by Mohammed II. he took refuge with the Prince of Lesbos, Dorino Gate-luzzi, and his prudence and skill succeeded in saving the independence of Lesbos for a time. It is probable that he wrote in his old age the history of the Byzantine empire. This begins with an outline of universal chronology, and does not become detailed and truly instructive till the reign of John Palæologus I., and it terminates abruptly in the middle of a sentence, at the capture of Lesbos in 1462. It is the most difficult of all the Byzantine histories, written in a barbarous style, but is judicious and impartial.

Duc'at, the name of certain gold or silver coins current in several countries, but is no longer the monetary unit in any country. It had its origin in 1140, and was formerly a favorite coin with the Dutch, and, owing to the excellence of the pieces struck, they were sought for and imitated by several other countries, and especially Russia. Ducats now everywhere circulate at a valuation, where they circulate at all, or are bought and sold simply as bullion. The following are some of the best known:

1. The gold ducat of Holland, weighing 3.494 grammes, .983 fine, value about \$2.33. 2. The gold ducat of Russia, which is of precisely the same weight, fineness, and value as the Dutch ducat. 3. The gold ducat of Austria-Hungary, weighing 3.4904 grammes, .986 fine, value \$2.34. 4. The gold ducat of Sweden, weighing 3.486 grammes, .9766 fine, value \$2.31. 5. The gold ducat of Hamburg, valued at \$1.85. 6. The silver ducat of Sicily, weight 22.943 grammes, .833 fine, value 84 cents. See COIN; NUMISMATICS.

Ducato, Cape. SEE CAPE DUCATO.

Ducatoon, dük-a-toon', or **Ducastone**, formerly a Dutch silver coin worth 3 gulden 3 stivers, or \$1.30. There were coins of the same name in Italy. In Tuscany its value was about \$1.35, in Savoy slightly more, and in Venice about 97 cents.

Duccio di Boninsegna, düch'ō dē bōn-ën-sān'yā, Italian painter, founder of the Sieneſe school: b. Siena about 1260; d. about 1320. His great work is the altar-piece of the cathedral in Siena, which, when completed was carried in a procession to the cathedral. It shows the Madonna surrounded by saints and angels; on the reverse are 26 pictures of the Passion of Christ. Two other Madonnas in Siena are also attributed to him.

Ducey, Thomas James, American Roman Catholic clergyman: b. Lismore, Ireland, 4 Feb. 1843. He came to the United States when five years old, and after his graduation at the Theological Seminary in Troy, N. Y., was ordained priest in 1868. He founded St. Leo's Church in New York in 1880 and has been its pastor ever since. In 1891 the Pope conferred on him the title of Monsignore. He has been an active champion of labor and reform.

Du Chaillu, dü shā-yü', **Paul Belloni**, American traveler: b. Paris 31 July 1835; d. St. Petersburg, Russia, 30 April 1903. He spent his youth in the French settlement on the Gaboon, on the west coast of Africa, where his father was a merchant, and received his education from the Jesuits there. In 1852 he went to the United States, of which he afterward became a naturalized citizen. In 1855 he began his first journey through western Africa, and spent

till 1859 alone among the different tribes, traveling on foot upward of 8,000 miles. He collected several gorillas, never before hunted, and rarely, if ever, before seen by any European. The result of this journey was his work: 'Explorations and Adventures in Equatorial Africa' (1861). This book contained much important information on the zoology, geography, and ethnology of parts of the continent then unknown to Europeans, and by many authorities Du Chaillu's statements were received with suspicion; but subsequent expeditions by others fully confirmed his substantial accuracy. A second expedition was made by him in 1863, an account of which, under the title 'A Journey to Ashango Land,' appeared in 1867. 'The Land of the Midnight Sun,' an account of a tour in northern Europe (1881), had a considerable success. He has also published a number of books intended for youth, and based on his travels. One of his later works is 'The Viking Age' (1889), a treatise on the ancestors of the English-speaking peoples. In addition to the works named above may be mentioned his 'Stories of the Gorilla Country' (1868); 'Wild Life Under the Equator' (1869); 'Lost in the Jungle' (1869); 'The Country of the Dwarfs' (1872); 'The Land of the Long Night' (1899); 'The World of the Great Forest' (1900); 'How Animals, Birds, Reptiles, and Insects Talk, Think, Work, and Live' (1900).

Duchâtel, dü shā-têl, **Charles Marie Tan-neguy**, COUNT, French economist and politician: b. Paris 19 Feb. 1803; d. there 6 Nov. 1867. Prior to 1830 he took an active part in editing the *Globe*, one of the leading organs of the Liberalists. He began his parliamentary career in 1832, was named secretary-general of the finances in 1833, and in 1835 was appointed to the ministry of commerce. He resigned with his colleagues in February 1836, and now became one of the most energetic leaders of the opposition. At the accession of the cabinet of Soult and Guizot in 1840 he came again into power as minister of the interior, and retained this position with but a short interruption till the revolution of 1848, after which he lived in retirement. The measures supported by him both as deputy and minister were generally of a financial character, but he also took a prominent part in the establishment of railways and telegraphs in France.

Duché, dü-shā', **Jacob**, American Episcopal clergyman: b. Philadelphia 1739; d. there January 1798. In 1759 he was ordained an assistant minister of Christ Church in Philadelphia, of which in 1775 he became rector. He was a man of brilliant talents and impressive eloquence, and at the meeting of the second congress in 1775, just after the outbreak of the War of the Revolution, made the opening prayer. He was for three months chaplain of Congress, but subsequently adopted the Royalist side. Beside several other works he wrote 'Caspipina's Letters.'

Duchesne, dü-shān, **André**, French historian: b. Touraine, Isle Bouchard, May 1584; d. 30 May 1640. History and geography were his favorite studies from his youth, and under Richelieu's ministry he was appointed royal geographer and historiographer. His most important works are: 'Histoire d'Angleterre, d'Ecosse et d'Irlande' (1614); 'Histoire des Papes jusqu'à Paul V.' (1616); 'Histoire des rois,

DUCHESS OF DEVONSHIRE — DUCK

ducs, et comtes de Bourgogne' (1619-28), and his collections of the early Norman and French histories. His industry was extraordinary; he is said to have left more than 100 folios in manuscript. He is frequently styled "The father of French history."

Duchess of Devonshire, English noblewoman, made famous by two beautiful portraits, one by Reynolds and the other by Gainsborough. The latter, the more famous of the two, shows the lady wearing a broad-brimmed hat with plumes, that has come to be known as the Gainsborough hat. The picture is in the gallery of the New British Institution, replaced in 1902, after having been concealed since 1876, when it was cut from the frame by a noted American thief, since dead.

Duchess, The, the pen-name of MARGARET WOLFE HUNGERFORD (q.v.).

Duck, a general name for birds of the family *Anatida*, but more particularly restricted to a group of genera comprising *Anas*, *Spatula*, *Dafila*, *Querquedula*, *Mareca*, *Aix*, *Aythya*, *Fuligula*, *Harelda*, *Somateria*, etc. The ducks proper are distinguished from the swans (*Cygnina*), comprised in the same family, by having shorter necks; and from the geese (*Anserina*), also of the same family, by having shorter necks, and legs less strong and placed farther back. They also subsist largely on insects and other animal food, while the geese and swans live mostly on vegetable food. The voices of the three groups are also distinctive.

The family *Anatida* is the only one of the order *Anseres* and with the flamingoes (*Phaenicoptera*) constitutes the *Chenomorpha* (q.v.). The bill is provided with marginal teeth or lamellæ, and is usually broad, flat, and covered with a soft, sensitive skin: the palate is of the desmognathous type, and the occipital region of the skull perforated with usually two fenestræ. With a very few exceptions they are strictly aquatic birds, characteristic of northern regions, where about half of the 180 known species occur. From 5 to 10 sub-families have been recognized by different authors. The simplest arrangement distinguishes the *Cygnina*, or swans; the *Anserina*, or geese; the *Anatina*, or river ducks, with the bill flattened and the hallux unlobed; the *Fuligulina*, or sea ducks, with flattened bill and lobate hallux; and the *Mergina*, or fish-eating ducks, with long, slender, and cylindrical bill, and lobed hallux. Of the last three sub-families, which include all of the ducks, about 40 species belong to the fauna of North America. The following accounts will serve to illustrate the habits and economic importance of some of the most noteworthy.

The mallard, or common wild duck (*Anas boschas*) is found throughout the northern hemisphere, except in the tropics, and breeds throughout the greater part of its range. This is the original stock of the domesticated duck, and appears to have been reclaimed at a very early period. It is found in nearly every fresh-water lake and river of the central United States, northern Europe, and Great Britain. The nest is usually placed by the side of a stream or lake, or in a marsh or bog, among close grass, reeds, and rushes, and may often contain from 12 to 16 eggs, of a dull greenish-white. The flesh of the wild duck is

held in general estimation, and various methods are resorted to in order to obtain these birds in quantities. In Picardy, France, vast numbers are taken in decoys, or ingeniously arranged netted enclosures, and sold in the Paris market, where, in one season, 30,000 francs have been paid for the produce of a single small lake. They also abound in the Fen District, Lincolnshire, England, and formerly were taken in great quantities by similar means as in Picardy. The number taken in England by means of decoys has greatly decreased, however. In the United States various simple contrivances are made use of for the capture of these wary birds. In some ponds frequented by them five or six wooden figures, called decoys, cut and painted to represent ducks, and sunk by pieces of lead nailed to the bottom, so as to float at the usual depth on the surface, are anchored in such a position as to be within easy range of a sportsman concealed among brush, etc. These attract the passing flocks, which alight, and thus expose themselves to certain destruction. In winter, when detached pieces of ice are occasionally floating in the river, some of the sportsmen on the Delaware paint their boats white, and laying themselves flat in the bottom, direct them almost imperceptibly near a flock before the ducks have distinguished them from a floating piece of ice. For this purpose low boats sunk deep in the water and known as sneak boxes are used. On land another stratagem is sometimes practised with great success. A tight hogshed is sunk in the marsh or mud near the place where ducks are accustomed to feed at low water, and where otherwise there is no shelter; the edges and top are artfully concealed with tufts of long, coarse grass, and reeds or sedge. From within this blind the sportsman watches his collecting prey, and usually commits great havoc. In China the sportsman covers his head with a calabash, pierced with eye-holes, and thus equipped wades into the water, keeping only his head above the surface, and on arriving amid a flock, seizes them by the legs, fastens them to his girdle, and thus takes as many as he wishes, without disturbing the rest.

The black duck (*Anas obscura*) is much more abundant than the mallard in eastern North America, and has a much less extensive north and south range. It breeds in the northern United States and as far north as Labrador. Like the mallard, it is properly a fresh-water duck, but during the late fall and winter frequents the salt marshes and feeds on shell-fish. Great numbers are shot over decoys and from blinds and supplied to the New York and Philadelphia markets. In this species the sexes are similar, while in the mallard the male is larger and much more brightly colored, and is designated the drake, the name duck being restricted to the female.

Musk duck, erroneously called Muscovy duck (*C. moschata*). This well-known bird is the largest of the duck kind, and approaches nearly to the size of a goose. It has obtained its name from a strong smell of musk which exhales from its body, and not because it comes from Russia, as has been supposed, since it is a native of South America. The musk ducks are tamed in great quantities in the West Indies, and are found wild in Guiana, where they nestle on the trunks of trees, close upon the water's edge.

DUCK — DUCKBILL

They feed much upon a plant called wild rice, and are difficult to approach.

Canvas-back duck (*Aythya valisineria*), a delicious duck peculiar to America, was known to the epicure long before it was described by the naturalist. We are indebted to Wilson for the first account of it. He gave it the name of the plant on which it feeds, which had been called after the celebrated Vallisneri. The canvas-back ducks arrive in the United States from their breeding grounds in the north about the middle of October, and, though common throughout the United States, their most famous assembling place is in the numerous rivers in the neighborhood of Chesapeake Bay. On the Susquehanna they are called canvas-backs, on the Potomac white-backs, and on James River shel-drakes. When they first arrive they are very lean; but from the abundance of their favorite food they become fat about November. Formerly they were sometimes found in such multitudes as to cover several acres in a compact flock, but by the use of the swivel gun and night shooting, a practice now prohibited by law, their numbers have been greatly depleted. From the great demand for these ducks and the high price they always command, various methods are employed to decoy them within gunshot. The most successful is that termed tolling, in which they are enticed to approach the shore by means of a dog properly trained. The canvas-back is constantly attended by another species, the American widgeon (*Mareca americana*), which manages to make a good subsistence from his labors. This bird is extremely fond of the tender roots of that particular species of plant on which the canvas-back feeds. The widgeon, which never dives, watches until the canvas-back rises, and before he has his eyes well opened, snatches the morsel from his mouth, and makes off.

Among other species of ducks are, *Spatula clypeata*, or shoveller, remarkable for the strange form of its bill; *Chaulelasmus strepera*, or gad-wall, which is nearly cosmopolitan but more rare in America than in Europe; *Dafila acuta*, pintail or sprigtail, remarkable for the form of its tail, abundant in both hemispheres; and *Aix sponsa*, summer or wood duck, not more remarkable for its great beauty, in which it stands pre-eminent, than for its habit of nesting in hollow trees. The sub-genus *Nettion* includes the several species of teal, and *Somateria*, the eider ducks. *Oidemia fusca*, velvet duck, found in both hemispheres, has a rank and fishy flavor and is therefore seldom sought after; and *O. americana*, the scoter found in America. These, with a few other birds of the same fishy flavor, are exempted from the interdict which forbids Roman Catholics the use of animal food on certain days, on the supposition of their being cold-blooded and partaking of the nature of fish. *A. americana*, the red-head, and *A. ferina*, the European pochard, approach very near to the canvas-back in appearance and habits. *Fuligula marila*, scaup-duck or blue-bill, is a well-known and common species in both continents. *Clangula hyemalis*, long-tailed duck or old-wife, common to both continents, is remarkable for the long and slender middle feathers of its tail; and *Clangula histrionica*, harlequin-duck, a magnificent species found on both continents, derives its name from the singularity of its markings;

along the coast of New England it is called "the lord."

The duck bred for domestic purposes is derived chiefly from the mallard, crossed in some cases, with either the gadwall, the musk, or the black duck. One of the best-known and most esteemed varieties of domestic duck is the Aylesbury duck, so named from the town in Buckinghamshire, England, where they are largely raised for the London market. They are noted for their size, fine white and downy feathers, and delicately flavored flesh. They are easily raised and very productive, being early layers and accurate hatchers.

Additional information will be found in the articles, canvas-back, dusky duck, eider, gadwall, golden-eye, long-tailed duck, mallard, red-headed duck, ruddy duck, scaup, scoter, shoveller, shel-drake, teal, and widgeon. Consult also: Baird, Brewer, and Ridgway, 'Water-birds of North America'; Salvadori, 'Catalogue of Ducks of the British Museum'; Darwin, 'Animals and Plants Under Domestication'; and Sanford, Bishop, and Van Dyke, 'The Water Fowl Family.'

Duck, a species of strong linen cloth, lighter and finer than canvas, used for small sails and for men's wear. Duck is usually white or unbleached, but is sometimes made in plain colors.

Duck Ant. See WHITE ANT; TERMITE.

Duckbill, or **Platypus**, an aquatic egg-laying mammal (*Ornithorhynchus paradoxus*) native to the sluggish rivers of Australia, Papua, and Tasmania. Its entire length from tip of bill to tip of tail is usually between 18 and 20 inches. Its body is rather long, and covered with glossy blackish hair, close to the roots of which is a soft waterproof under-coat of fur similar to that of the beaver. The head is rounded; the eyes are small and bright; and there are no external ears, despite which fact, the creature's hearing is very acute. The feature which gives its name to the animal is the duck-like bill which is the substitute for the muzzle of other animals. This bill is formed of the elongated jaw-bones, covered with a highly sensitive, smooth skin; when the teeth are shed, as they are at maturity, horny plates, developed on both jaws, take their place and do their work. The duckbill is well adapted to its aquatic and burrowing habits. Its legs are short, its feet webbed and furnished with sharp claws. In the fore-feet the web extends far beyond the claws, but can be folded back out of their way. The tail is broad and flattened, covered with coarse hair, and nearly naked on the other side. In habits the duckbill is almost entirely aquatic, spending its life in or near rivers; but carefully avoiding stagnant or brackish waters. In swimming it propels itself mainly by the aid of its fore-feet; and it dives well. It is gregarious; and sometimes congregates in considerable numbers; but is so shy that unless one watches quietly at evening he will not see a single member of the company. The least hint of danger sends them all to the bottom. The food is often collected in the large cheek pouches, where it can be stored and conveniently carried home by the animal. Each pair lives in a burrow in the bank—a gallery or passageway, widened out at its interior extremity into a chamber where the occupants sleep by day, and whither the

5. Shoveler (*Anas clypeata*).
6. Bernicle Goose (*Branta bernicla*).

female retires to produce her young. She lays few eggs in her bed of dry grass; often only one, and hatches her young in a comparatively short time. When born they are naked and blind. The eggs are white, about three fourths of an inch long, by one half inch wide; and unlike birds' eggs, have a soft and somewhat flexible shell; though, in their having a large amount of food-yolk, they resemble birds' eggs. The food consists of aquatic insects, crustaceans and worms, which live in the water or in the mud, and which are found not only by the tactile sense, in the bill, but also by the unusually keen sense of smell. The voice is like the growl of an angry puppy, but the disposition is quiet and gentle.

Duck'ett, Sir Floyd, English archæologist: b. 1811; d. 13 May 1902. His 'Technological Military Dictionary' published (1848) in German, English and French, brought him gold medals from Austria, Prussia and France. His 'Reminiscences' appeared in 1894.

Ducking Stool, also known as "cucking stool" and "castigatory," a chair in which common scolds were formerly securely fastened, to receive the punishment of being ducked in water. The culprit was placed in the chair with arms drawn backward; a bar was placed across the back and inside the elbows, while another bar held the body upright; in this uncomfortable position the prisoner was securely tied with cords. The persons appointed to carry out the punishment, by raising their end of the beam, caused the unfortunate culprit to go overhead into the water. By pulling down their end with a chain the victim was once more brought to the surface. The ducking stool was generally used in Great Britain from the 15th to the 18th century, and one case was known as late as 1806.

Duckweed, a genus of plants, by some botanists made the type of the small order *Lemnaceæ*. The species are small plants which float on the surface of stagnant ponds or slow running streams, and are eaten by ducks and geese. The fronds take the place both of the stems and leaves, and are usually of a bright green color. The flowers arise from a slit just below the margin of the frond. The family comprises the very smallest of the flowering plants, and contains three genera, all of which are to be found in North America. Of the 26 species in the family, the most numerous in the United States are those of the genus *Lemna*, of which five are found. The other genera are *Spirodela* and *Wolffia*.

Duckworth, Sir John Thomas, English admiral: b. Leatherhead, Surrey, 28 Feb. 1748; d. Devonport, England, 31 Aug. 1817. Between 1776 and 1779 he served in America. He distinguished himself in 1794 in the great naval victory gained by Lord Howe off Ushant, and in 1798, under Earl St. Vincent, acquired new fame at the capture of Minorca. Some years later he set out in pursuit of a French fleet which had sailed to the West Indies to succor St. Domingo. He came up with it and succeeded in capturing an 80 and three 74 gun ships. For this service he received the thanks of both houses of Parliament, and was presented by the city of London with its freedom and a sword of the value of 200 guineas; and by the assembly of Jamaica with thanks and a sword of the

value of 1,000 guineas. In 1807, having been appointed to watch the Turkish fleet, he forced the passage of the Dardanelles. Between 1810 and 1815 he was governor of Newfoundland.

Duclerc, Charles Théodore Eugene, shārl tā-ō-dōr è-zhān dü-klārċ, French statesman: b. Bagnères-de-Bigorre, France, 9 Nov. 1812; d. Paris 21 July 1888. He took an active part in the Revolution of 1848; was a speaker in the Constituent Assembly, and minister of finance for a time. He was elected vice-president of the National Assembly in 1875; chosen a senator for life in the same year; and became premier in 1882.

Duclos, Charles Pinot, shārl pē-nō dü-klō French historian and novelist: b. Dinant, Britanny, 12 Feb. 1704; d. Paris 26 March 1772. He was chosen member of the Academy of Inscriptions in 1739, and in 1747 member of the French Academy, of which he was afterward appointed permanent secretary. In 1750 he was appointed to succeed Voltaire as historiographer of France. Among the best of his novels are 'Confessions du Comte de Bellipse' (1741). His 'Considérations sur les Mœurs de ce Siècle' are full of striking sketches of character and deep knowledge of human nature. His 'History of Louis XI.' is esteemed, but shows the hand of the novelist. Of more value are his 'Mémoires secrets sur les Règnes de Louis XIV. et XV.' This work was composed in his character of historiographer. He also distinguished himself in his 'Remarques sur la Grammaire générale de Port Royal' as a grammarian.

Ducornet, Louis César Joseph, loo-ē sâ-zār zhō-zéf dü kōr-nā, French artist: b. Lille 10 Jan. 1806; d. Paris 27 April 1856. Born without arms, he learned in early childhood to use his feet for hands, and when 13 years old showed such skill in drawing with his toes that Watteau received him as a pupil in the Lille Academy of Design. There his ambition to become a painter received wholesome encouragement. At the end of three years he took the first prize for a drawing of the human figure from life, and received a pension from the city which the government subsequently increased. He then went to Paris for more advanced study, painted 'The Parting of Hector and Andromache' (1828), and presented it to his native city. He continued painting till within a few weeks of his death. His last work of note, 'Edith Finding the Body of Harold,' was ordered by Napoleon III. and exhibited in 1855.

Ductilim'eter, an instrument invented by M. Regnier for ascertaining the relative ductility of metals. The metal to be tested is subjected to the action of blows from a mass of iron of given weight attached to a lever, and the effect produced is shown upon a graduated arc.

Ductil'ity, the quality of adaptedness of solid bodies, particularly metals which render them capable of being extended by drawing; as malleability is for being beaten into leaves. The order of metals in these two respects is as follows: ductility—gold, silver, platinum, iron, copper, zinc, tin, lead, and nickel; malleability—gold, silver, copper, tin, platinum, lead, zinc, iron, and nickel. The less ductile soft metals, such as magnesium, which cannot be drawn, are converted into wire by the process of press-

ing or squirting. When glass is subjected to a sufficient degree of heat it can be managed like soft wax, and may be drawn out into threads exceedingly long and fine. Ordinary spinners do not form their threads of silk, flax, or the like, with half the ease and expedition the glass-spinners do threads of this ordinarily brittle matter. Some of them are made into plumes of filaments much finer than hair, which bend and wave, like hair, with every wind. Two workmen are employed in making them: the first holds one end of a piece of glass over a flame, and when the heat has softened it the second operator applies a glass hook and draws out a thread of glass, which still adheres to the mass; then fitting his hook on the circumference of a wheel about $2\frac{1}{2}$ feet in diameter, he turns the wheel as fast as he pleases till it is covered with a skein of glass thread. The parts, as they recede from the flame, by gradually cooling become more cohesive, the parts nearest the fire are least cohesive, and consequently must give way to the effort made to draw them toward the wheel. These threads are commonly of a flat, oval shape, being three or four times as broad as thick; some of them seem scarcely bigger than the thread of a silk-worm, and are surprisingly flexible. If the two ends of such threads are knotted together they may be drawn and bent till the aperture or space in the middle of the knot does not exceed one fourth of a line or one forty-eighth of an inch in diameter. The flexibility of glass increases in proportion to the fineness of the threads; and, probably, had we the art of drawing threads as fine as those of a spider's web, we might weave stuffs and cloths of them.

Duda, Dudka, or Dudotka, the name of a singular wooden wind-instrument used in some parts of Russia, consisting of two tubes of different length, each with three sound-holes and having a single mouth-piece, thus somewhat resembling the double flute of the ancients.

Dude, a modern word coined as a slang expression (but now, by constant use, dignified into semi-respectability) to designate a brainless fop, whose whole business and aim in life are like those of Carlyle's dandy — to wear clothes. The term is said to have originated in London about 1882, at the time of the so-called "æsthetic" movement in dress and manners among the ultra-society folk.

Du Deffand, Madame. See **DEFFAND**.

Dudevant, dūd-vān, Madame. See **SAND, GEORGE**.

Dudley, Benjamin Winslow, American surgeon: b. Spottsylvania County, Va., 20 April 1785; d. Lexington, Ky., 20 Jan. 1870. He received his medical education at the medical school of the University of Pennsylvania in Philadelphia, and in 1810 went to Europe for the further study of his profession, where he remained as the pupil of Sir Astley Cooper, Abernethy and others, in London, and Larrey, Dubois, and Boyer till 1814. On his return he established himself in Lexington, Ky., in July 1814, and on the day of commencing practice performed two difficult operations, that for strangulated hernia, and trephining in a case of fractured skull. He became especially noted for his success as a lithotomist.

Dudley, Charles Edward, American politician: b. Johnson Hall, Staffordshire, England, 23 May 1780; d. Albany, N. Y., 23 Jan. 1841. After the death of his father he came with his mother to Newport, R. I., in 1784. In 1811 he removed to Albany. He was State senator 1820-5, mayor of Albany in 1821 and 1828, and in 1829 was appointed United States senator to serve out the unexpired term of Martin Van Buren. He was particularly fond of astronomical science, and his widow in 1856 founded the Dudley Observatory at Albany.

Dudley, Sir Edmund, English politician: b. about 1462; d. London 18 Aug. 1510. He was an instrument of Henry VII. in the arbitrary acts of extortion by the revival of obsolete statutes and other unjust measures practised during the latter years of his reign. On the accession of Henry VIII. he was arrested for high treason and perished on the scaffold with his associate, Sir Richard Empson.

Dudley, Lord Guildford, English noble: d. London 12 Feb. 1554. He was a son of John, Duke of Northumberland, and was married in 1553 to Lady Jane Grey, whose claim to the throne the Duke intended to assert on the death of Edward VI. On the failure of the plot Lord Guildford was condemned to death, but the sentence was not carried into effect till the insurrection of Wyatt induced Mary to order his immediate execution.

Dudley, Sir Henry Bate, English clergyman and author: b. Fenny Compton, Warwickshire, 25 Aug. 1745; d. 1. Feb. 1824. Not finding the emoluments of his curacy sufficient for his convivial tastes, he turned his attention to literature, established several newspapers, among others the *Morning Post* and *Morning Herald*, and also wrote some dramatic works. His original name was Henry Bate, but in accordance with the will of a relative who left him some property, he assumed in 1784 that of Dudley. He was made a baronet in 1812.

Dudley, John, Duke of Northumberland and Earl of Warwick: b. 1502; d. London 22 Aug. 1553. He was a son of Sir Edmund Dudley (q.v.). Under Edward VI. he manifested the most insatiable ambition and obtained vast accessions of honors, power, and emoluments. The illness of the king, over whom he had gained complete ascendancy, aroused his fears, and he endeavored to strengthen his interest by marrying his son, Lord Guildford Dudley, to Lady Jane Grey, descended from the younger sister of Henry VIII., and persuaded Edward to settle the crown on his kinswoman by will, to the exclusion of the Princesses Mary and Elizabeth. The death of the king, the abortive attempts to place Lady Jane Grey on the throne and the ruin of all those concerned in the scheme are among the most familiar events in the annals of England.

Dudley, Joseph, American colonial governor of the province: b. 23 Sept. 1647; d. Roxbury 2 April 1720. He was a son of Thomas Dudley (q.v.). He was graduated at Harvard College in 1665, served in the Indian war in 1675, was sent to England as agent for the province in 1682, appointed president of New England in 1686, superseded by Andros a few months later, and made chief justice. He was chief justice of New York from 1690 to 1693.

DUDLEY — DUE PROCESS OF LAW

then eight years lieutenant-governor of the isle of Wight, and finally governor of Massachusetts from 1702 to 1715.

Dudley, Paul, American colonial chief justice: b. 3 Sept. 1675; d. Roxbury, Mass., 21 Jan. 1751. He was a son of Joseph Dudley (q.v.). He was graduated at Harvard College in 1690, and afterward studied law in London. He returned to Massachusetts in 1702, with the commission of attorney-general; in 1718 was appointed judge, and in 1745 became chief justice. By his will he bequeathed £100 to Harvard College, the interest of which was to be applied to the support of an annual lecture. This lecture is called from its founder the *Dudleian* lecture, and, according to his direction, is delivered on one of four subjects which are treated of in succession.

Dudley, Plimmon Henry, American metallurgical engineer: b. Freedom, Ohio, 21 May 1843. He was chief engineer of Akron, Ohio, 1868-72, and subsequently invented the dynamograph (1874), the track indicator (1880), and the streamatograph for obtaining and registering stresses in rails.

Dudley, Robert, EARL OF LEICESTER, English courtier: b. 24 June 1532 or 1533; d. Cornbury, Oxfordshire, 4 Sept. 1588. He was a son of John Dudley, Duke of Northumberland, and though involved in the criminal designs of his father, and included in the sentence of attainder passed against him on the accession of Mary, was pardoned and employed by that queen. After Elizabeth ascended the throne Dudley soon acquired the distinction of being her favorite. Offices, honors, and wealth were showered on him with an unsparing hand. He was appointed master of the horse, knight of the Garter, and privy counselor; and received grants of the princely domains of Kenilworth, Denbigh, and Chirk Castle. In 1564 he was created Baron Denbigh and Earl of Leicester, and was the same year elected chancellor of Oxford University, having previously been chosen to the same office at Cambridge. In 1588 he was appointed captain-general of the queen's forces to resist the Armada.

Dudley, Thomas, American colonial governor: b. Northampton, England, 1576; d. Roxbury, Mass., 31 July 1652. He came to Massachusetts in 1630 with the commission of deputy governor, and he was afterward chosen governor in the years 1634, 1640, 1645, and 1650. He was a man of integrity and piety, though intolerant, like most of his generation. See Jones, 'Life and Work of Thomas Dudley' (1899).

Dudley, Thomas Underwood, American Protestant Episcopal bishop: b. Richmond, Va., 26 Sept. 1837; d. New York 22 Jan. 1904. He was graduated from the University of Virginia in 1858, and served in the Confederate army during the Civil War, attaining the rank of major. Completing his studies at the Virginia Theological Seminary he was ordained in 1868 and after filling the rectorship of Christ Church, Baltimore, was made assistant bishop of Kentucky in 1875, and became bishop of the diocese 1884. He has published: 'A Wise Discrimination of the Church's Need.'

Dudley, William Lofland, American scientist: b. Covington, Ky., 16 April 1859. He was graduated at the University of Cincinnati in

1880, and from 1880 to 1886 was professor of chemistry and toxicology at Miami College. His iridium process for electroplating is very successful. Since 1886 he has been professor of chemistry at Vanderbilt University, being also dean of the medical department.

Dudley, William Russel, American botanist: b. Guilford, Conn., 1 March 1849. He was graduated at Cornell in 1874, becoming assistant professor of botany there in 1876. Since 1892 he has been professor of botany at Leland Stanford, Jr., University. He is the author of 'Cayuga Flora'; and 'Manual of Histology.'

Dudley, England, city, parliamentary borough in Worcestershire. Among its institutions are a mechanics' institute and a geological society, with a museum rich in mineral specimens, and a free library and school of art. It is situated in the midst of the "black country," with extensive coal fields surrounding it. The principal manufactures are articles made from iron and also flint-glass. There are here the remains of a castle, said to have been founded in the 8th century by a Saxon prince called Dudo or Dud, who has given the town its name. Pop. (of parliamentary borough) 97,000.

Dudley Diamond, The, a diamond found in South Africa in 1868, weighing originally 89 carats, but reduced to half that weight in cutting. It receives its name from its owner, the Earl of Dudley, who bought it for \$150,000. See DIAMOND.

Dudweiler, dood'vî-lër, Germany, town in Rhenish Prussia, about 45 miles northeast of Metz. The coal fields near by are a source of wealth to the town; and the chief manufactures are iron works and potteries. In the vicinity is Brennender Berg (Burning Mountain), a mountain composed largely of coal which has been burning for over 200 years. Pop. 16,514.

Due Process of Law, law in its regular course of administration through courts of justice. This term, due process of law, which occurs in the amendments to the Constitution of the United States (Art. V.), and in the constitutions of nearly all of the States, is considered by Coke as equivalent to the phrase "law of the land" (used in *Magna Charta*, ch. 29), and is said by him to denote "indictment or presentment of good and lawful men." Coke Inst. 50. Due process of law includes notice, hearing, and judgment. The constitutions of the various States and the Federal Constitution contain no description of those processes which it was intended to allow or forbid. As a general rule they do not even declare what principles are to be applied to ascertain whether it be due process. It is manifest that it was not left to the legislative power to enact any process which might be devised. As used in the Constitution of the United States, the article is a restraint on the legislative as well as on the executive and judicial powers of the government, and cannot be so construed as to leave Congress free to make any process, "due process of law," by its mere will. It has been held that the amendment to the Constitution of the United States does nothing more than declare a great common law principle applicable to all governments, both State and Federal, which has existed from the time of *Magna Charta*. It was held by the Supreme Court of the United States in *Murray v. Hoboken Co.*, 18 How. 272,

DUEL

that the words "due process of law" were undoubtedly intended to convey the same meaning as the words "law of the land" in Magna Charta. Due process of law ordinarily implies and includes a complainant, a defendant and a judge, regular allegations, an opportunity to answer, and a trial according to some settled course of judicial proceeding. When applied to proceedings in criminal cases, the expression "due process of law," or the "law of the land," means that no person shall be deprived of life, liberty, property, or privileges, without indictment or presentment by "good and lawful men," selected, organized, and qualified in accordance with some pre-existing law, and a trial by a court of justice, according to the regular and established course of judicial proceedings. It is to be regretted, however, that the constitutional meaning or value of the phrase "due process of law" remains to-day without that satisfactory precision of definition which judicial decisions have given to nearly all the guarantees of personal rights found in the constitutions of the several States and of the United States.

Duel (from *duellum*, derived from *duo*) is a combat between two, at a time and place appointed in consequence of a challenge, and so is distinguished from an encounter taking place without any previous arrangement. The custom of dueling was derived from the Germans, Danes, and Franks, who carried the practice of the judicial combat so far that none were excused except women, sick people, cripples, and such as were over 60 years of age. Even ecclesiastics and monks were obliged to maintain their controversies by a champion in arms; and this singular species of jurisprudence was not confined to criminal accusations, but the titles to estates were decided in the same manner. At length, however, this mode of trial was limited to those accusations of capital offenses in which there was no other testimony, and in which common fame pronounced the accused party to be guilty. The party vanquished was punished by hanging, beheading, or mutilation of members. A judicial combat was authorized by Gundebald, king of the Burgundians, as early as 501 A.D. The practice of trying rights to land, as well as the guilt or innocence of an accused party, by combat under judicial authority, very naturally suggested the decision of personal quarrels in the same way, and all cases in which there was no adequate redress provided in the ordinary tribunals.

The example of Francis I. of France and Charles V. of Spain gave a sanction to this mode of arbitration. On the breaking up of the treaty between these sovereigns and the declaration of war by the French and English heralds at the court of Charles, 2 Jan. 1528, the emperor, in replying to the declaration of the French monarch, desired the herald to acquaint his sovereign that he would henceforth consider him not only as a base violator of public faith, but as a stranger to the honor and integrity becoming a gentleman. On receiving this message Francis immediately sent back the herald with a cartel of defiance, gave the emperor the lie in form, challenged him to single combat, and required him to appoint the time, place, and weapons. Charles accepted the challenge; but after many messages concerning the arrangements for the combat, accompanied with mutual reproaches bordering on the most indecent scurrility, all

thoughts of the duel were given up. But this affair, though it thus terminated without any rencounter, is supposed to have had a great influence in producing an important change in manners all over Europe. Upon every insult or injury which seemed to touch his honor a gentleman thought himself entitled to draw his sword, and to call on his adversary to give him satisfaction. Dueling raged with the greatest violence in France, where it is calculated that 6,000 persons fell in duels during 10 years of the reign of Henry IV. His celebrated minister, Sully, remonstrated against the practice; but the king connived at it, supposing that it tended to maintain a military spirit among his people. But afterward, in 1602, he issued a very severe decree against it, and declared it to be punishable with death; and at the same time commanded any person who had suffered wrong or received an insult to submit his case to the governor of the province, in order that it might be considered by a tribunal consisting of the constables and marshals of France. This decree, however, accompanied by the institution of a tribunal of honor, did not put an end to duels in France. Richelieu was firm in carrying out all edicts by which he hoped to check the power of the nobility, and accordingly insisted on the strict observance of those against duels. Under his ministry the Count of Bouteville-Montmorency suffered death in 1627 for having violated a decree of the French parliament against dueling. This had for a time the effect of deterring others from engaging in this practice. During the minority of Louis XIV. the law was more feebly administered, and more than 4,000 nobles are said to have lost their lives in duels. With the revolution of 1789 commenced the period of legal impunity for duels, and a new class of duels became common, those, namely, between men engaged in politics. Bills, with a view to put down the practice, were brought forward in the chambers in 1829 and 1830, and a similar proposal was made to the Council of State in 1832; but they were not accepted. At last, in 1837, the court of cassation determined to follow a new law with regard to duels, and protesting against the practice in the name of morality and law, it decided that in case of death or injury resulting from a duel, the principal parties and the seconds should be proceeded against and punished in accordance with the general provisions of the *code pénal*. The French courts, however, reserve to themselves a discretionary power in dealing with cases of dueling, and the practice is by no means yet obsolete in France.

Single combats are said to have been introduced into England by the Normans. In the time of chivalry numerous single combats took place in England, which, in the proper sense of the term, can scarcely be called duels. It may be said that the duel, strictly so called, was introduced into England about the same time that it became common in France, such was the contagion of the example of Francis I. and Charles V. In the reign of James I. of England there were numerous cases of dueling, the most celebrated of which is that in which Lord Bruce and Lord Sackville (afterward Lord Dorset) were the principals, and in which the former was killed. Cromwell was an enemy of the duel, and during the protectorate there was a cessation of the practice. It came again into vogue, however, after the Restoration, thanks

chiefly to the French ideas that then inundated the court of St. James. Some of the duels of that epoch are in perfect accord with the loose morality then prevalent. An instance of this is the duel in which the Duke of Buckingham killed the Earl of Shrewsbury, while the wife of the latter, the cause of the duel, who had accompanied the Duke to the ground, witnessed the encounter in the dress of a page. A striking thing is that as society became more polished in England, duels became more frequent. They were never more numerous than in the reign of George III. Among the principals in the fatal duels of this period were Charles James Fox, Sheridan, Pitt, Canning, Castlereagh, the Duke of York, the Duke of Richmond, and Lord Camelford. The last-mentioned was the most notorious duelist of his time, and was himself killed in a duel in 1804. Of all the duels which took place during the reigns of George IV., William IV., and Queen Victoria, the most celebrated is that which was fought between the Duke of Wellington and Lord Winchelsea in 1829, the cause of which was certain animadversions which Lord Winchelsea had passed on the Duke's conduct in connection with the Catholic Emancipation Bill. The duel passed off without any injury being done to either of the parties engaged. The Duke of Wellington missed his aim, whereupon Lord Winchelsea fired into the air and apologized. Since that time the practice may almost be said to have become extinct in England. Even in the army dueling is now rare, since the offense is now one for which any person concerned in it may be tried by court-martial.

In Germany the practice of dueling is not yet extinct. Indeed in the army it is recognized by law as having a certain defined position. It is still also not uncommon at the German universities, though the duels of the students are seldom serious affairs, being rather fencing matches with sharp weapons than duels proper. The combatants are generally padded all over the body except the face and sword-arm.

Dueling has been known in the United States from the very beginning of their settlement, the first duel taking place in 1621, at Plymouth, between two serving men. In 1728, a young man named Woodbridge was killed in a duel on Boston Common, by another young man named Phillips. They fought without seconds, in the night time, and with swords. Aided by some of his friends, Phillips got on board a man-of-war and escaped to France, where he died a year afterward. There were few duels in the Revolution, the most noted being those between Gen. C. Lee and Col. John Laurens, in which the former was wounded, and between Gens. Cadwallacer and Conway, in 1778, in which the latter received a shot in the head from which he recovered. Button Gwinnett, one of the signers of the Declaration of Independence, from Georgia, was killed in a duel with Gen. McIntosh, in May 1777. In 1785 Capt. Gunn challenged Gen. Greene twice, both being citizens of Georgia, and threatened a personal assault when the latter refused to meet him. Greene wrote to Washington, acknowledging that if he thought his honor or reputation would suffer from his refusal he would accept the challenge. He was especially concerned as to the effect of his conduct on the minds of military men, and admitted his regard for the opinion of the world. Wash-

ington approved of his course in the most decisive terms, not on moral grounds, but because a commanding officer is not amenable to private calls for the discharge of his public duty.

Alexander Hamilton was killed in a duel with Aaron Burr in 1804, the latter being Vice-President, and the former the greatest leader of the opposition. This duel is always allowed the first place in the history of American private combats. That which stands next is the duel between Cpts. Barron and Decatur, the latter being killed, and Barron severely wounded. Henry Clay and John Randolph fought in 1826, and Col. Benton, in closing his account of the fight, says: "Certainly dueling is bad, and has been put down, but not quite so bad as its substitute—revolvers, bowie knives, blackguarding, and street assassinations under the pretext of self-defense." Gen. Jackson killed M. Dickinson in a duel, and was engaged in other "affairs." Col. Benton killed a Mr. Lucas, and had other duels. In 1841 Mr. Clay was on the eve of fighting with Col. King, then a senator from Alabama, and elected Vice-President in 1852. Mr. Cilley of Maine fought with Mr. Graves of Kentucky in 1838, near Washington, and the former was killed. This duel caused nearly as much excitement as that between Hamilton and Burr. Both parties were members of Congress. Duels have been numerous in California, notably the combat between Terry and Broderick. Formerly they were very common in the United States navy, and valuable lives were lost. It is related of Richard Somers, who perished in the *Intrepid*, and who is said to have been a mild man, that he fought three duels in one day. In 1830 President Jackson caused the names of four officers to be struck from the navy roll because they had been engaged in a duel. Since the Civil War stringent laws have been passed in all the States against dueling and the practice has become obsolete in this country.

Bibliography.—Douglas, 'Duelling Days in the Army' (1887); Massi, 'History of Duelling in All Countries' (1880); Milligen, 'History of Duelling' (1841); Steinmetz, 'The Romance of Duelling' (1868); Truman, 'The Field of Honor' (1884).

Duer, dū'ér, John, American jurist: b. Albany, N. Y., 7 Oct. 1782; d. Staten Island 8 Aug. 1858. He commenced the practice of law in Orange County, N. Y., whence about 1820 he removed to the city of New York, where he resided until his death. In 1825 he was appointed one of the commissioners to revise the statute law of the State, and in 1849 was elected a justice of the superior court of New York, a position which he filled until his death. He published: 'Lecture on the Law of Representations in Marine Insurance' (1845); 'Law and Practice of Marine Insurance' (2 vols. 8vo, 1845-6), which has become a standard authority in the United States.

Duer, William Alexander, American jurist: b. Rhinebeck, Dutchess County, N. Y., 8 Sept. 1780; d. New York 31 May 1858. He was a brother of John Duer (q.v.). He was admitted to the bar in 1802, and between 1814 and 1820 was a member of the State assembly, taking a prominent part in the debates on the establishment of canals and other important questions. In 1822 he was appointed judge of the supreme court in the third circuit, an office which he held

until the close of 1829, when he was elected president of Columbia College. He retired from this post in 1842. He was the author of a treatise on the 'Constitutional Jurisprudence of the United States.'

Duero. See **Douro**.

Duez, Ernest, ér nâ dü-a, French painter: b. Paris 8 March 1843; d. there 5 April 1896. He was a pupil of Pils, and his paintings include: 'The Honeymoon'; 'Splendor and Misery'; 'St. Cuthbert'; 'Evening in Villerville'; 'The Pont-Neuf'; and 'In Summer.'

Dufaure, Jules Armand Stanislas, zhüäl är-män stän-ê-lä dü-för, French orator and statesman: b. Saujon, France, 4 Dec. 1798; d. Paris 28 June 1881. He practised law at Bordeaux; entered the Chamber of Deputies in 1834, and became an influential leader of the Liberal party. Under the republic he was minister of the interior, but was driven from the public service by the *coup d'état* of 1851, and for the next 20 years devoted himself closely to his bar practice and pamphlet writing. Under the government of Thiers he acted as minister of justice; and in 1876, and again from 1877 to 1879, he was head of the cabinet.

Duff, Alexander, Scottish missionary: b. Perthshire 26 April 1806; d. Edinburgh 12 Feb. 1878. He set out in 1829 for India as the first Church of Scotland missionary to that country. He opened a school in Calcutta in which he sought to teach not only the doctrines of Christianity, but also the English language and the science and learning of Europe. He subsequently assisted in founding the University of Calcutta. His chief writings are: 'The Church of Scotland's India Mission' (1835); 'Vindication of the Church of Scotland's India Mission' (1837); 'India and India Missions' (1840); 'The Jesuits' (1845); 'The Indian Mutiny: Its Causes and Results' (1858).

Duff, Edward Gordon, English librarian: b. 16 Feb. 1863. He was educated at Cheltenham College and Oxford, and was librarian of the John Rylands Library, Manchester, 1893-1900. He was Sanders reader in bibliography in Cambridge University 1898-9, and 1902-3. He has published: 'Early Printed Books' (1893); 'Early English Printing' (1896); 'The Printers, Stationers, and Bookbinders of London' (1899); 'William Caxton' (1902).

Duff, Mary Ann Dyke, actress: b. London, England, 1794; d. New York 1857. She made her first appearance at the age of 14, and two years later, having married an actor named Duff, in the meantime, came to America, appearing as Juliet in Boston. With the exception of a short visit to England in 1828, the rest of her career was in America, where she appeared with the leading actors of the day in the tragedy roles of the stage. The elder Booth declared her to be the best actress in the world. Her last public appearance was in New Orleans in 1838. She married a Mr. Seaver of New Orleans.

Duff, Sir Mountstuart Elphinstone Grant, English writer and politician: b. Eden, Aberdeenshire, 21 Feb. 1829; d. London, 12 Jan. 1906. He was educated at Balliol College, Oxford, was called to the bar at the Inner Temple in 1854, and in 1857 entered the House of Commons, as a Liberal. From 1868 till 1874 he held the

office of under-secretary for India under Mr. Gladstone, and in that statesman's second ministry he was under-secretary for the colonies from 1880 till his appointment in 1881 as governor of Madras. His tenure of this important office was very successful, and ended with his resignation in 1886. From 1889 till 1893 he was president of the Royal Geographical Society. His published works include: 'Studies in European Politics' (1866); 'A Political Survey' (1868); 'Elgin Speeches' (1871); 'Notes of an Indian Journey' (1876); 'Miscellanies, Political and Literary' (1879); 'Memoir of Sir Henry Sumner Maine' (1892); 'Ernest Renan' (1893); and 'Notes from a Diary' (1897-8-9-1900).

Dufferin (düf'ér-in) and Ava, ä'vä, Frederick Temple Hamilton-Temple Blackwood, MARQUIS OF, Irish diplomatist and author: b. Ireland 21 June 1826; d. Clanboye, Ireland, 12 Feb. 1902. He first distinguished himself by contributions to literature, and published the popular 'Letters from High Latitudes' in 1859. He was successively under-secretary for India 1864-6, and for war 1866; was chancellor of the Duchy of Lancaster 1868-72; in 1871 was created an earl; and was governor-general of Canada 1872-8. His brilliant administration was remarkable for the wonderful development of the province of Manitoba. From 1879 to 1881 he was ambassador at St. Petersburg, whence he was transferred to Constantinople. In 1884 he succeeded Lord Ripon as viceroy of India, resigning in 1888. Lord Dufferin's tenure of office was made memorable by measures for strengthening the Indian frontier; by the various attempts to delimit the Afghan frontier; and, above, all, by the annexation of Upper Burma in December 1885. He became successively ambassador at Rome, marquis (1888), and ambassador to France (1891). In addition to the volume named he published: 'Irish Emigration and the Tenure of Land in Ireland' (1867); 'Speeches and Addresses' (1882); 'Speeches Delivered in India' (1890). His mother, Helen Selina Sheridan (1807-67) was the author of 'The Emigrant's Farewell'; 'O Bay of Dublin'; and other touching songs.

Duffield, George, American Presbyterian clergyman: b. Strasburg, Pa., 4 July 1794; d. Detroit, Mich., 26 June 1869. He held prominent Presbyterian pastorates in Philadelphia, New York, and Detroit, and was active as a leader of the "New School" Presbyterians.

Duffield, George, American Presbyterian clergyman and hymn writer: b. Carlisle, Pa., 12 Sept. 1818; d. Bloomfield, N. J., 6 July 1888. He was a son of the preceding. He was graduated at Yale in 1837, and at Union Theological Seminary, N. Y., in 1840. He held various Presbyterian pastorates, and wrote the popular hymns 'Blest Saviour, Thee I Love' (1851); and 'Stand Up, Stand Up for Jesus' (1858).

Duffield, John Thomas, American mathematician: b. McConnellsburg, Pa., 19 Feb. 1823; d. Princeton, N. J., 10 April 1901. He was graduated at Princeton in 1841, and at the Theological Seminary there in 1844. At that college he was successively tutor in Greek 1845, adjunct professor of mathematics 1847, and professor of mathematics in 1856, which last post he held for several years. Among his scientific writings are: 'The Discovery of Gravitation'; 'The Philosophy of Mathematics' (1867).

DUFFIELD — DUGONG

Duffield, Samuel Augustus Willoughby, American Presbyterian clergyman and poet: b. Brooklyn, N. Y., 24 Sept. 1843; d. Bloomfield, N. J., 12 May 1887. He was graduated at Yale in 1863, and from 1882 till his death preached at Bloomfield, N. J. Among his writings are: 'English Hymns, Their Authors and History' (1886); 'Latin Hymn-writers and Their Hymns' (1889).

Duffield, William Ward, American civil engineer: b. Carlisle, Pa., 19 Nov. 1823. He was graduated at Columbia in 1841 and served as lieutenant on the staff of Gen. Pillow in the Mexican war 1847-8, and during the Civil War commanded the 4th Michigan Infantry. He was breveted major-general in 1863; elected State senator for Michigan in 1878, and appointed chief engineer for railways in Michigan, New York, Illinois, Texas, and United States engineer of improvements on Wabash and White rivers in 1892. His writings include 'School of the Brigade, and Evolutions of the Line'; 'Treatise on Logarithms.'

Duffy, Sir Charles Gavan, Australian statesman: b. Monaghan, Ireland, 12 April 1816; d. Nice, France, 9 Feb. 1903. He took to journalism, and in 1842 assisted in founding a Dublin newspaper called the 'Nation.' In 1843 he was convicted of sedition with O'Connell, but the House of Lords in the following year quashed the conviction. He played a prominent part in the founding and directing of the Irish Confederation, and in 1848 he was brought to trial along with other members of that body on a charge of treason-felony, but the prosecution could not obtain a conviction. In 1852 he was elected to Parliament as representative of New Ross, and succeeded in forming an independent Irish political party. Dissensions arose and in consequence he resigned his seat and went to Australia in 1856. For some time he practised as a barrister in Melbourne. In 1857 he became minister of public works in the first responsible Victorian government. In 1858, and again in 1862, he was minister of lands, and became premier of Victoria in 1871. In 1880 he returned to Europe. Several works from his pen have been published, including: 'The Ballad Poetry of Ireland' (1845, about 50 editions); 'Young Ireland: a Fragment of Irish History 1840-50' (1880); 'Four Years of Irish History 1845-9' (1883), a sequel to the preceding work.

Dufrenite, dü-frën-it, a native basic phosphate of iron. It occurs in small crystals of orthorhombic form; but usually it is in radiating-fibrous masses, sometimes with botryoidal or drusy surface. Its hardness is 3.5 to 4, and specific gravity about 3.3. It is nearly opaque, has a silky lustre and a blackish-green color. It is found in Westphalia, Bohemia, France, and in Cornwall, England. In the United States it occurs as a fibrous coating in the green sand formation at Allentown, N. J., also in fine radiating masses in Rockbridge County, Virginia. Named in honor of the French mineralogist, Dufrenoy.

Dufrenoy, Pierre Armand, pê-är är-män dü-frä-nwä, French geologist and mineralogist: b. Sevran, Seine-et-Oise, 5 Sept. 1792; d. Paris 20 March 1857. In 1841 he published a great geological map of France with three volumes of text, and this was followed by his 'Treatise on Mineralogy.' He introduced a new classification of minerals, based on crystallography.

Dufrenoyite, dü-frë-noi'zit, an orthorhombic, opaque, brittle mineral of metallic lustre and blackish lead-gray color, named for the French mineralogist Dufrenoy. Hardness, 3; specific gravity, about 5.56. Composition: Sulphur 22.10, arsenic 20.72, lead 57.18=100. Found in Switzerland.

Dufresne, Charles, shärl dü-frän. See DU CANGE.

Dufresny, Charles Rivière, shärl rë-vë-är dü-frä-në, French poet: b. Paris 1654; d. there 6 Oct. 1724. He was appointed manager of the royal gardens, on account of the strong love of flowers which he manifested, and in this capacity introduced into France the taste for gardens in the English style. Among his dramatic pieces may be mentioned: 'L'Esprit de Contradiction,' a one-act play in prose; 'Le Mariage fait et rompu,' in verse; and a second prose piece in three acts, called 'Le Double Veuvage.' He also wrote a romance in which he depicts the manners of the time after the fashion of Le Sage, 'Les Amusements sérieux et comiques.'

Duganne, dü-gän', Augustine Joseph Hickey, American poet and novelist: b. Boston 1823; d. New York 20 Oct. 1884. He wrote many novelettes and romances, and a great number of miscellaneous papers under various signatures. His principal poetical works are: 'The Iron Harp,' and 'Parnassus in Pillory.' Among his other writings are a 'Comprehensive Summary of General Philosophy' (1845); and 'Class Book of Governments and Civil Society' (New York 1859).

Dugdale, Sir William, English antiquary: b. Shustoke, Warwickshire, 12 Sept. 1605; d. there 10 Feb. 1686. He was, in 1640, made *rouge croix poursuivant*, and had apartments in the heralds' office, with ample opportunities for his favorite study. With Dodsworth he prepared the 'Monasticon Anglicanum' (1655-73). The principal work of which Dugdale had the sole merit is the 'Antiquities of Warwickshire' (1656). At the Restoration he was appointed Norroy king-at-arms, and in 1677 Garter king-at-arms, with the honor of knighthood. Besides the works already mentioned, he published the 'Baronage or Peerage of England' (1675-6); 'Origines Judiciales, or Historical Memoirs of the English Law Courts of Justice, etc.' (1666); a 'History of St. Paul's Cathedral' (1658); and various minor writings.

Dugmore, Arthur Radclyffe, American artist and author: b. England 25 Dec. 1870. He studied painting at the Belle Arti, Naples; came to the United States in 1889, and has devoted himself to the study of ornithology, drawing, painting, and illustrating by photography. He has published: 'Bird Homes'; 'Habits of the Land Birds Breeding in the Eastern United States' (1900); 'Nature and the Camera' (1902).

Dugong, dü-göng, or **Duyong**, the Malayan name for the genus *Halicornes* of the order *Sirenia* or "sea cows." It is from five to seven feet long, occasional specimens attaining a length of nine feet. It is a marine animal, never ascending rivers, and feeds chiefly on seaweed; in which particular it differs from the related genus *Manatus*. It is found along the shores of Australia, of the Indian Ocean, and around the Red Sea. Unlike the manatee it has a crescent-shaped tail, its nostrils are on the upper part of the muzzle,

and its flippers are quite without trace of nails. The skull of the dugong is characterized by the thickness of the beak and the lower jaw, both of which are bent sharply downward, almost at right angles to the axis of the skull. In the males, the incisors are developed into large, straight tusks, pointing directly downward. In color the animal is grayish-blue sometimes whitish below. The female is proverbial among the Malays for her maternal solicitude for her offspring, of which but one is produced at a birth.

The flesh of the dugong is said to be extremely palatable; but its chief value, from a commercial standpoint, is the fine oil yielded by the Australian species (*Halicore australis*). This has been in such demand for medicinal and other purposes, as to have caused a wholesale slaughter amounting almost to the extermination of the species. See SIRENTA for structure.

Dug'out, a cave dug in the side of a hill or mountain, used as a dwelling, partly built of logs as seen in some sections of Montana, or as a place of refuge from cyclones and tornadoes. These are frequently to be seen in some of the western States. Also the name of a canoe or boat made from a log of wood, hollowed and shaped for use.

Duguay-Trouin, René, rê-nâ dü-gâ-troo-ăn, French seaman: b. St. Malo 10 June 1673; d. Paris 27 Sept. 1736. His various successful privateering expeditions attracted the attention of the government before he was 21, and Louis XIV. sent him a sword. He captured great numbers of English and Dutch ships on the coast of Spain and Ireland; in 1696 he took a great part of the outward-bound Dutch fleet under Wassenaar; in 1697 he entered the royal marine as a captain. He signalized himself so much in the Spanish war that the king granted him letters of nobility, in which it was stated that he had captured more than 300 merchant ships and 20 ships of war. By the capture of Rio de Janeiro (1711) he brought the crown more than 25,000,000 francs. Under Louis XV. he rendered important services in the Levant and the Mediterranean.

Du Guesclin, Bertrand, bër-trăn dü gâ-klăn, constable of France: b. Motte-Broon castle, near Rennes, 1320; d. 13 July 1380. Mainly to him must be attributed the expulsion of the English from Normandy, Guienne, and Poitou. He was captured by Chandos at the battle of Auray in 1364, and ransomed for 100,000 francs. While serving in Spain against Peter the Cruel he was made prisoner by the English Black Prince, but was soon liberated. For his services in Spain he was made constable of Castile, count of Trastamare, and Duke of Molinas; and in 1370 he was made constable of France. See LUCE, 'Histoire de Bertrand du Guesclin et de son époque' (1876); Stoddard, 'Bertrand Du Guesclin' (1897).

Duhamel, William, American physician: b. Maryland 1827; d. Washington, D. C., 15 Aug. 1883. He was graduated at the Maryland University of Medicine 1849; appointed adjunct professor of surgery in the Georgetown Medical College 1852; attended all the occupants of the White House during three presidential terms and was chief physician to the United States prisons in the District of Columbia 10 years.

Dühring, Eugen Karl, oi-gân kârl dü-rîng, German philosophical writer: b. Berlin 12 Jan. 1833. He studied at the University of Berlin, and practised law for a time; he then became professor of philosophy and political economy at Berlin in 1864, but gave up the position on account of quarrels with the faculty. He has written: 'Der Wert des Lebens' (1865), which did much to introduce the positivism of Comte into Germany; 'Kritische Geschichte der Philosophie' (1869); 'Logik und Wissenschaftstheorie' (1878); 'Die Judenfrage als Rassen-, Sitten-, und Kulturfrage' (1892); also a number of works in political economy, including 'Kapital und Arbeit' (1865); 'Die Verkleinerer Careys' (1867); and 'Kritische Geschichte der Nationalökonomie und des Sozialismus' (1879).

Duhring, Julia, American essayist: b. Philadelphia 23 Feb. 1836. She has been an extensive traveler in the United States, Europe, Asia, and Africa; and has published several volumes of critical essays on social life: 'Philosophers and Fools' (1874); 'Gentlefolks and Others'; 'Amor in Society'; 'Mental Life and Culture.'

Duiker-bok, dî-kér- or doi'ker-bök, a genus of small antelopes (*Cephalophus*), native to southern Africa. They are characterized by small, straight horns, generally present in both sexes; and by an upright tuft of hair between the horns. The typical species (*C. grimmii*) is found in bush-covered districts from the Cape of Good Hope to the Zambesi River, and ranges even farther north along the west coast of Africa. It stands about 26 inches high; its ears are long and narrow; its color is yellowish-brown, with a tendency to gray; but the color is decidedly variable. The horns, in this species present only in the male, are from three to five inches long, and rise at a sharp angle to the face. Of the allied species the following are the most important ones: The redbuck of Natal (*C. natalensis*), which differs from *C. grimmii* in that its horns incline backward, and are present in both sexes; and that its color inclines more to the reddish tint. The bluebuck of the jungle (*C. monticola*) is a tiny creature, only 13 inches high at the shoulder, that swarms in the Natal region. It is smaller and lighter in build than a hare; is bluish mouse-color, and has tiny straight horns. It feeds on berries and young shrubs. The zebra-antelope of West Africa (*C. doriae*) is distinguished by its coat of rich golden-brown, banded with eight or nine transverse lines across the back and loins. The wood antelopes, also West African, are nearly three feet tall, and are classed in two species, *C. sylvestris* and *C. jentinki*.

The name "duiker" signifies "ducker" or "diver," in allusion to the animal's rapidity of motion when in the thickets. Consult: Schweinfurth, 'Heart of Africa' (Leipzig 1878); and other books by African explorers and naturalists.

Duilius, Gaius, Roman general: b. about 300 B.C. He was trained to arms by his father Marcus, and rose to the highest rank as a naval and military officer. He became consul in 260 B.C., defeating the Carthaginians near Mylæ in that year. In honor of this victory, Rome's first success on the sea, a magnificent column (columna rostrata) was erected.

Duisburg, doo'is-boorg, Germany, city, an inland port of Prussia, in the Rhine province, about 13 miles north of Düsseldorf. The town has civic, educational, and other institutions in keeping with its importance. The finest of the churches is the 14th century Saint Salvator, with fine wall-paintings. Duisburg has blast-furnaces, foundries, and other works depending on the iron trade. Its chemical works, cotton-mills, and commerce are extensive. It is an ancient place, early rose to be a free town, and became a member of the Hanseatic league. It possessed a university from 1655 to 1818. The tomb of Mercator, the famous geographer, is here. Pop. (1900) 93,605.

Dujardin, Félix, fā-lēks dü-zhār-dāñ, French naturalist: b. Tours 5 April 1801; d. Rennes 8 April 1860. From 1827 to 1834 he delivered public lectures in Tours upon geometry and chemistry as applied to the arts. During the same period he published several geological works, in one of which he first made known the curious fact that artesian wells bring to the surface seeds and remains of insects, which have been taken from long distances and transported through subterranean passages. In 1833 and 1834 he published descriptions of the flora of the region of the Loire, and of the geology and fossils of Touraine. He then devoted himself to zoological researches, and published observations upon the *rhizopode*, for which he proposed a new classification. In 1839 he added extended annotations to the 3d volume of De Lamarck's 'History of Invertebrate Animals,' and among his later publications were his researches upon the brain of insects, and upon the instinct of bees. He was a professor at Rennes from 1839.

Dujardin, Karel, Dutch artist: b. Amsterdam 1640; d. Venice 20 Nov. 1678. He went to Italy when young, and was a member of the Society of Painters at Rome, among whom he was called BARBA DI BECCO. His works met with general approbation. His landscapes have spirit and harmony, his figures expression, and his color the brilliancy which distinguishes his school. His paintings are rare, and command a high price. He also published 52 landscapes etched with much spirit and ease.

Duk-Duk, in New Pommern (formerly New Britain,—the largest island of the Bismarck archipelago in the Pacific Ocean,—is a secret male society for the preservation of ancient observances among the Melanesian natives. The inculcation of respect and order among the youthful members of the community, the subjection of women, and the enforcement of obedience to the chiefs are among its main objects; its mystic ceremonies, masked dances, etc., are picturesque. The society is analogous to the West African negrital Mumbo Jumbo organizations, and is interesting sociologically as an uncivilized form of the *Vehmgericht*, lodges, bachelors' clubs, etc., of Europe and America. Consult: Powell, 'Three Years Among the Cannibals of New Britain' (1897).

Duke (in French *duc*, in Spanish *duque*, in Italian *duca*, in Venetian *doge*, all derived from the Latin *dux*, leader, commander), a title belonging originally to a military leader. The title seems to have come into use when Constantine separated the military and civil commands of the provinces; the title *dux* was then applied

to the military governor of a province, and the ducal rank was made inferior to that of the *comes* (count). The Goths, Franks, and other northern tribes who invaded the vast Roman territories, adopted, if they had not before borrowed, the titles of duke and count. Among those warlike peoples, however, the dukes, as military chiefs, soon acquired a marked pre-eminence over the counts, whose functions in the eastern and western empires were more of a civil and judicial nature. Under Charlemagne, who was jealous of the increasing power of the higher nobility, the dignity was suffered to cease, but under his weaker successors the ducal governors of the provinces attained an almost absolute independence. The concession of hereditary power and independent jurisdiction, first to the central province known as the Isle de France, and then to Aquitaine, extended itself under the Carlovingians to Burgundy, Normandy, and Gascony, and on the accession of Hugh Capet to all the other subaltern tenures. It was not long until the dukes, feeling secure in the unlimited governing power of their provinces, proclaimed their title to be as good as that of the king. They coined money, assumed the crown and sceptre, gave law to their subjects, made war even against the king, and reduced the royal jurisdiction to a few towns such as Rheims and Laon. From the time of Philip II. (Philippe Auguste) to that of Louis XI., however, these duchies were gradually reunited to the crown, and those subsequently accorded to the members of the royal family enjoyed none of the privileges of independent sovereignty. Prior to the Revolution dukes were created by letters patent of the king, and were of three kinds, and those designated as dukes and peers held the first rank and had a seat in parliament. The dignity of the second class descended to their male children, but that of the dukes by brevet ceased with themselves. The rank of Duke in the royal family of France was superior to that of prince, and sometimes inferior to that of count. The ducal, along with all other titles of nobility, was abolished at the Revolution, but was restored by Napoleon in 1806. In Germany the dukedom passed through phases similar to that exhibited in France. In 847 the Emperor Louis appointed a duke (Herzog) of Thuringia to protect the frontiers against the Wendes, or Vandals, a Slavonic tribe. The power of the dukes gradually increased, their dignity became hereditary, and they soon became powerful members of the German empire. An archbishop of Cologne, Bruno, was the first who bore (in 959) the title of archduke (Erzherzog), which since the time of the Emperor Frederick III. (1453) has been given exclusively to the princes of the house of Austria. All the Austrian princes are archdukes, as a distinguishing title of the imperial family. In Great Britain the title of Duke ranks as a title of honor or nobility next below that of a prince or princess of the royal blood and that of archbishop of the Church of England. The first hereditary Duke in England was the Black Prince, created by his father, Edward III., in 1336. The duchy of Cornwall was bestowed upon him, and was thenceforward attached to the eldest son of the king, who is considered a Duke by birth. The duchy of Lancaster was soon after conferred on his third son, John of Gaunt, and hence arose the special privileges which these two duchies still in part retain. In the reign of Elizabeth, in 1572, the

DUKE OF CONNAUGHT — DULCIMER

ducal order was extinct, and not revived till the creation of Villiers, Duke of Buckingham, and Ludovic Stuart, Duke of Richmond, by James I. There are over 30 dukes on the British peerage rolls, including those of the blood-royal. The coronet of a British Duke consists of eight strawberry leaves of a conventional type on a rim of gold. In the Bible the word *dukes* is used, Gen. xxxvi. 15, for the *duces*, of the Vulgate.

Duke of Connaught, kōn'nōt, ARTHUR WILLIAM PATRICK ALBERT, Prince of the United Kingdom, Duke of Saxony, Prince of Coburg and Gotha. He was born at Buckingham Palace, 1 May 1850, being the third son of Queen Victoria. He entered the Military Academy at Woolwich 1866; was rapidly promoted, and received his commission as general of brigade in 1880. He had been created Duke of Connaught and Strathearn and earl of Sussex 26 May 1874, and taken his seat in the House of Lords 8 June of the same year. He married Princess Louise Margaret of Prussia, the grand-niece of the Emperor William of Germany, 13 March 1879.

Duke of Exeter's Daughter, a rack in the Tower of London, so called after its inventor, a minister of Henry VI. According to Blackstone it was never put in use.

Duke's Children, The, the last of the political novels by Anthony Trollope, published in 1880.

Duke's Laws, so named from the Duke of York, afterward James II., was a code promulgated by Col. Richard Nicolls, the English commander who took New Amsterdam from the Dutch in 1664, and became governor of the colonies under the Duke's patent. They applied first to the Dutch: confirmed the patroons in their estates, which thenceforth were to be called manors; introduced jury trial; amended the criminal code, and provided for freedom of religion and equal taxation, and militia service. There was no popular election of magistrates at first; but the code was afterward modified into the instrument of government of New York and New Jersey.

Dukhobors, doo-kō'bōr, **Dukhobort'sy**. See DOUKHOBORS.

Duk'infeld, England, a borough in county of Chester, a few miles from Manchester. Extensive collieries, cotton factories, engineering, brick and tile works give employment to the greater part of the population. Pop. (1901) 18,929.

Dulag, doo'lāg, Philippines, a town on the eastern coast of the island of Leyte, at the mouth of the Catbassag River. There are large deposits of sulphur in the vicinity. Pop. 10,113.

Dulangan, doo-lān'gān, or **Gulangan**, a heathen tribe of the Philippines, living in the southern part of the province of Davao, island of Mindanao. It is uncertain whether they are of pure Malayan race, or have an infusion of Negro blood.

Dula'ny, Daniel, American colonial lawyer: b. Annapolis, Md., 1721; d. 1797. He was educated in England, at Eton, Cambridge, and the Temple, and was admitted to the bar of Maryland in 1747. He was deputy commissary general from 1754 to 1761, and a member of

the provincial council from 1757 to 1775. In 1765 he wrote a powerful pamphlet against the Stamp Act, and his arguments against arbitrary taxation furnished material for Chatham's famous speech on behalf of the American colonies in 1766. He was, however, a staunch Royalist, refused to take part in the Revolution, and lost nearly all his landed property by confiscation.

Dulcama'ra, a species of the genus *Solanum* of the potato family (*Solanaceæ*), known also as night-shade, blue bindweed, felonwort, poison flower, and bitter-sweet. See BITTER-SWEET.

Dulcama'rin, a glucoside which is separated from the aqueous extract of *Solanum Dulcamara*—bitter-sweet, and consists of a yellow, transparent, resinous, easily powdered mass, readily soluble in alcohol, sparingly in ether, and very slightly in water. It has a slight alkaline reaction, and yields a platinum salt. The narcotic alkaloid solanine is also obtained from bitter-sweet.

Dulce, dool'sā. (1) A lake of Guatemala, on the east coast, communicating with the Gulf of Honduras by the lakelet el Golfete. It is about 30 miles long by 12 broad. (2) A river in Argentina, has its rise in the province of Tucuman, and is called in its lower course the Saladillo River. The waters are salt for some distance from the mouth; and the stream really seems to lose itself in the salt marshes of Lake Porongos. (3) A gulf on the coast of Costa Rica, in Central America.

Dul'ce Do'mum, a famous song sung at Winchester College, England, on the eve of the break-up day for the summer holidays. The origin of both words and music is very uncertain—it is usual to ascribe the former to one Turner, probably him who became bishop of Ely, and was one of the seven bishops under James II.; the latter, to Johannes Reading, organist of the college from 1681 to 1689.

Dulcigno, dool-chēn'yō, Montenegro, a small seaport town on the Adriatic. The inhabitants, formerly notorious under the name of *Dulcignottes*, as the most dangerous pirates of the Adriatic, are now engaged in commerce or in the fisheries of the river Bojana. Pop. 5,102.

Dul'cimer, an ancient musical instrument used by various nations, and, in shape and construction, having probably undergone fewer changes than any other instrument. In its earliest and simplest form, it consisted of a flat piece of wood, on which were fastened two converging strips of wood, across which strings were stretched tuned to the natural scale. The only improvements since made on this type are the addition of a series of pegs, or pins, to regulate the tension of the strings, and the use of two flat pieces of wood formed into a resonance-box, for the body. The German name, *Hackbrett* (chopping-board), points to the manner in which it was played, the wires being struck by two hammers, one held in each hand of the performer. The fact which makes the dulcimer of the greatest interest to musicians is that it is the undoubted forefather of our pianoforte. A modern grand pianoforte is, in reality, nothing more than a huge dulcimer, the wires of which are set in vibration, not by

DULCINEA DEL TOBOSO — DULUTH

hammers held in the pianist's hands, but by keys; it is, in fact, a keyed dulcimer. It is by some supposed to be identical with the psaltery or *nebel* of the Hebrews.

Dulcinea Del Toboso, *dül-sin'ē-ä dël tō bö'sō*, Sp. *dool-thē-nā'ä däl tō-bō'sō*, the fanciful name given by Don Quixote to his lady love, because it was more romantic than her real name, Aldonza. The name is a popular one for the heroine of love romances.

Dul'cinist, one of a sect, followers of Dulcinus, or Dolcino, a layman of Lombardy in the 14th century. See APOSTOLIC BRETHREN.

Dulcite ($C_6H_8O_6$), a saccharine substance obtained by Laurent in 1850 from an unknown sugary plant from Madagascar, which was in rounded lumps, but crystalline when broken through. By dissolving in water, filtering from impurities, and evaporating, the dulcite was deposited in large transparent, lustrous, modified monoclinic prisms. Dulcite has a specific gravity of 1.46. It has a slightly sweet taste, no odor, and no rotatory effect on light. It is soluble in water, very sparingly soluble in alcohol. It fuses about 360° F.; at a higher temperature it loses water and yields *dulcitan*, and at still higher temperature is decomposed, giving off gases and a distillate with an acetous odor. It does not ferment with yeast. Dulcite combines with metallic oxides; the compounds with the alkalis and alkaline earths are crystalline and soluble in water.

Du Lhut, *dü-loot*, **Daniel Greysolon**, American pioneer: b. France about 1645; d. near Lake Superior 1709. He went to Canada about 1670, and became a trader and a leader of bushrangers. He chose the sites of Detroit and Fort William, fought in the Canadian war with the Senecas in 1687, and against the Iroquois in 1689, and was commander of Fort Frontenac in 1695. The city of Duluth is named after him.

Duluth, Minn., city and county-seat of St. Louis County, at the western end of Lake Superior, 1,463 miles from New York, 478 miles from Chicago, 400 miles from Milwaukee; and northeast 522 miles from Omaha, 2,370 miles from San Francisco; and southeast from Seattle 1,919 miles, and 498 miles from Winnipeg. Its area is 69 square miles and it extends along Lake Superior, Duluth harbor, and the St. Louis River from Lakeside to Fond du Lac, a distance of 24 miles. Duluth began at the base of Minnesota Point and has spread east and west along the water line, as well as northward upon the face of the great bluff, which, in the course of a mile from the water's edge, rises to a maximum height of 800 feet. Of its 200 miles of streets, 54.48 were in 1903 paved with various materials or macadamized, while a great deal of new paving work was being done.

Government.—The mayor, treasurer, comptroller, and two aldermen from each ward are elected by the people for two years; the clerk is appointed by the council. The chief of police, city engineer, city attorney, assessor, the city boards and minor officers are appointed by the mayor.

Municipal Improvements.—Street cleaning is a comparatively easy task, the greater part of the city enjoying the benefit of natural drain-

age. Street cleaning costs \$14,814.20 a year, and street sprinkling, \$7,779.74, is assessed to property. The sewage empties, through 40 miles of mains, into Lake Superior and Duluth harbor. Climate, clean streets, and pure water make Duluth one of the healthiest cities in the world, the death rate in 1900 being 13.2.

The city owns the water and gas systems. Water is drawn from a point 10 miles down the north shore of the lake, which is never approached by sewage. The city also owns the gas plant and during its ownership has reduced the price of gas from \$1.90 to 90 cents per 1,000. While thus reducing the price of water and gas, the city has spent a great deal of money on depreciated plants. The total cost of these plants to the city is: Water, \$2,081,072; gas, \$429,860. The police department costs \$49,491, and the fire department, \$101,933.23 per annum.

The electric street railway system consists of about 50 miles of track, representing an investment of \$2,500,000. The Duluth-Superior Traction Company controls the street railway system of both Duluth (Minn.) and Superior (Wis.). The line passes over the great interstate bridge and covers the time between the two cities in 35 minutes. In 1902 there were carried on the street railway system 8,000,000 passengers, and \$285,000 was expended in operating expenses.

Public Parks and Cemeteries.—The Duluth park system consists of five larger parks, two smaller ones, and five city squares. Fairmont Park at West Duluth contains 40 acres; Lincoln, at the West End, 50; Central, Central Duluth, 100 acres; Chester Park, East End, 100 acres; Lester Park, extreme East End, 25 acres; Cascade Park, 6th Street and First Avenue west, whose beauties are indicated by its name, covers 4 acres. Portland Square covers a block at West 4th Street and Tenth Avenue east. The main feature of this park system is Rogers boulevard, and the parks Fairmont, Lincoln, Central, Chester, and Lester. The boulevard is a drive of 7 miles along the bluffs at a height of 500 feet above Lake Superior, which is itself 600 feet above the level of the sea. From this drive is visible one of the finest views in the world. The chief beauties of Duluth's parks lie in the natural loveliness of forests, streams, rocks, and cascades. There are five cemeteries: Calvary Hill, Forest Hill, Oneota, Park Hill, Scandinavian Union, and Swedish Mission.

Chief Buildings.—Among the chief buildings the Central High School is probably the most extraordinary. It stands on a site more than 200 feet above the lake, site and building occupying a whole block. It has four stories, with commodious attic and basement, and a tower 229 feet high. Other prominent buildings are the Carnegie library, the State Normal School, the Spalding and St. Louis hotels, the Lyceum Theatre, the new buildings in the wholesale district, of which the Marshall-Wells is the largest wholesale hardware building under one roof in the world; the Wolvin building, and the huge elevators and flouring mills; the Board of Trade, and Federal buildings. The Duluth Public Library building was the donation of Andrew Carnegie. The fund was \$75,000. The building and grounds represent an outlay of \$93,000. The library now contains 40,000 volumes.

DULUTH

Among churches are the Cathedral, and 7 other Catholic churches, 6 Episcopal, 6 Baptist, 1 Christian Science, 2 Congregational, 1 Swedish Covenant, 3 Evangelical, 17 Lutheran, 11 Methodist Episcopal, 1 Unitarian, 1 Salvation Army Corps, and 2 Hebrew synagogues.

Educational and Intellectual Associations.—The city had in 1903 1 high school, 31 elementary and kindergarten schools, with 32 school buildings, an average daily attendance of 8,791 pupils and 258 teachers; 3 Roman Catholic parochial schools, and an Institute of the Sacred Heart. The new State Normal School had 100 pupils at the opening in 1903. The hospitals have a training school for nurses. The value of public property used for school purposes was in 1903 \$1,869,700 and the total expenditure for public schools for the school year 1903-4 was \$309,773.76. In 1903 Duluth had 2 daily papers, 6 weeklies, and a bi-weekly.

Manufactures.—The manufactures of Duluth, according to the census of 1900, were: Establishments, 433; capital, \$8,872,940; employees, 3,998; wages paid, \$2,145,444; cost of materials, \$5,861,499; total value of product, \$10,628,957; lumber and timber product, \$3,800,500; planing mill product, \$172,943; foundry and machine, \$475,848. In 1903 the Great Northern Power Company had acquired practically all the water power available at the head of Lake Superior. This water comes down through a vast drainage through the rapids of the St. Louis River to a point within the city of Duluth. These rapids aggregate a fall of nearly 600 feet. The company divided this power into two systems; the St. Louis Development, under a head of 365 feet, and the Duluth Heights System, under a head of 740 feet. For the first installation on the St. Louis rapids, the company had in 1903 a full-developed plan to build a steel dam 36 feet high and 628 feet across the river at the head of the rapids, thus creating a reservoir or forebay, about one mile square in extent, whence a canal 62 feet in width at the surface and 14 feet deep was to carry the water $2\frac{1}{2}$ miles to the brow of a hill, and thence by a series of wood stave and steel pipes to the main power house at the foot of the rapids under an effective head of 365 feet. The company aims at an ultimate development of 100,000 electric horsepower. This power is to be transmitted not only to Duluth but to Superior, the iron ranges and to other towns a long distance away.

The Duluth Heights System has a capacity of 200,000 horsepower additional, which is to be developed later on under an effective head, estimated at 740 feet, from the bluff directly back of the city of Duluth. The possibilities of the St. Louis water power have been appreciated for many years and engineers have been working on the problem of harnessing it to do man's work for a quarter of a century. The cities of Duluth and Superior voted liberal franchises to the company in 1902 and 1903, and in the latter year were looking forward confidently to developments which would revolutionize manufacturing at the head of Lake Superior. The Zenith Furnace Company, capitalized at \$950,000 in 1903, equipped a modern blast furnace at West Duluth with a daily capacity of 250 tons of pig iron. The company in the same year established a coking by-product plant. The company at the same date entered

into a contract with the city of Duluth to supply the latter with gas.

Trade and Commerce.—As the western terminus of the marine traffic of the Great Lakes, Duluth holds an important place in world-commerce. For 1902 the aggregate of vessel arrivals and departures at this port was 9,659. The arrivals numbered 4,816 and the departures 4,843. The registered net tonnage of arrivals and departures aggregated 13,927,284 net tons. In 1902 the total receipts of freight at the port of Duluth were 1,291,357 net tons, of a valuation of \$31,431,750, and the shipments were 7,884,236 net tons of a valuation of \$65,080,803. The total of freight received and shipped was 9,175,593 tons and the valuation of the same was \$96,512,553. The shipments of iron ore from Duluth for 1902 were 5,598,408 gross tons, as compared with 3,437,955 gross tons in 1901. Two Harbors, which holds the world's season record for the amount of iron ore forwarded from a single shipping point, is a sub-port of Duluth. Its record in 1902 was 5,605,185 gross tons as against 5,018,197 gross tons in 1901.

Duluth leads all other ports on the Great Lakes in point of vessel tonnage enrolled. It is the port of hail for 331 vessels, having an aggregate gross tonnage of 493,620, as shown by figures in the port collector's office, June 1903. Eleven lines ply regularly in the steamboat merchandise trade of Duluth, carrying both passengers and freight. Of the great number of coarse, bulk cargo lines, the Pittsburg Steamship Company, with 112 boats, controlled by the United States Steel Company, is the first.

The grain elevator storage capacity of Duluth is 17,000,000 bushels. There are two systems, the Consolidated Elevator Company, owning eight houses and having a total capacity of 12,000,000 bushels, and the Peavey system, with a total capacity of 5,000,000 bushels. The latter has the largest concrete elevator in the world and the only one of the kind in the United States. Its capacity is 4,000,000 bushels, and that of the working-house 1,000,000 bushels. For the crop year ending 31 July 1903 the total receipts of grain at Duluth were 26,296,921 bushels, of which the Consolidated received 17,900,000 and the Peavey 8,396,921 bushels.

The lumber shipments from this port for 1902 amounted to 279,787,788 feet. There are five coal docks, with an average storage capacity of about 1,000,000 tons. The receipts for 1902 were 818,532 tons of bituminous and 87,383 of anthracite.

The striking natural feature of the Duluth-Superior harbor is the great breakwater formed during countless ages by the contending waters of Lake Superior and of the St. Louis and Nemadji rivers descending from the heights. The seven miles of this breakwater to the northward is called Minnesota Point. The two miles at the south, from the natural entry to the Wisconsin mainland, is called Wisconsin Point. The Duluth Canal cuts this point about half a mile from the main land, and was originally the work of the people of Duluth, although the United States government subsequently took charge of it; and some years ago undertook the widening of it. It is 300 feet wide and 1,700 feet long and 25 feet deep, running between cement piers 10 feet high, which were completed in 1901 at a cost of \$550,000.

DUMANJUG—DUMAS

Duluth has eight railroads: Great Northern, Northern Pacific, Chicago, Milwaukee & St. Paul; Wisconsin Central; Chicago, St. Paul, Minneapolis & Omaha; Duluth & Iron Range; Duluth, Missabe & Northern, and the Duluth, South Shore & Atlantic.

Headquarters of six of the large constituent companies of the United States Steel Corporation are located in Duluth. They are engaged in the mining of ore on the Missabe and Vermilion ranges north of this city; in the carrying of it over railroads to the shore of Lake Superior, and in the transportation of it from docks here and in Two Harbors to the corporation's smelters and rolling mills in eastern States. The iron output of the ranges is practically controlled by the United States Steel through these constituent companies. The six are: The Minnesota Iron Company, Chandler Iron Company, and Oliver Mining Company, including over a score of mining firms in the combination of the trio; the Duluth, Missabe & Northern Railroad Company, the Duluth & Iron Range Railroad Company, and the Pittsburgh Steamship Company.

The most extraordinary feature of Duluth's commerce during recent years is the growth of her wholesale trade, particularly in the line of hardware and groceries, which has spread to the Pacific coast and even to Alaska.

History.—Groselliers, a French fur trader, and his associates were the first white men who visited what is now Duluth. In 1660 they shipped from the head of Lake Superior 60 canoes laden with furs. Daniel Greysolon Du Luth, after whom Duluth was named, was a French officer, who urged by an adventurous spirit led a strong party to the westward, following the line of the Great Lakes. He traded with the Indians at Fond du Lac in 1679, and it has been believed that he at one time maintained a camp on Minnesota Point. It was not until 1854 that the Indian title to the territory on which this city is built was extinguished by treaty. An election for the Territory of Minnesota, the object of it being to choose a delegate to Congress, was held on the unorganized, unplatted town-site of Duluth in October 1855. In May 1857, Duluth was incorporated as a town by an act of the territorial legislature. In 1867 a railroad from Duluth to St. Paul was begun and in 1870 the St. Paul & Duluth, the first railroad, was completed. In the same year Duluth was organized as a city; but the Jay Cooke failure of 1872 was a blow to the new mart of commerce and she relapsed into a village, retaining that status until 1890. Real work for the development of the iron ranges began in 1878, and in 1882 the first iron range railroad was completed between Two Harbors and Vermilion Lake. The hand of panic fell hard on Duluth in 1893 and depression lasted until 1899, since which time the city has enjoyed an exceptional share of prosperity.

Population.—The population of Duluth was 3,470 in 1880; 33,187 in 1890; and 52,969 in 1900. At the last date the foreign-born population was 39.6 of the total, the leading nationalities being as follows: Canadian English, 5,099; Swedish, 5,047; Norwegian, 2,655; German, 1,685; Canadian French, 1,285; Polish, 920; English, 817; Irish, 792; Finnish, 702; Italian,

292

Dumanjug, doo-män-hoog', Philippines, a town of the province of Cebu, situated on the west coast at the mouth of the Dumanjug River, 37 miles southwest of Cebu. It is open to the coast trade, and is a military station. Pop. 13,171.

Dumas, dü-mä, Alexandre, the Elder, French dramatist and novelist: b. Villers-Cotterets 24 July 1803; d. Puits, near Dieppe, 5 Dec. 1870. He was the son of a Republican general who bore the same name, and grandson of Marquis de la Paillette and a negress, Tiennette Dumas. He went to Paris at the age of 20, to push his fortune, and was employed by the Duke of Orleans as secretary at 1,200 francs a year. He now devoted his leisure hours to completing his education, and his ambition prompted him to shine in the field of literature. Some of his lighter dramatic works were rejected by the theatrical directors, some were accepted, and had more or less success, bringing but little fame or profit to their author. At last, in 1829, his drama of 'Henri III.' appeared on the stage of the Comédie Française. It was produced when the battle between the Romanticists and the Classicists was at its height, and hailed as a triumph by the former school. The piece became popular and brought the lucky dramatist the sum of 30,000 francs, and the post of librarian to the Duke of Orleans. The same year appeared his 'Christine,' and in quick succession, 'Anthony'; 'Richard d'Arlington'; 'Térésa'; 'Le Tour de Nesle'; 'Catharine Howard'; 'Mlle. de Belle-Isle,' etc. Dumas had now become a noted Parisian character. The critics fought over the merits of his pieces, and the scandalmongers over his prodigality and *galantries*. Turning his attention to romance, and desirous of becoming the Walter Scott of his country, he produced a series of historical romances, among which are: 'Les Deux Dianas'; 'La Reine Margot'; 'Les trois Mousquetaires,' which, with its continuations, occupies eight volumes. The 'Comte de Monte-Cristo,' and the 'Memories d'un Médecin,' are also well known through translations to English and American readers. Several historical works also bear his name: 'Louis XIV. et son Siècle'; 'Le Regent et Louis XV.'; 'Le Drame de '93'; 'Florence et les Médecins,' etc. In 1846 he accompanied the Duke of Montpensier to Spain as the historiographer of his marriage; and on his return to Paris he opened a theatre for the purpose of producing only his own pieces; and built a fantastic and costly country-seat, which was known as the Château de Monte-Cristo, and on which he expended 450,000 francs.

It is difficult to come to a satisfactory conclusion as to the merits of this author. Some of his productions are little else than mere translations from English and German sources. His first drama, 'Henri III.' is but a skilful piece of patchwork. Walter Scott and Schiller furnishing him with the bulk of the material. Equally fatal to his reputation is our knowledge of the fact, gained from a lawsuit he had with the *Presse* and the *Constitutionnel* newspapers, and from a work by Mirecourt, entitled, 'Fabrique de Romans, Maison A. Dumas et Cie.' (Dumas & Company's Romance Factory), that he had arranged to supply those journals during the year with more novels than the most expert scribe could copy in the time, and

that he had in his pay numerous hacks who did the serious part of the work. The only claim he could lay to a great number of the productions issued under his name, was that he either sketched the plot or revised them before going to press. Yet of the talent and even genius of Dumas there can be no reasonable doubt; he had great fertility of invention, much humor and gaiety, and genuine dramatic power, as the works that were undoubtedly from his pen sufficiently testify; and it was not till he had secured a front rank in literature by his own exertions that he descended to the unworthy plan of employing assistants to manufacture novels to order. Consult: Blaze de Bury, 'Alexandre Dumas, sa vie, son temps, son œuvre' (1885); Wells, 'Century of French Fiction' (1898); Parigot, 'Le drame d'Alexandre Dumas' (1898); and 'Alexandre Dumas père' (1902); Spurr, 'Life and Writings of Alexandre Dumas' (1902).

Dumas, Alexandre, the Younger, French dramatist and novelist: b. Paris 28 July 1824; d. there 27 Nov. 1895. He was the natural son of Dumas the Elder (q.v.), and while a young man shared his father's life in Paris, and accompanied him on his travels. In 1847 there appeared a collection of his poems under the title 'Péchés de Jeunesse'; his first novel 'Aventures de Quatre Femmes et d'un Perroquet,' was published in the same year; others of his novels are 'Césarine' (1848); 'La Dame aux Camélias' (1848); 'Le Docteur Servan' (1849); and 'L'affaire Clemenceau' (1866). 'La Dame aux Camélias' was dramatized in 1852, and marked the introduction of realism in the treating of social and moral problems on the stage. His other dramas include: 'Diane de Lys' (1853); 'Le Demi Monde' (1855); 'La Question d'Argent' (1857); 'Le Fils Naturel' (1858); 'Un Père Prodiges' (1859); 'L'Ami des Femmes' (1864); 'La Femme de Claude' (1873); 'La Princesse de Bagdad' (1881); 'Denise' (1885); and 'Francillon' (1887). He has also written a few essays, discussing social problems; these are: 'Lettre sur les Choses du Jour' (1871); 'L'Homme-Femme' (1872); 'Question du Divorce' (1880); 'Recherche de la Paternité' (1883). Dumas was made a member of the French Academy in 1874.

Dumas, Jean Baptiste André, zhǒn bāp-tēst ān-drā, French chemist: b. Alais, Gard, 14 July 1800; d. Cannes, France, 11 April 1884. He studied at Geneva, and going to Paris in 1821, was first a lecturer in the École Polytechnique, then professor of chemistry in the Athénée, the École Centrale des Arts et Manufactures (founded by himself), and finally, the Sorbonne. He now wholly devoted himself to chemical studies; and his views on chemical equivalents, and especially his memoir on the atomic theory, soon attracted attention over all Europe. His views on the laws of substitutions involved him in a long discussion with the great Berzelius. His researches in organic chemistry, especially his masterly papers on the ethers, ethereal oils, indigo, and the alkaloids, placed him in the first rank of chemists. In 1849-51 he was minister of agriculture and commerce, and also held offices under the Second Empire. In 1875 he was called to fill Guizot's chair in the Academy. His chief works are: 'Traité de Chimie appliquée aux Arts,' and 'Leçons sur

la Philosophie Chimique.' See Maindron, 'L'Œuvre de J. B. Dumas' (1886).

Dumas, Matthieu, French soldier and military writer: b. Montpellier, France, 23 Dec. 1753; d. Paris 16 Oct. 1837. He early entered the French cavalry, took part in the American Revolution, and was employed in the Levant and in Holland. At the commencement of the French Revolution he assisted Lafayette in organizing the National Guard. On the triumph of the extreme party in 1797 Dumas was proscribed, but made his escape to Holstein, where he wrote the first part of his 'Précis des Événements Militaires,' a valuable source for the history of the period of which it treats (1798-1807). After the Restoration, Louis XVIII. appointed him counselor of state and gave him several important appointments connected with the army. In 1830 he aided in bringing on the revolution of July, and after the fall of Charles X. obtained the chief command of all the national guards of France, together with a peerage.

Du Maurier, dü mō-rē-a, George Louis Palmella Busson, English artist, caricaturist, and novelist: b. Paris 6 March 1834; d. London 8 Oct. 1896. He belonged to an old French family which had been driven to England by the Revolution, and was a naturalized British subject. He spent some years in France and Belgium, and afterward went to school in London. He soon adopted art as a profession, working as a student in the galleries of the British Museum. Then, returning to Paris, he entered the studio of Gleyre, and next went to Antwerp to continue his artistic training. Returning to London, he began to draw on wood for 'Once a Week,' the 'Cornhill Magazine,' etc., and also exhibited at the Royal Academy. He subsequently joined the 'Punch' staff and became famous through his weekly drawings for that publication. He also illustrated a large number of books, including Thackeray's 'Esmond' and 'Ballads.' A collection of his 'Punch' woodcuts was published in 1880 under the title 'English Society at Home.' In 1891 appeared his first novel, 'Peter Ibbetson,' and in 1894 'Trilby,' a story which had a great popularity both in book form and on the stage. An incomplete novel by him was published posthumously as 'The Martian.' His novels can hardly be looked upon as very serious contributions to literature, but his 'Punch' drawings will no doubt have a permanent value as portraying many of the peculiarities of contemporary society.

Dumb Ague, an irregular intermittent fever, so named from the absence of shivering chills. See MALARIA.

Dumb-bell. See GYMNASICS.

Dumb-cane, a popular name for a West Indian plant (*Dieffenbachia sequina*) of the arum family. The acidity which is characteristic of most of the members of the arum family in this species causes a swelling of the tongue with excruciating pain, if the plant is chewed, and for a time destroys the power of speech, whence its name. Many species and varieties of *Dieffenbachia* are in cultivation as foliage plants.

Dumbar'ton (ancient LENNOX or LEVENIX), (1) A maritime county of Scotland. Pop. (1901) 113,870. (2) A seaport, and the chief town in the

DUMBNESS — DUMONT

county, on the Leven; 13 miles northwest of Glasgow. Ship-building is the chief business, the six principal yards employing about 4,000 men. The rock and castle of Dumbarton, a short distance from the town, is noted in history. The fortress was erected over a thousand years ago. It is one of the four fortresses stipulated to be kept in repair by the articles of the Union. Pop. (1901) 19,864.

Dumbness, inability to speak. In a very large number of cases it arises from no malformation of the organs of speech, but is a necessary sequence of congenital deafness. A child acquires language by listening to and imitating the speech of its relatives or other people who talk in its presence, and picks up not merely the language of its country, but the exact pronunciation of the locality in which it for the time is. Total deafness, therefore, naturally produces dumbness. Distinct from congenital dumbness is the loss of speech in the case of those who have become affected with aphasia, which results from some disease of the brain, and aphonia, which is due to disease of the larynx or vocal chords. See DEAF-MUTES.

Dum'dum, India, town, municipality, and cantonment in the province of Bengal, five miles east-northeast of Calcutta. The town is famous as being the scene of the first open manifestation of the Sepoys against the greased cartridges, which led to the outbreak of the mutiny of 1857. Pop. (1891, including the military), 21,000.

Dumdum Bullet, a bullet so named after Dumdum Arsenal, the place near Calcutta where it was first made. It is one which instead of having its greatest strength at the point is weakest there, so that in striking a bone it will flatten out and shatter it, and not, like the modern steel-coated, sharp-pointed bullet, make a small hole and pass through without any other effect. At Santiago the Spaniards were charged with cutting off the brass tips of their bullets so that they had the same effect in inflicting jagged wounds as the regular dumdum bullets. Dumdum bullets are now used to some extent by big game hunters. The Hague Peace Congress agreed that dumdum bullets should not be used in war. In the war against the Boers in South Africa (1899-1902) the British were charged with using a modification of this bullet. See BULLET.

Duméril, André Marie Constant, än-drä mä-rê kôn stän dü-mä-rêl, French physician and naturalist; b. Amiens 1 Jan. 1774; d. Paris 2 Aug. 1860. From 1801 to 1818 he was professor of anatomy and of physiology of the medical faculty of Paris. His works on natural history and analytical zoology are distinguished both for accuracy of details and for philosophical treatment. In his most celebrated production, '*L'erpétologie générale*' (1835-51), which contains the first attempt at a systematic description of all known reptiles, he had Bibron as collaborator.

Dumersan, dü-mär-sän, Théophile Marion, French playwright; b. Issoudun 4 Jan. 1780; d. Paris 13 April 1849. He was employed in the Paris mint. He wrote many plays, all marked by keen observation and comic spirit. His '*Angel and Devil*,' a five-act drama, had a "run" of over 100 presentations; still more successful

was his '*Mountebanks*,' his masterpiece and a classic in its kind. Other very successful plays written by him are: '*The Wigmaker, or Heads à la Titus*'; '*Ridiculous Englishwomen*.' Worthy of mention is his volume of '*National and Popular Songs of France*.'

Dumfries, düm-frêz', a maritime county, Scotland; area 1,098 square miles. The surface is irregular; about one half is good farming land, and valuable minerals are found in the hill sections.

Dumfries, a river port, railroad centre and parliamentary borough, capital of the county of same name, and the chief town in the south of Scotland; on the Nith, about six miles from its junction with the Solway Firth. It is connected with the suburb Maxwelltown (in Kirkcudbright) by three bridges, one dating from the 13th century. Pop. (1901) 72,569.

Dummer, Jeremiah, American scholar; b. Boston about 1680; d. in Plaistow, England, 19 May 1739. He was graduated at Harvard College in 1699, where he was noted for the vigor and brilliancy of his genius. With the purpose of preparing for the clerical profession, he went abroad, and studied in the university of Utrecht. On his return to America he abandoned his chosen vocation, and soon after went to England, where, as agent of Massachusetts, he rendered important services to his countrymen. He was an admirer of Lord Bolingbroke, in whose daring and reckless genius he found much that was congenial to his own character, and in intimacy with whom he adopted something of his moral and religious license. He published theological and philosophical disquisitions in Latin while at Utrecht, and his '*Defence of the New England Charters*,' written in England (1728), is admirable both in style and matter. The traditions and records concerning him alike testify to his remarkable powers, and his easy command of them in speaking, writing, and in intercourse with men.

Dummer's War, 1724-5, an episode in the long struggle of the French governors of Canada to check English settlement by inciting the Indians to raids and massacre of the border settlers. It was named after William Dummer, acting-governor of Massachusetts, who organized the resistance against the Indian expeditions sent by Vandreuil, governor of Canada, against the villages of Massachusetts and Maine, and of Vermont where Fort Dummer had been built on the site of Brattleboro in 1724. One of its chief incidents was the aggressive retaliation of Dummer and the victorious assault by the English on Norridgewock, Me., when Sebastian Rale, the Jesuit missionary and Indian leader, was killed with 26 Abenaki Indians, 12 Aug. 1724. The further crushing decimation in Lovewell's fight (q.v.) at Fryeburg, Me., 8 May 1725, led to four Indian chiefs signing a treaty for the Penobscots and other Abenakis at Boston in November 1725, which was ratified by the latter the following year.

Du Mond', Frank Vincent, American artist; b. Rochester, N. Y., 1865. He was a pupil of Boulanger, Lefebvre and Benjamin Constant, and received a third-class medal at the Paris salon in 1890.

Dumont, dü-môn, Albert, French archæologist; b. Scey-sur-Saône, 1842; d. 1884. He

was educated in Paris, and devoting himself to the study of prehistoric, Byzantine, and Christian archaeology, published 'De Plumbis apud Græcos Tesseris' (1870); 'Inscriptions céramiques de Grèce' (1871); and 'Vases peints de la Grèce propre' (1873). In 1874, in Rome, and the following year in Athens, he lectured on archaeology and the history of art. In 1878 he was elected rector of the academy of Grenoble, in 1879 rector of the academy of Montpellier, and until his early death was a superintendent of higher education. The most important of his later works is 'Les céramiques de la Grèce propre, vases peints et terres cuites' (1882-90), prepared in collaboration with Chaplain.

Dumont, dü-môn, Augustine Alexandre, French sculptor: b. Paris 14 Aug. 1801; d. there 25 Jan. 1884. He was a most prolific worker, and his statues are found on or in many of the public buildings and churches of his native city. His most noted productions are, the colossal statues of the 'Genius of Liberty' on the Column of July, made in 1840, and the statue of Napoleon III. on the Column Vendôme.

Dumont, Julia Louisa, American educator and writer: b. Waterford, Ohio, October 1794; d. Vevay, Ind., 2 Jan. 1857. She has the distinction of being one of the earliest women of the West whose writings have been preserved. She contributed largely to periodicals both in prose and verse. A collection of her writings was published in a volume, 'Life Sketches from Common Paths' (1856).

Dumont, Pierre Etienne Louis, pē ār ā-tē-ēn loo-ē dü-môn, Swiss scholar: b. Geneva 18 July 1759; d. Milan, Italy, 30 Sept. 1829. In 1785 he became tutor in London to the sons of Lord Shelburne. His superior talents soon recommended him to the illustrious Whigs of that period; with Romilly, in particular, he formed a close friendship. During the early years of the French Revolution, Dumont was at Paris, where he became greatly attached to Mirabeau, regarding whom he has given the world much valuable information in his posthumous 'Souvenirs sur Mirabeau' (1832). In this work he claims to have composed for him many of Mirabeau's most eloquent speeches. In 1791 Dumont returned to England, and formed an intimacy with Bentham (q.v.). This was the event of his life. Deeply convinced of the value of Bentham's views on legislation, he requested him to allow him to arrange and edit his unpublished writings on this subject. Bentham gave him his manuscripts, which Dumont labored earnestly to abridge, elucidate, correct, and simplify. The results appeared in his 'Traité de Législation Civile et Penale' (1802); 'Théorie des Peines et des Récompenses' (1811); 'Tactique des Assemblées Législatives' (1816); 'Preuves Judiciaires' (1823); and the 'Organisation Judiciaire et Codification' (1828). Dumont returned to Geneva in 1814, and became a member of the representative council.

Dumont D'Urville, Jules Sebastian César, zhül sâ-bās-tē-ōn sâ-zâr dü-môn dūr-vël, French navigator: b. Condé-sur-Noireau, Calvados, 23 May 1790; d. near Paris 8 May 1842. After completing his studies at Caen he entered the navy, in which he ultimately rose to be vice-admiral. He was twice wrecked and on both occasions owed his escape chiefly to self-possession and skilful seamanship. He rendered im-

portant service by his search for the remains of the ill-fated expedition of La Pérouse, the survey of long tracts of coast in New Zealand and New Guinea, the discovery of numerous islands and an antarctic continent, and the exploration of very dangerous and still imperfectly known tracts of navigation, as Torres' Straits, in Australia, and Cook's Straits, between the two large islands of New Zealand. To his contributions to geography he was indebted for his nomination to the office of president of the Paris Geographical Society. One fruit of his voyages was the 'Enumeratio Plantarum in Insulis Archipelagi et Littoribus Ponti Euxini' (1822). After his second circumnavigation, he published the 'Voyage de l'Astrolabe' (1830-9), and 'Voyage Pittoresque autour du Monde' (1834).

Dumortierite, a native basic silicate of aluminum, of somewhat uncertain composition. It crystallizes in fibrous or columnar forms belonging to the orthorhombic system, and has a hardness of 7 and a specific gravity of about 3.3. It is transparent or translucent, with a vitreous lustre and a blue or greenish blue color, and is strongly pleochroic. Dumortierite occurs near Lyons, France, and also in certain parts of Norway and Silesia. In the United States it is found in New York city, and in Yuma County, Arizona. The mineral is named for Eugene Dumortier, a French palæontologist.

Dumoulin, dü-moo-lăn, John Philip, Canadian Anglican bishop: b. Dublin, Ireland, 1836. He was educated at Trinity College in the city of his birth, and emigrating to Canada was ordained priest in 1863. After an extended experience as a parochial clergyman he was appointed rector and canon of St. James' Cathedral, Toronto, in 1882, and in 1896 was elected third bishop of Niagara.

Dumouriez, Charles François, shärl frän-swä dü-moo-rē-ä, French general: b. Cambrai, 25 Jan. 1739; d. near Henley-upon-Thames, 14 March 1823. He entered the army early in life and at 24 years of age had received 22 wounds, and was made a knight of St. Louis. In 1772, Louis XV. sent him with communications to Sweden, but he was arrested, and for a long time confined in the Bastille. In 1789 we find him a principal director of the Jacobin club, composed of all who aspired to be accounted the friends of liberty. He afterward became a minister of Louis XVI., when he strongly advised the monarch to yield the direction of the interior affairs of the kingdom to the council of the assembly then sitting, and to declare war against the foreign foes of France. The advice was disregarded and Dumouriez was dismissed. Still determined to devote himself to the service of the army, he proceeded to Valenciennes, where he soon gained fame by his valor and his firmness, displayed at the head of the French soldiers, having succeeded Lafayette in the command of the Army of the North. He rendered very important service to his country by the stand he so skilfully made against the Prussian invaders in the forest of Argonne, in September 1792, the famous "Cannonade of Valmy" taking place on the 20th of the same month. His rapid conquest of Belgium followed. Notwithstanding his success, the Directory, not without motive, entertained suspicions regarding his designs. Dumouriez had entered into secret negotiations with the enemy, and learning that an

DUN — DUNCAN

accusation of treason was to be brought against him, he fled to the Austrian headquarters. He refused, nevertheless, to serve against his country; wandering for some time through Europe, and lastly settled in England.

Dun, Edwin, American diplomatist: b. Chillicothe, Ohio, July 1848. He went to Japan in 1873, becoming successively United States second secretary of legation, first secretary of legation, and was from 1893 to 1897 United States minister. During the war between China and Japan the Chinese government placed its interests in Japan in his care.

Dun (Celtic *dun*, Irish *dūn*, Gael *dūn*, a hill, castle), a word used as a prefix or suffix in the names of cities as, in Augustodunum (Autun), and in many names in Scotland and Ireland, as in Dunblane, Dundee, Dundalk, Dunboyne, etc.

Dūna, or **Southern Dvina**, so named to distinguish it from the northern Dvina, a west Russian river, which flows from a small lake near the source of the Volga, in the southwest of the government of Tver, and after a circuitous route of about 650 miles with a generally north-western trend, empties into the Gulf of Riga, 10 miles below Riga. For some distance it forms the boundary between the governments of Vitebsk and Livonia on the north bank, and Vilna and Courland on the south bank. Although obstructed by rocks and rapids, it is navigable for ocean vessels to Riga, for vessels of lighter draft to Dünaburg, and for flat-bottomed barges almost from its source; it commands a large river traffic; on an average it is icebound 115 days in the year. Canals connect it with the Volga, the Beresina, the Niemen, and Lake Ilmen.

Dünaburg, dū'nā-boorg, or **Dvinsk**, Russia, a fortified town of Russia, government of Vitebsk, on the Dūna, 112 miles southeast from Riga. It was formerly the capital of Polish Livonia. It is of great military importance, and carries on a considerable trade. Pop. 72,231.

Dunant, Jean Henri, zhōn ōn-rē dū-nān, Swiss philanthropist: b. Geneva 1828. While traveling near the battlefield of Solferino in 1859, he took part in the relief of those wounded in that battle, and realized the inadequacy of the provisions for the work. As the result of his experiences there he wrote 'Un Souvenir de Solferino,' advocating more efficient care of the wounded on the field of battle. He also lectured on the subject before the Society of Public Utility in Geneva, and enlisted the sympathy of the president and other members. A meeting of the society was called to consider the formation of permanent organizations for the relief of the wounded, and from this grew the conference at Geneva in 1864, and the Red Cross Society (q.v.). Dunant devoted his fortune to the organization and work of this society, and was pensioned by the empress of Russia. He has written 'L'Empire Romain reconstitué' (1858); 'Fraternité et Charité Internationales en Temps de Guerre' (1864); 'L'Esclavage chez les Musulmans et aux Etats Unis de l'Amérique' (1863); and 'La Rénovation de l'Orient' (1865).

Dunbar, Paul Laurence, American author: b. Dayton, Ohio, 27 June 1872, d. 10 Feb. 1906. He was graduated from the Dayton high school in

1891, and from that time devoted himself to literature and journalism. After 1898 he was on the staff of the librarian of Congress. He published 'Oak and Ivy' (poems) (1893); 'Majors and Minors' (1895); 'Lyrics of Lowly Life' (1896); 'Folks from Dixie' (1898); 'The Uncalled,' a novel (1898); 'Lyrics of the Hearthside' (1899); poems of 'Cabin and Field' (1899); 'The Strength of Gideon' (1900); 'The Love of Landry' (1900); 'The Spirit of the Gods,' a novel (1901); 'The Fanatics,' a novel (1901).

Dunbar, William, Scottish poet: b. Salton, Lothian, about 1465; d. about 1525. He was a Franciscan friar, but was often employed by James IV. in affairs of state. Among his works are the panegyric poem 'The Thistle and the Rose,' written (1503) on the marriage of James with Margaret of England, and 'The Golden Targe' (1508), consisting of allegories in the fashion of the time and of Chaucer, among them a poem on 'The Dance of the Seven Deadly Sins Through Hell.' He is at his best in burlesque poetry, as witness the autobiographical 'Visitation of St. Francis.' He is as 'rich in fancy as Spenser; as homely and shrewd as Chaucer in the 'Miller's Tale'; as pious as Cowper in his hymns, and as wittily grotesque as Burns in 'Death and Dr. Hornbook.' "

Dunbar, Scotland, a royal and municipal borough and seaport in Haddingtonshire, at the mouth of the Firth of Forth. It is a place of great antiquity, having originated in a castle, once of great strength and importance, which underwent several memorable sieges; on one occasion being successfully defended against the English for 19 weeks by Black Agnes, countess of Dunbar. Queen Mary and Bothwell (1567) took shelter in this castle. In 1650 Cromwell, at the "Race of Dunbar," totally defeated the Scottish army under David Leslie. The harbor, opened in 1844, is not very commodious, but the town is an important fishing station. Pop. 3,545.

Duncan, Adam, Viscount, Scottish naval officer: b. Dundee 1 July 1731; d. Scotland 4 Aug. 1804. He went to sea when young and was a post-captain in 1761. In the following year he served at the taking of Havana; and in 1779 he shared in the victory of Admiral Rodney over the Spaniards. In 1795 he was appointed commander of the North Sea fleet, and in October 1797, won a brilliant victory over the Dutch fleet off Camperdown, for which he was rewarded with the title of Viscount Duncan and a pension of \$10,000 a year.

Duncan, Norman, American journalist: b. Brantford, Ontario, Canada, 2 July 1871. He was educated at the University of Toronto 1891-5, entered journalism and is at present (1903) on the editorial staff of the New York *Evening Post*. He has written short stories and sketches for the 'Atlantic Monthly,' 'McClure's Magazine' and others, and has published 'The Soul of the Street: Stories of the New York Syrian Quarter' (1900).

Duncan, Sarah Jeanette. See COTES, SARAH JEANETTE.

Duncan, Thomas, Scottish painter: b. Kinclaven, Perthshire, 24 May 1807; d. Edinburgh 25 May 1845. He began to exhibit at the Scottish Academy in 1828, and became an aca-

DUNCAN — DUNDAS ISLAND

demician in 1830. The first picture which extended his fame beyond the Tweed, and helped to procure his admission as an associate of the Royal Academy (1843), was 'Prince Charles Edward and the Highlanders entering Edinburgh after the Battle of Prestonpans' (1840). Another famous picture of his is 'Charles Edward asleep after Culloden, protected by Flora Macdonald.' His last exhibited work was the 'Martyrdom of John Brown of Priesthill,' now in the Corporation Gallery of Glasgow. He also executed many portraits.

Duncan, William Wallace, American clergyman: b. Boydtown, Va., 20 Dec. 1839. He was graduated at Wofford College (S. C.) in 1858, becoming a minister of the Methodist Episcopal Church, South, and serving as chaplain of a Confederate regiment during the Civil War. From 1875 to 1886 he was professor of intellectual and moral philosophy at Wofford College. Since 1886 he has been a bishop of the Methodist Episcopal Church, South.

Dun'cansby Head, a picturesque promontory, forming the northeastern extremity of Scotland, in the county of Caithness. It consists of a circular rocky eminence of about two miles in circumference, and is intersected by large ravines and remarkable fissures. About a mile and a half west stood the celebrated John O'Groats' house, of which no trace now remains.

Dunce, a word introduced by the Thomists or disciples of Thomas Aquinas, in ridicule of the Scotists, or disciples of John Duns Scotus, schoolman, who died 1305 A.D., to denote a subtle sophist given to caviling where he cannot refute. When the reaction against the schoolmen took place at the Reformation the merits of those acute metaphysicians were temporarily decried, and the celebrated John Duns Scotus coming in for a more than ordinary share of disparagement, he, though a man of very subtle intellect, was held by the more ignorant or prejudiced of the Reforming party to be a man of invincible stupidity. He was therefore made to stand as the prototype of all modern dunces. Succeeding generations have the unfavorable verdict thus passed on the cultivators of scholastic philosophy. The schoolmen were the intellectual leaders of the age in which they lived, and rendered good service to humanity.

Dunciad, dūn'si-ād, **The**, a celebrated satirical poem by Pope, in which he gibbets his critics and foes. The first three books were published in 1728; the fourth book, or 'New Dunciad,' appeared in 1742. Cibber was latterly substituted for Theobald as the hero.

Duncker, doon'kēr, Dora, German story-writer and humorist: b. 28 March 1855. The conceits 'Incurable' (1893); 'The Sphinx,' and other tales and comedies, have succeeded; while in 'Modern Masters' (1883) she has evolved excellent character studies.

Duncker, Maximilian Wolfgang, German historian: b. Berlin 15 Oct. 1811; d. Anspach 21 July 1886. Politics interested him in early years, but his later energies were given to elaborate historical investigations, of which the best fruits are: 'The Crisis of the Reformation' (1845); 'Feudalism and Aristocracy' (1858); and the masterpiece 'Ancient History' (1852-7).

Dun'combe, Thomas Slingsby, English politician: b. 1796; d. 13 Nov. 1861. He was

elected member of Parliament for Hertford in 1824, assisted in carrying the Reform Bill, and became prominent in the extreme Liberal party. In 1842 he presented the Chartist petition, signed by 3,000,000 of the lower classes, in favor of universal suffrage, vote by ballot, short Parliaments, etc. In 1842 he then home secretary having sanctioned the opening of the letters of Mazzini, Duncombe, in the House of Commons, denounced, with scathing invective, the adoption of the post-office spy system on English soil. He was an earnest advocate of Jewish emancipation; and his motion, 1858, for placing Baron Lionel Rothschild on a committee of the House of Commons was soon followed by the concession of the right of Jewish members to sit in the House of Commons.

Dundalk, dūn-dāk', Ireland, a maritime town, capital of the county of Louth, on Castletown River. It is an ancient place, and in the battle of Faughart (1318) fought in its vicinity, Edward Bruce, the brother of King Robert Bruce of Scotland, was slain. It manufactures ropes and castings, and the trade, chiefly in cattle and agricultural produce, is extensive. Pop. (1901) 13,067.

Dundas', Henry, VISCOUNT MELVILLE, Scottish statesman: b. Edinburgh 28 April 1742; d. 28 May 1811. He studied at the University of Edinburgh and in 1766 was appointed solicitor-general for Scotland. In 1782 he was appointed treasurer of the navy and made a member of the privy council; but he continued only a short time in office. In 1791 he was made home secretary, and in 1794 became secretary of war. In 1804 he was appointed first lord of the admiralty under Pitt. Next year he was impeached, before the House of Lords, "of high crimes and misdemeanors" in his former office of treasurer of the navy. As the evidence adduced against him did not directly implicate him in the malversation proved against his deputy, he was acquitted. He was long practically the manager of Scottish affairs, and also of those of India.

Dundas', Robert, LORD ARNISTON, Scotch judge, b. 9 Dec. 1685; d. 1753. He was admitted to the Edinburgh bar in 1709, and soon became known as a successful lawyer with forcible and ingenious methods of reasoning. In 1717 he received the appointment of solicitor-general, a crown appointment, which was followed by advancing positions until in 1737 he became a judge, and in 1747 rose to the dignity, which he retained until his death, of lord president of the court of sessions of Scotland. His eldest son, ROBERT, b. 18 July 1713, d. Edinburgh 13 Dec. 1787; was educated at Edinburgh University, studied law at Utrecht and Paris; in 1737 gained admittance to the Scottish bar, and, like his father, rose through successive crown positions to that of lord president of the court of sessions of Scotland, which he attained in 1760 and occupied until his death.

Dundas, Canada, a town in Wentworth County, in the province of Ontario; situated on a bay at the western extremity of Lake Ontario. It is a manufacturing and shipping centre. Pop. (1901) 3,173.

Dundas Island, an island on the coast of British Columbia, separated from the most southerly of the islands of Alaska by Chatham Sound.

DUNDAS ISLANDS — DUNGLISON

Dundas, or Juba, Islands, are a group of about 500 coral islets off the east coast of Africa in lat. 1° S. The group has one safe anchorage.

Dundas Strait, a passage about 20 miles wide, separating Melville Island from Coburg Peninsula in northern Australia.

Dundee, Viscount of. See GRAHAM, JOHN.

Dundee, Scotland, a flourishing borough and seaport in county Forfar, on the Tay, 8 miles from the sea, and 37½ miles north-east of Edinburgh. Dundee in former times was the scene of many battles. Gen. Monk (1651) burned the place and massacred 1,000 of its inhabitants. It has a fine harbor, and splendid docks, and manufactures osnaburgs and other coarse linens, canvas and bagging for export, and colored threads and gloves. Dundee possesses many shipyards, sugar refineries, tanneries, and machine shops. Its linen trade is the largest in Great Britain. Pop. (1901) 160,871.

Dundonald, Thomas Cochrane, 10TH EARL OF. See COCHRANE, THOMAS.

Dundrear'y, Lord, a prominent character in Tom Taylor's well-known comedy of 'Our American Cousin.' The part originally contained but 47 lines, but it was enlarged by the actor, E. A. Sothorn, who became famous in this role.

Dune, dūn, a low sand-hill; an accumulation of sand; a hill-fort, or a regular building commonly called a Danish fort. Sand dunes are made by the blowing of sand, this material having been produced by the grinding down of rocks under the influence of breakers on the seashore or coast, or any similar agency. Such sand dunes in many places skirt the shores of Holland, Great Britain, Spain, and other countries, in some places encroaching on and covering what once was cultivated land. Originally the "downs" of England were similar to the dunes. The dunes along the Atlantic coast of the United States have changed materially the form of the coast line; some of these dunes are high hills, and still higher hills are on the coast of some of the islands of the Bahamas.

Dune Plants, plants characteristic of dunes, those somewhat unstable sandy areas formed under the influence of wind. The species capable of withstanding these conditions are few in number and are marked by well developed underground parts, including extensive root and numerous root-hairs, and storage organs, especially rhizomes. They are capable also of being partially buried, without apparent injury. Since some dunes are migratory, or tend to extend over wider and wider areas, thus destroying the natural vegetation, crops, and even orchards and forests, these plants are of special interest. Some of them, especially marram or beach grass, also known as sand reed (*Ammophila arenaria*), are widely planted upon beaches and dunes, to hold the sand and prevent its being blown by the wind. The United States Department of Agriculture, through its division of agrostology, has done immense service to land-owners along the shores of both the Great Lakes and the ocean coasts, in the planting of soil-binding grasses, as the plants are called. In time the planted areas support other vegetation and the dune may be consid-

ered conquered. On the other hand, should the dune advance it may disclose in its wake the remains of the vegetation it had buried. In western Michigan sand dunes have buried many peach orchards. In general the vegetation characteristic of dunes consists of xerophytes (q.v.), but the xerophytic character is due to the shifting of the sand and not to the conditions of growth. See DISTRIBUTION OF PLANTS.

Dunedin, dūn-ē'din or dūn-ēd'in, New Zealand, town, capital of the province of Otago; on Otago harbor. It is about nine miles from its port, Port Chalmers, with which it is connected by railroad. Gold discovered nearby in 1861 has caused the recent rapid growth of the town. Wool and gold are the staple exports. Pop. (1901) 24,886; including suburbs, 52,390.

Dunfermline, Scotland, a town in Fife, 16 miles northwest of Edinburgh. It is a place of antiquity, from 1057 till 1650 a frequent residence of Scotland's kings, and for more than two centuries their place of sepulture. It was here that Charles II. signed the Covenant in 1650. Some of the prominent institutions now in the town are the Carnegie Library and the Carnegie Baths, the schools and the churches. Pop. (1901) 25,250.

Dung-beetle, a name borne by several lamellicorn beetles, of the genera *Aphodius*, *Bolbocerus*, *Copris*, *Geotrupes*, *Phaneus*, and others. These beetles nest and lay their eggs in the droppings of cattle, and are found throughout America, Europe, Asia, and Africa. An African species is the sacred scarabæus of Egypt (*Ateuchius sacer*).

Dungar'van, Ireland, a municipal borough and seaport in the county of Waterford. It is a resort for sea-bathing. Its ancient castle, situated in the centre of the town, is now used as a barrack. The harbor is shallow and there is little trade. Fishing is the chief occupation. Pop. (1901) 4,850.

Dungeness, dūnj'nēs, a headland on the south coast of Kent, 11 miles southeast of Rye. It has a fort and government lighthouse.

Dunglison, dūng'li-sōn, **Richard James**, American physician: b. Baltimore, Md., 13 Nov. 1834; d. Philadelphia 4 March 1901. He was a son of Robley Dunglison (q.v.). He was graduated at the University of Pennsylvania 1852, and from Jefferson Medical College 1856. During the Civil War he served as surgeon in the Philadelphia military hospitals. He soon gave up the practice of medicine in order to devote himself to literary work and it is by his contributions to medical literature that he is best known, having edited the 'College and Clinical Record' 1880-99, and written constantly for the leading medical journals. He was also one of the original editors of the Philadelphia 'Medical Times.' He revised and edited the following works of his father: 'History of Medicine' (1872), and 'Medical Lexicon' (1874); translated Guersant's 'Surgical Diseases of Children' (1873); and was author of: 'The Practitioner's Reference Book' (1878); 'Elementary Physiology' (1879); 'The Present Treatment of Disease' (1886).

Dunglison, Robley, American physician: b. Keswick, England 4 Jan. 1798; d. Philadelphia 1 April 1860. He was educated in medicine at London and Erlangen, and appointed professor

of medicine in the University of Virginia in 1824. In 1833 he was elected to the chair of therapeutics in the University of Maryland, and in 1836 professor of the institutes of medicine in the Jefferson Medical College of Philadelphia. He published about 20 volumes treating of subjects connected with medical science. They were widely circulated and highly valued in their day, one of them, a 'Dictionary of Medical Science and Literature,' being republished as late as 1874.

Dun'ite, a heavy, dark, very basic igneous rock of the peridotite group. It contains no felspar and consists essentially of olivine and chromite. It is believed that most workable deposits of chrome iron ore were formed by local segregations of chromite in a cooling dunite magma, at least the chromite deposits of North Carolina probably had such an origin. Dunites in common with other rocks of the peridotite group change readily to serpentine, and most deposits of chromite occur in serpentine. See PERIDOTITE.

Dun'kards, Dunkers, or Tunkers (Ger. *tunkn*, to dip, Lat. *tingere*, Gr. *τέγγω*) a sect of German-American Baptists, founded by Alexander Mack in 1708 in Westphalia. Persecution at home drove them across the Atlantic. Their doctrines resemble those of the Mennonites (q.v.). They derive their name from their mode of baptizing by immersion. They reject infant baptism; use great plainness of dress and language; refuse to take oaths or to fight; and anoint the sick with oil in order to effect their recovery, depending on this unction and prayer, and rejecting the use of medicine. Every brother is allowed to speak in the congregation, and their best speaker is usually set apart as their minister, ordaining him by the laying on of hands, attended with fasting and prayer. They also have deacons, and aged women for deaconesses. From among the teachers who have been tried, they choose bishops. An elder among them is, in general, the first or oldest chosen teacher in a congregation which has no bishop. Their annual meeting, which is held about Whitsuntide, is attended by the bishops, teachers, and other representatives chosen by the congregations. The important cases brought before these meetings are, in general, decided by a committee of five of the oldest bishops. They will not go to law, and until lately the taking of interest on money was not allowed among them. They celebrate the Lord's Supper, with its accompanying usages of love feasts, the washing of feet, the kiss of charity, and the right hand of fellowship. They believe in general redemption, though it is with them not an article of faith; but they deny that they are Universalists. From the Dunkers, as a sect, must be distinguished the Seventh Day Dunkers, also called the German Seventh Day Baptists. They were established by Conrad Beissel, a native of Germany, who had been educated for the ministry at Halle. When a member of the Dunker society at Mühlbach (Mill Creek), in Lancaster County, Pa., he published (1725), a tract, to prove that the seventh day, and not the first day, was established by Jehovah for ever as the Sabbath. This created some disturbance in the society at Mill Creek, upon which he retired from the settlement and went secretly to a hermitage on the banks of the Cocalico. Having been discov-

ered, and joined by many of the society at Mill Creek, who settled around him in isolated cottages, the first community of Seventh Day Dunkers was established in 1728. In 1733 a monastic society was established, constituting with the buildings subsequently erected by the community, the irregular enclosed village of Ephrata. The habit of the capuchins or white friars was adopted by both the brethren and sisters. Monastic names were given to all who entered the cloister. In 1740 there were 36 single brethren in the cloister and 35 sisters, and at one time the society, including the members living in the neighborhood, numbered nearly 300. The property which belonged to the society by donation, and the labor of the single brethren and sisters were common stock; but none were obliged to throw in their own property or give up any of their possessions. They considered celibacy a virtue, but never required it, nor did they take any vows in reference to it. When two wished to be joined in wedlock, they were aided by the society. In the earlier days the idea of a universal restoration existed among them; but it has never been taught as an article of faith, and is always approached with caution. The Dunkards in this country have dispersed themselves through almost every State of the Union, especially Pennsylvania, Maryland, Virginia, Ohio, and Indiana. In 1900 they reported 2,998 ministers; 1,129 churches; and 111,481 communicants. See GERMAN BAPTIST BRETHERN.

Dunkin, Edwin, English astronomer: b. Truro 19 Aug. 1821; d. 26 Nov. 1898. In 1838 he joined the staff of the Royal Observatory at Greenwich, becoming in 1881 chief assistant, a post which he resigned in 1884. In 1845 he was elected a Fellow of the Royal Astronomical Society, and in 1876 of the Royal Society. From 1884 till 1886 he acted as president of the former body. He published several works, among which are: 'On the Movement of the Solar System in Space determined from the Proper Motions of 1,167 Stars' (1863); 'On the Probable Error of Transit Observations' (1860-64); 'The Midnight Sky: Familiar Notes on the Stars and Planets' (1869); 'Obituary Notices of Astronomers' (1879).

Dunkirk, dūn'kèrk (Fr. *Dunkerque* or *Dunquerque*), France, town in the department of Nord, on the coast of the North Sea, 40 miles northwest of Lille, at the junction of several canals. Of the public squares, that of Champ de Mars and that adorned by a statue of Jean Bart (1845) are the most noteworthy. There are several interesting churches, among the chief being the church of St. Eloi, built about 1560, with a fine tower about 300 feet high, now used as a belfry; the chapel of Notre-Dame des Dunes, founded in 1405 and restored in 1815; and the convent and church of St. Jean-Baptiste. Dunkirk is well protected by several forts, both on the land side and on that of the sea. Its manufactures are extensive, comprising fishing-nets, ropes, sail-cloth, straw hats, starch, soap, leather, earthenware, oil, and chemicals, besides distilling, sugar-refining, and other industries. Dunkirk is the chief port of departure of the French Iceland fishing fleets. The trade is extensive and important. Dunkirk was a town under its present name, which means "the

DUNKIRK — DUNN

church of the dunes," in the 9th century. It has played a prominent part in many wars, and has been besieged on many occasions. The present commercial importance of Dunkirk dates from the period of the second empire. One of the most famous natives of the town is Jean Bart (1651-1702), the celebrated seaman. Pop. 40,215, with the suburbs Rosendael and Saint-Pol-sur-Mer, about 55,000.

Dunkirk, N. Y., city in Chautauqua County; on Lake Erie, and the Erie, the Nickel Plate, the Lake Shore, the Western N. Y. & P., and the Dunkirk, All. V., and P. R.R.'s; 40 miles southwest of Buffalo. It is a good shipping port, having a good harbor and facilities for freight handling. Its industries include a plant for the manufacture of locomotives, foundry, planing-mills, grain-mills, grain and coal elevators, and various other factories. It is a popular summer resort, with a beautiful park overlooking Lake Erie, and has a public library, orphan asylum, public and parish schools, and a national bank. Pop. 12,500.

Dunlap, William, American dramatist and painter: b. Perth Amboy, N. J., 19 Feb. 1766; d. New York 28 Sept. 1839. He painted George Washington's portrait and for five years (1784-9) worked under West in London. Returning to America he wrote several successful plays, including: 'The Father' (1789), a comedy; 'Leicester' (1794), a tragedy; 'André' (1798), a tragedy. He also published: 'Life of George Frederick Cooke' (1813); 'Life of Charles Brockden Brown' (1815); 'History of the American Theatre' (1832); 'History of the Rise and Progress of the Art of Design in the United States' (1834); and similar works. He was one of the founders of the National Academy of Design.

Dunlin (*Tringa alpina*), a bird of the genus to which the least and pectoral sandpipers, knot, and stint belong. It is smaller than the common snipe; is in winter ashy-gray above, white below, with dark spots on the breast; in the breeding season it is mottled with rufous above and the breast is crossed with black. The straight bill is adapted for boring in soft soil, and its cavity reaches to the extremity, not, as in the snipe, stopping short of the tip. The dunlin is one of the most common shore birds in northern Europe and Asia, and sometimes wanders into North America, where it is replaced by the closely allied redbacked sandpiper. In Scotland there are several local varieties, those of the east being a half larger than those of the Hebrides. It breeds on moors and marshes along with the snipe and plover, returning after the breeding season to the sandy and muddy reaches of the coast. See SANDPIPER.

Dunlop, George Thomas, American capitalist: b. Otterburn, Frederick County, Md., 25 March 1845. He entered business at 15, and set up for himself as G. T. Dunlop & Co. in 1870, retiring from business with a fortune in 1890. He was for many years director of the Washington & Georgetown Railroad Company, of which he was elected president in 1894. When this company obtained extensive new franchises from Congress, and changed its name to the Capital Traction Company in 1895, he was elected president of the new corporation.

Dunmore, John Murray, EARL OF, English colonial governor: b. 1732; d. Ramsgate, England, May 1809. He was appointed governor of New York in 1770, and governor of Virginia in 1771. He dissolved the Virginia Assembly in 1772, and again in 1774 when it had resolved to keep the day of the closing of the port of Boston as a day of fasting and prayer. In 1775 he removed a powder magazine to one of the English war ships, and the people incensed at this, began armed resistance under the leadership of Patrick Henry. Dunmore was forced shortly after to take refuge on his fleet, and kept up a predatory warfare against the colonists, burning Norfolk in 1776. He was driven from his position on Gwynn's island and finally sent the fleet to the West Indies, and returned to England. He was appointed governor of the Bahamas in 1786. See COLONIAL WARS IN AMERICA.

Dunmore, Pa., a borough in Lackawanna County, on the Erie & L. R.R.; two miles northeast of Scranton. It is the centre of a coal mining district, and has manufactures of silk, iron, and brick. Several public institutions are located here, the principal one being the State Oral School for the deaf and dumb. Pop. 12,600.

Dun'mow, Great and Little, two parishes of England, in the county of Essex. The former contains the market-town of Great Dunmow, on a height above the Chelmer, 32 miles northeast of London. At Little Dunmow are remains of a stately Augustinian priory, founded in 1104. The Dunmow fitch of bacon was a prize instituted in 1244, by Robert Fitzwalter, on the condition "that whatever married couple will go to the priory, and kneeling on two sharp-pointed stones, will swear that they have not quarrelled nor repented of their marriage within a year and a day after its celebration, shall receive a fitch of bacon." The prize was first claimed in 1445, 200 years after it had been instituted. After 1751, up to which date only five presentations had taken place, the fitch was not again claimed till 1855; between 1860 and 1877 there were four awards; and three in 1891.

Dunn, Gertrude Colmore Renton, English novelist. She was educated in Germany and Paris, and in 1882 was married to H. A. C. Dunn. After his death she was married in 1901 to H. B. Weaver. She has published: 'Concerning Oliver Knox' (1888); 'A Conspiracy of Silence' (1889); 'A Living Epitaph' (1890); 'A Valley of Shadows' (1892); 'A Daughter of Music' (1894); 'Poems of Love and Life' (1896); 'Love for a Key' (1897); 'Points of View' (1898); 'The Strange Story of Hester Wynne' (1899); 'The Marble Face' (1900).

Dunn, Jacob Piatt, American journalist and author: b. Lawrenceburg, Ind., 12 April 1855. He was educated at Earlham College, Ind., and Michigan University, and was State librarian of Indiana 1889-93, when he became an editorial writer on the Indianapolis *Sentinel*. Since 1886 he has been secretary of the Indiana Historical Society. He has published: 'Massacres of the Mountains, a History of the Indian Wars of the Far West' (1886); 'His-

DUNNAGE — DUNS

tory of Indiana' (1888), in the 'American Commonwealth Series'; 'The Tax Law of Indiana and the Science of Taxation' (1891); 'The Libraries of Indiana' (1892); 'The World's Silver Problem' (1894).

Dun'nage, a nautical term applied to loose wood or other miscellaneous substances, used in the hold of a ship to lift the cargo above bilge-water. Again, such articles as old mats or sails stowed among casks and other cargo, to prevent their motion and breakage. See CHOCKS.

Dunne, Edward Joseph, American Roman Catholic clergyman: b. Tipperary, Ireland, 1848. He came to the United States when an infant, was educated at the theological seminary in Baltimore, and ordained priest in 1871. He was appointed bishop of Dallas, Texas, in 1893. His diocese grew steadily under his administration till in 1900 it contained 32 churches and 21 parochial schools.

Dunne, Finley Peter, American journalist and humorist: b. Chicago 10 July 1867. He was educated in the Chicago public schools and entered journalism in 1885. He was city editor of the *Chicago Times* 1891-2; was on the editorial staff of the *Chicago Evening Post* and *Times-Herald* 1892-7; and editor of the *Chicago Journal* 1897-1900. He is author of 'Mr. Dooley in Peace and War' (1898); 'Mr. Dooley in the Hearts of His Countrymen' (1898); 'Mr. Dooley's Philosophy' (1900); 'Mr. Dooley's Opinions.'

Dun'net Head, a promontory of Scotland, in Caithness, at the western entrance of, and projecting into the Pentland Firth; the most northern point of the mainland of Great Britain. It rises to the height of 400 feet above sea-level. On the northwestern extremity is a lighthouse 346 feet high.

Dunning, Edwin James, American author: b. Camillus, N. Y., 19 July 1821; d. Cambridge 1901. He practised dentistry at Ithaca and Syracuse, N. Y., 1838-44, and in New York 1844-74. In 1877 he lost his eyesight and took up the study of literature. He published: 'Genesis of Shakespeare's Art: a Study of His Poems and Sonnets' (1897).

Dunning, John, (BARON ASHBURTON), English lawyer: b. Ashburton, Devonshire, 18 Oct. 1731; d. Exmouth, Devonshire, 18 Aug. 1783. He established his reputation in 1762 by drawing up a defense of the East India Company against the claims of the Dutch; and his already large practice was immensely augmented by his arguments on the side of Wilkes in the question of the general warrants. In Parliament he remained a firm opponent to the ministry who conducted the American war; and on the return of Lord Shelburne to power in 1782 he was made chancellor of the duchy of Lancaster, and advanced to the peerage.

Dunning, William Archibald, American educator: b. Plainfield, N. J. He was graduated at Columbia 1881, and became successively fellow 1886-8; prize lecturer in political science 1887-9; instructor in history 1889-91; and professor of history and lecturer on political theory since 1891. In 1894 he became managing editor of the 'Political Science Quarterly,' to which he has contributed over 60 important articles and reviews. He has pub-

lished: 'Essays on the Civil War and Reconstruction, and Related Topics' (1898); 'History of Political Theories, Ancient and Medieval' (1902).

Dunnottar, dūn-nōt'tar, a parish of Kincardineshire, Scotland, famous for its ancient ruined castle. The older part of the ruins probably belongs to about 1394, when the castle was rebuilt by Sir William Keith, marischal of Scotland. During the Commonwealth the castle was selected as the strongest place in the kingdom for the preservation of the Scottish regalia. Lambert, one of Cromwell's generals, besieged the place, which was starved into capitulation. The regalia had, however, been previously removed by a stratagem, in which Mrs. Granger, the wife of the minister of an adjoining parish, played the chief part. She brought away the crown hid among some clothes in her lap, her servant-maid carrying the sword and sceptre in a bag of flax on her back. In Dunnottar churchyard, near Stonehaven, Sir Walter Scott met Robert Paterson, the original "Old Mortality."

Dunois, Jean, zhōn dü-nwā, COUNT OF ORLEANS AND OF LONGUEVILLE, French soldier: b. Paris 23 Nov. 1402; d. St. Germain-en-Laye, near Paris, 24 Nov. 1468. He was a natural son of Louis, Duke of Orleans, and made the name "Bastard of Orleans" illustrious by his military exploits in the war for the liberation of France, then completely in the power of England. Being besieged by the English he defended Orleans with the greatest courage until relieved by the Maid of Orleans. To Dunois belongs almost entirely the honor of expelling the enemies of his country from Normandy and Guienne. In 1450 he had completely freed France from the presence of the English, and it may truly be said that Charles VII. was indebted to him for his crown. Dunois received from him the title of "deliverer of his country," the county of Longueville, and the dignity of high chamberlain of France.

Dunoon, dūn-oon', Scotland, a celebrated watering-place in the county of Argyle, on the shore of the Firth of Clyde, 25 miles west by north from Glasgow. There is an immense passenger traffic here in the summer season carried on by means of the Clyde steamers. On a hill are the ruins of Castle Dunoon, the ancient residence of the Argyles.

Dunquerque. See DUNKIRK, France.

Dunra'ven, Windham Thomas Wyndham-Quin, 4TH EARL OF: b. Adare, Ireland, 12 Feb. 1841. He was educated at Christ Church, Oxford; was war correspondent for the *Daily Telegraph* in Abyssinia in 1867 and again in the Franco-Prussian war, and succeeded to the title in 1871. He was under-secretary for the Colonies in Lord Salisbury's two administrations, but resigned in 1887. He is a traveler and yachtsman and has published: 'The Great Divide: the Upper Yellowstone' (1874); 'The Irish Question' (1880); 'Self Instruction in the Theory and Practice of Navigation' (1900).

Duns, John, Scottish physicist: b. 11 July 1820. He was educated at Edinburg University and entered the ministry of the Free Church of Scotland in 1843. He was pastor at Torphichen in 1844; editor of 'North British Review' (1857), and has been professor of natural sci-

DUNSINANE — DUNWOODY

ence in New College, Edinburgh from 1864. Among his published works are: 'Things New and Old' (1857); 'Biblical Natural Science' (1863-6); 'Science and Christian Thought' (1866).

Dunsinane, dŭn-sĩ-nān', one of the Sidlaw Hills in Perthshire, 1,012 feet high, nine miles northeast of Perth. On its top are remains of a fortress "Macbeth's Castle." Here Siward defeated Macbeth in 1054. Shakespeare made use of this battle in his 'Macbeth.'

Dun'stan, Saint, English prelate and statesman: b. Glastonbury about 924; d. Canterbury 19 May 988. His family was a notable one and related to the royal line of the Anglian kings. He was educated in whatever of science and liberal arts existed in that time, by certain Irish monks settled at Glastonbury, and he was proficient in music (including music composition), in painting, and the mechanic arts. His career proves him to have been gifted with administrative talents of the first order. At an early age he entered the service of King Athelstan and continued in that of his successor Edmund, but his superior accomplishments provoked the enmity of his rivals at court, by whom he was set upon with outrageous violence and driven out. He then went to his uncle, Ælpheg, bishop of Winchester, and when convalescent from an attack of brain fever brought on by the rough handling to which he had been subjected, took the religious vows and became a monk. He now entered upon a course of asceticism, such as was in that age deemed to be the most perfect way to heaven and an essential part of the life of whoever would walk in Christ's footprints; and hence from the time of the change of religion in the 10th century until lately Dunstan has been rated by those outside of the Roman Catholic Church merely as a fanatical and grossly superstitious monk, and his wisdom as churchman and statesman reputed as "monkish cunning." But modern historic research has begun to do justice to this man, who was without question an enlightened statesman and a wise Church reformer.

At the age of 22 he was made abbot of Glastonbury by King Edmund, who also appointed him principal state treasurer. Under Edmund's successor Edred (946-55), who was of feeble constitution, Dunstan was in all but name ruler of the kingdom and a wise and vigorous administrator. Under Edwy, who succeeded Edred, he courageously sought out the king while he was in the company of his destined bride, Elgiva, and to his face denounced the intended union as incestuous. For this action he was outlawed and for a few months was in exile at Ghent; but when Edwy's brother Edgar, a youth, became king of Mercia and Northumberland, he chose Dunstan for his chief minister and at the same time he was appointed bishop of Winchester; in 960 he was promoted to the primatial see of Canterbury. Now it was that Dunstan, as archbishop of Canterbury and principal minister of state, began to execute fully the policy for which his memory has been execrated in modern times. He forcibly expelled from all abbeys, cathedrals and churches to which his power as minister of state extended, all married and concubinary priests, supplanting them with monks where he could; and making the canons of his own cathedral chapter a mo-

nastic college. In dispossessing the married clergy he simply enforced the laws of the Church which required her ministers to be celibate; and in reforming his cathedral chapter he appears to have exercised a wise discretion; there were evils rampant in the Church in those times that cried out for stern correction. In that same reign, in which he was all-powerful, he induced the king to visit in person every part of his realm annually, holding courts of justice, hearing appeals, and becoming acquainted with the needs of the people. A strong fleet was maintained off the coast against the Norse pirates; the coinage was reformed; rewards were paid by the Crown for the extermination of beasts of prey. Edgar's successor, Edmund, owed chiefly to Dunstan his elevation to the throne, and the archbishop continued still to be principal minister of state; but when Edmund was murdered, 979, the archbishop's influence under his successor, Ethelred, "the unready," was small, and disasters befell the kingdom thick and fast; the Danes ravaging the coasts and pillaging and slaughtering the people inland. The archbishop passed the closing years of his life in retirement, going back to the favorite studies and pursuits of his youth—music, painting, calligraphy, the making of musical instruments, and bell-founding. Consult: Stubbs, 'Memorials of Saint Dunstan'; Butler, 'Lives of the Saints'; Starr, 'Patron Saints'; Osborn; Eadmer.

Dun'ster, Henry, 1st president of Harvard College: b. Lancashire, England, about 1612; d. Scituate, Mass., 27 Feb. 1659. He was inaugurated president Aug. 27, 1640, and held his office until 1654, when, having become a supporter of the principles of the modern Baptists, he was persuaded to resign his office. He was respected as a modest and pious man, and esteemed an excellent Oriental scholar.

Dunton, John, English bookseller and author: b. Grafton, Huntingdonshire, 4 May 1659; d. 1733. He came to New England in March, 1686, with a cargo of books and remained about eight months. He conducted a weekly called the 'Athenian Mercury,' resolving all the curious questions proposed by the inquiring, of which 20 volumes appeared. A selection from this was made, called the 'Athenian Oracle.' He wrote voluminously on religion, ethics, and politics, filling his works with information which is no less entertaining for being subservient to the author's vanity. Among his writings are: 'Life and Errors of John Dunton'; and 'Letters from New England,' which was published in 1867. In this he relates many curious facts in relation to the bookselling business, describing the ministers, booksellers, and other citizens of Boston and Salem.

Dunwoody, Henry Harrison Chase, American meteorologist: b. Highland County, Ohio, 23 Oct. 1842. He was graduated at the U. S. Military Academy in 1866 and from the Columbia Law School in 1876 and having been detailed in 1872 for duty on the Signal Corps, was appointed in 1891 to the Weather Bureau, then first constituted. His special work has been that of formulating official forecasts of the weather, and he originated the system of cold-wave warnings; in this connection he recommended the organization of State weather services. He is the author of many papers on

meteorological subjects published by the Signal Service.

Duodecimal Scale. See ARITHMETIC; SCALE.

Duodecimal System, in numeration, a system of numbers the scale of which is 12. Duodecimals is a term applied to an arithmetical method of ascertaining the number of square feet, etc., in a rectangular area or surface, whose sides are given in feet, inches, and lines. In recent times it has been proposed to substitute for the present decimal scale of 9 digits and a cipher a duodecimal scale of 11 digits and a cipher, thus making 12 its base. In favor of the system it is urged that 12 admits of a greater number of division into equal parts by 2, 3, 4, and 6; but most mathematicians consider it as not having sufficient superiority over decimals to counterbalance the immense inconvenience of making a change. The great superiority of duodecimals in the practical, everyday affairs of trade, commerce, and ordinary business is so great, that no laws in any manufacturing or commercial country can be made that can compel the use of decimals to the displacing of dozens and grosses.

Duodenitis, dū-ō-dē-nī'tis, a term used in pathology, is inflammation of the duodenum, the first portion of the small intestine. It frequently results from an acute gastric irritation and is, in a large number of cases, the affection which causes biliousness. The main symptoms are headache, languor, nausea, loss of appetite, constipation, coated tongue, foul breath, and, at times, a certain amount of jaundice. This latter is due to the fact that the inflammation in the duodenum causes a swelling of the mucous membrane of the common bile duct and leads to partial occlusion of its passage, thus damming back a certain amount of bile, hence the term biliousness. The treatment is by means of careful diet, hot water and hygienic living. See INTESTINE; ENTERITIS.

Duodenum, dū-ō-dē'nūm, in anatomy. See INTESTINE.

Dupanloup, Félix Antoine Philibert, fā-lēks ān-twān fē-lē-bēr dii-pān-loo, French prelate and theologian: b. St. Félix, Savoy, 3 Jan. 1802; d. Lacombe, Isère, 11 Oct. 1879. He received a clerical education at Paris and after ordination to the priesthood was appointed chaplain to the Count of Chambord and religious instructor of the young princes of the house of Orleans. In 1837 he was made one of the vicars-general of the archbishop of Paris and head of the Petit Séminaire de St. Nicolas du Charbonnet which, under his direction, ceasing to be merely a preparatory school for aspirants to the clerical state, received as students the sons of the highest nobility. Ernest Renan, who was one of the clerical students, recounts in his 'Recollections of My Youth' a pleasing anecdote illustrating "the noblest trait in Dupanloup's character," his affection for his mother. It was Dupanloup who in 1838 attended Talleyrand on his death bed as minister of religion, and brought about what passed for a reconciliation of the apostate bishop with the Church. Renan reports Talleyrand as having remarked when told that the Abbé Dupanloup was to offer his ministrations, "This young man does not know his business"; but in Renan's judgment "never was there priest so well up in his calling." All his

life Dupanloup took a lively interest in charitable projects and in measures for extending to the masses the benefits of school education. He combated the endeavors of that party in the Church which sought to displace in institutions of higher education the ancient Greek and Latin classics as being pagan, and to substitute in their room the Fathers of the Church—the Basils, the Chrysostoms, the Augustins and the Jeromes. He was made bishop of Orleans 1849; was elected to the French Academy 1854; but withdrew in 1871 when against his earnest protest Littré, the leader of the Positivists, was chosen to be a member; that same year he was elected to the National Assembly and was several times re-elected; in the Assembly he was the leader of the clerical party, so-called, and ever took an active part in discussions of matters of public education. In the Vatican Council he stood with the minority in opposition to the decree of infallibility, but was one of the first to make an act of submission. Nominated 1871 to be archbishop of Paris, he declined that office. He was a great pulpit orator, worthy of a place beside the great sacred orators of France. His writings are voluminous, dealing almost wholly with questions of education and church interests. Two of his works which are in every good pedagogical library are: 'The Child' and 'The Ministry of the Catechist.' Consult: Pelletier, 'Monseigneur Dupanloup.'

Dupaty, Charles Marguerite Jean Baptiste Mercier, shārl mar-gā-rēt zhōn bāp-tēst mār-sē-ā dū-pā-tē, French jurist: b. La Rochelle, France, 9 May 1746; d. Paris 17 Sept. 1788. In 1767 he became advocate-general to the parliament of Bordeaux, and having written in its name against the Duke of Aiguillon, when this nobleman became minister (1770) he was sent to Pierre-en-Cise (a fortress at Lyons, once a state prison), and afterward banished until the accession of Louis XVI. The memorial by which he preserved the lives of three innocent citizens of Chaumont who were condemned to the wheel deserves particular mention. His other works are: 'Reflexions Historiques sur les Loix Criminelles,' a valuable work; various 'Discours Académiques'; and 'Lettres sur l'Italie en 1785,' which appeared in 1788.

Dupaty, Louis Marie Charles Mercier, loo-ē ma-rē shārl mār-sē-ā, French sculptor: b. Bordeaux 29 Sept. 1771; d. Paris 12 Nov. 1825. He was a son of the preceding. He was the restorer of sculpture in France, a member of the Institute, and professor in the École des Beaux Arts; was at first an advocate, served during the Revolution as a dragoon, then as cartographer, and finally went to Rome, where he studied sculpture and made himself known by numerous works. His principal productions are 'Ajax Pursued by Neptune,' his equestrian statue of Louis XIII. (1816), and 'Orestes Pursued by the Furies.'

Duperré, Victor Guy, vêk-tōr gē dū-pē-rā, BARON, French naval officer: b. La Rochelle 20 Feb. 1775; d. Paris 2 Nov. 1846. After various gallant naval adventures Duperré in 1811 was raised to the rank of vice-admiral, and commanded in the Mediterranean. In the beginning of 1812 he was naval commander-in-chief in the Adriatic, and during the Hundred

Days guarded Toulon against the attempts of the British and Sicilian troops which landed at Marseilles. In 1823 he commanded the squadron employed in the siege of Cadiz. In 1830 he superintended the landing of the troops on the coast of Algiers, and contributed greatly to the capture of the capital. After the Revolution of July he was raised to the peerage, and held the portfolio of marine, first from 1834 to 1836, and again in the ministry of 1840.

Duperron, Jacques Davy, zhāk dā-vē dü-pě-rôn, French ecclesiastic: b. St. Lô, Normandy, 15 Nov. 1556; d. Paris 6 Sept. 1618. His father, a physician, having embraced the Reformed religion had to flee from France and settled at Bern in Switzerland, where he became a Protestant minister. The son, having received at Bern a superior education, came to Paris at the age of 20, and having been there received into the Roman Catholic Church was appointed reader to the king, Henry III., and afterward adopted the clerical profession. He pronounced the eulogy of Mary Queen of Scots, after her execution, and seized the opportunity to make an attack on Queen Elizabeth; and though the French court disavowed any approval of the discourse and expressed a formal censure of it, the incident marked the beginning of the young ecclesiastic's good fortunes. In the matter of the Cardinal de Bourbon's plot to succeed to the throne after the death of Henry III., he was charged with having joined the Cardinal's faction and betrayed its secrets to Henry of Navarre (Henry IV.). The charge seemed to get confirmation from the fact that after Henry ascended the throne he made Duperron bishop of Evreux. He was the Church's agent in bringing about Henry's conversion to the Roman Catholic faith. In his diocese of Evreux he had great success in checking the advance of Calvinism and bringing seceders back to the Church. He was in Rome on the king's business in 1604 when Clement VIII. died, and was largely instrumental in securing the election first of Leo XI. and then of Paul V., who in less than a month succeeded Leo. He was now made archbishop of Sens and cardinal. Contrary to the principles of Gallicanism he was a zealous advocate of the doctrine of papal infallibility and of the Pope's superiority over a general council of the Church.

Dupetit-Thouars, dü-pě-tê too-är, **Abel Aubert**, French naval captain: b. Boumois, Saumur, 31 Aug. 1760; d. 1 Aug. 1798. When a mere boy he was so smitten with the love of a sea life by reading 'Robinson Crusoe' that he ran off from the military school of Laflèche and attempted to enter himself as a cabin-boy in a vessel at Nantes, but was discovered and sent back. At length, in 1778, he had an opportunity of entering the navy, and distinguished himself on several occasions in the West Indies. On the expedition to Egypt in 1798 he commanded an 80-gun ship. He foresaw the only result which could be anticipated if it was resolved to wait for Nelson's attack in the place selected in the roads of Aboukir, and advised immediately to set sail. But though his advice was disregarded he fought with undaunted valor against the enemy, and fell in the struggle. His MSS. and correspondence

were published under the title of 'Lettres, Mémoires et Opuscules d'Aristide Dupetit-Thouars.'

Dupin, André Marie Jean Jacques, än-drä mä-rê zhôn zhāk dü-pân, French lawyer and advocate: b. Varzy 1 Feb. 1783; d. Paris. He attained first rank at the French bar, defending Marshal Ney and Beranger. He was the eldest of the famous brothers styled "the three Dupins."

Dupin, Jean Henri, zhôn ön-rê, French dramatist: b. Paris 1 Sept. 1791; d. there 5 March 1887. He was a brother of André Dupin (q.v.). His plays were staged with great success.

Dupin, Louis Ellies, French church historian: b. Paris 17 June 1657; d. there 6 June 1719. In 1680 he received the degree B.D. at the Sorbonne, and in 1684 the degree D.D., and then or previously commenced those researches into the history of the Church which resulted in his celebrated 'Universal Library of all the Ecclesiastical Writers' (Vol. I., 1686). The freedom with which in this volume he discussed the teachings of the Fathers of the Church brought upon the work its condemnation by the archbishops of Paris and it was suppressed; but the author having made a retraction and changed "universal" in the title to "new," he was permitted to continue the series, though later he was banished, and restored only after a new retraction. He sought to effect a union between the Anglican and Gallican churches and had a correspondence to that end in 1718 with the Anglican primate, Archbishop Wake. He was now charged with endeavoring to subvert the dogmas of the Roman Catholic Church, and his papers were seized in 1719, in the expectation that they would give proof of the charge; but nothing was found that seriously compromised him. He seems to also have conferred with Peter the Great with a view to union of the Gallican and Russian churches. The 'Library of Ecclesiastical Authors' is a very voluminous work of immense erudition and is a complete history of theological literature within the Roman Catholic Church, both Eastern and Western, to the close of the 17th century; it was soon translated into English. Besides this, his greatest work, he wrote many others, among them: 'Universal Library of Historians'; 'Abridgment of Church History'; 'General History from the Beginning of the World to the Present Time' (1712).

Dupin, Pierre Charles François, pē-är shärł frän-swä, French engineer: b. Varzy 6 Oct. 1784; d. Paris 18 Jan. 1873. He was a brother of André and Jean Henri Dupin (qq.v.). He performed many notable engineering feats in the government service, and was made a baron and a senator.

Dupleix, Joseph François, zhō-zěf frän-swä dü-pläks, French colonial governor: b. Landrecies, France, 1 Jan. 1697; d. Paris 10 Nov. 1764. In 1720 he was appointed to a seat in the council at Pondicherry. Ten years later he became superintendent at Chandernagore in Bengal. The remarkable success of his administration here led to his being appointed, in 1741, governor-general of all the French Indies, with the title of Nawab. He now successfully pursued that policy of patient, skilful

DUPONCEAU — DUPONT

diplomacy among the native princes which at one time made the Carnatic almost a French province. When war broke out in Europe between France and England (1740), several brilliant engagements planned by Dupleix took place between the French garrison and the troops of the Nawab of the Carnatic, who endeavored to take possession of Madras, but was precipitately forced to raise the siege. An attack on the English at Fort St. David failed, but Dupleix's science and courage were displayed in the defense of Pondicherry, which Admiral Boscawen in vain attacked for five weeks, with an apparently overwhelming force, but was forced to retire discomfited, though the defense was conducted by a civilian, unsupported by a single general of repute. The ambitious mind of Dupleix had long formed the project of founding a French empire in India on the ruins of the Mogul monarchy, but his military designs, able as they were, were frustrated by the energy and military genius of Clive and Lawrence. The struggle continued till 1754, in which year Dupleix was recalled by Louis XV.

Duponceau, dü-pôn'sō, Fr. dü-pôn-sō, Peter Stephen, American lawyer and scholar: b. St. Martin, Isle de Ré, France, 3 June 1760; d. Philadelphia 1 April 1844. For a time he was secretary to Count de Gêbelin, and afterward to Baron Steuben, with whom he came to the United States in 1777. Receiving a captain's commission he served with Steuben through the American Revolution and after its close settled in Philadelphia and became noted as a lawyer. For several years he was much interested in an effort to introduce into the United States the production and manufacture of silk. His writings are of a miscellaneous character, among which may be mentioned original treatises on points of law; translations from the Latin, German, and French on similar subjects; various treatises on philology; numerous contributions to American history, including a translation of 'A Description of New Sweden,' by Thomas Campanius Holm. He was a member of more than 40 literary and scientific institutions of Europe and America, including the American Philosophical Society, the Historical Society of Pennsylvania, and the Philadelphia Athenæum, of which three institutions he was the presiding officer at the time of his death.

Dupont, dü-pönt', Henry Algernon, American military officer: b. Wilmington, Del., 30 July 1838. He is a grandson of E. I. Dupont (q.v.). He was graduated at the United States Military Academy, served through the Civil War, taking part in the battles of Piedmont, Lynchburg, Cedar Creek, Opequan, and Fisher's Hill, and was brevetted major-general for gallantry in the two last-mentioned battles, and lieutenant-colonel for services at Cedar Creek. He became proprietor of the celebrated powder mills bearing his name near Wilmington, Del., and under his direction they became an important factor in the Civil War. He resigned from the army in 1875; became president of the Wilmington & Northwestern Railroad Company in 1879; and was chosen United States senator from Delaware in 1895, but was not seated.

Dupont, Jacques Charles, zhāk shärl dü-pôn, surnamed *De l'Eure*, French statesman: b. Neubourg, Normandy, 27 Feb. 1767; d. Rouge-Pierre, Normandy, 3 March 1855. In

1798 he was a member of the Council of the Five Hundred, which was dispersed by Murat on the 18th Brumaire. In 1811 he was nominated president of the court of justice at Rouen, and in 1813 vice-president of the corps législatif. On the restoration of the Bourbons Dupont signalized himself as a leader of the opposition. In 1830, after the revolution of July, he was made minister of justice, and after the fall of Louis Philippe became a member of the provisional government. On the accession of Napoleon III., in 1852, he ceased to take part in public affairs. Dupont was called by his political friends the "Aristides of French liberalism."

Dupont, Pierre, pê-är, surnamed *DE l'ETANG*, French soldier: b. Chabanais 14 July 1765; d. Paris 7 March 1840. He served first with the French Legion in the Dutch service, and in 1791 in the French army. By his skilful arrangements as a staff officer, he prevented Denmark from falling into the hands of the Duke of York, and was promoted to the rank of brigadier-general. After the proceedings of the 18th Brumaire, in which he took an active part, he was appointed head of the general état-major of the army of reserve assembled at the foot of the Alps, and distinguished himself in Italy at the battle of Marengo. In 1805 he joined the army in Germany, where he freed Marshal Mortier when hemmed in by a body of Russian troops. He was also very active in the campaign of 1806 against the Prussians, and in 1807 contributed by his skilful tactics to the victory of Friedland. In 1815 he was elected member of the Chamber of Deputies by the department of Charente, and retained his seat with some interruptions till the revolution of July.

Dupont, Pierre, French political song writer: b. Lyons 23 April 1821; d. St. Etienne 25 July 1870. After issuing a volume of poems in 1844, he went to Paris and obtained a place in the office of the secretary of the Institute. After the revolution of February 1848 he came forward as the minstrel of socialism, and proved obnoxious to the government which came into power in December 1852. He was condemned to be banished for seven years; but the intercession of his friends soon procured his release. After that event he spent a gay and careless life by the Rhone. His songs did not bring him fortune, and he died comparatively poor. His works (songs and music) appeared in 1854 in four volumes 8vo.

Dupont, dü-pönt', Samuel Francis, American naval officer: b. Bergen Point, N. J., 27 Sept. 1803; d. Philadelphia 23 June 1865. During the Mexican war, being then a commander, he saw much active and gallant service on the California coast. In 1862 he was put in command of the South Atlantic blockading squadron, and was promoted to rear-admiral in August 1862. He was in command of the ironclad squadron of nine vessels which attacked Charleston, S. C., 7 April 1863, but was repulsed with considerable loss. He greatly contributed to the organization of the Naval School at Annapolis, and was the author of a very remarkable report on the use of floating batteries for coast defense.

Dupont, Victor Marie, American manufacturer: b. Paris, France, 1 Oct. 1767; d. Philadelphia, Pa., 30 Jan. 1827. He was a son

DU PONT DE NEMOURS — DUPRE

of Pierre Samuel Dupont De Nemours (q.v.), and entered the diplomatic service as attaché to the French legation in the United States in 1787; became secretary of legation in 1795 and was appointed French consul in Charleston, S. C., in the same year. In 1798 he was appointed consul-general of France in New York. He returned to France; withdrew from the government service and came to the United States in January 1800. He entered business in New York; removed to Wilmington, Del., in 1809, where he joined his brother and established a cloth manufactory. He was for a time a member of the Delaware Legislature, and a director of the Bank of the United States.

Du Pont de Nemours, Eleuthère Irénée, ā-lū-thār ē-rā-nā dü-pōn dē nē-moor: b. Paris 24 June 1771; d. Philadelphia 31 Oct. 1834; son of the French political economist Pierre Samuel Du Pont de Nemours. He was a pupil of Lavoisier and entered the royal powder mills at Essonne to familiarize himself with the manufacture of gunpowder with a view to succeed Lavoisier as superintendent of the government powder mills, but subsequently abandoned this in 1791 to take charge of the printing and publishing house established by his father in Paris. Being a supporter of King Louis XVI. he was in the utmost peril after 10 Aug. 1792, and after being three times imprisoned and having his printing house sacked and destroyed he emigrated with his father's family to the United States in 1799, arriving at New London, Conn., 1 Jan. 1800. Not long after his arrival attention was called to the poor quality of gunpowder then made in this country and he determined to enter into powder manufacture here. With this in view he returned to France January 1801 to procure at Essonne, plans and models of improved machinery, returning to the United States in August with some of the machinery. Thomas Jefferson, who was deeply interested in this development, urged that the works be built in Virginia, but owing to his views regarding slavery and its effect on the white race Du Pont was unwilling to make his venture either in Virginia or Maryland. In June 1802 he bought a tract of land with a fine water-power on the Brandywine River, near Wilmington, Del. On 19 July he arrived there with his family and began operations which were so successful that, at the time of his sudden death by cholera, his works were the largest of their kind in the country. Since his death they have been carried on by his sons and grandsons and are still among the largest gunpowder works in this country, while they are the centre of the industrial combination in this industry.

Dupont de Nemours, Pierre Samuel, French economist: b. Paris 14 Dec. 1739; d. near Wilmington 6 Aug. 1817. He lived almost unknown in Paris as a private man of letters till 1773, when his principles of philosophy and political economy set forth in his 'Les Ephémérides du Citoyen' excited the displeasure of the minister, Choiseul, and obliged him to leave France. Several foreign princes offered him a reception and conferred honors on him. He returned, however, to his native country and accepted a small place given him by Turgot, minister of finance. In 1782 and 1783, with Dr. Hutton, the English agent, he negotiated the basis of the treaty by which the independence

of the United States of America was acknowledged. As inspector-general of commerce and manufactures, and as a councilor of state, he afterward did much to encourage French industry. After the Directory was abolished he came to the United States in 1798. In 1802 he returned to France, but did not at that time take any office, notwithstanding the offers made him by Napoleon. After Napoleon's return from Elba he settled in the United States where his two sons had already become citizens. Besides various political treatises he is likewise the author of a French translation of the first three cantos of the 'Orlando Furioso.'

Dupont's Smokeless Powder, a hard-grained porous powder, composed of cellulose nitrate of medium nitration which has been formed into grains by suspending the cellulose nitrate in an aqueous solution of barium and potassium nitrates to which amyl acetate is added, stirring the gelatinized material in the fluid until the grains are formed and hardening them by steam until the amyl acetate is expelled. The grains may be separated by sifting into the various desired sizes and colored to meet any taste by the addition of a very small amount of an organic coloring matter. See EXPLOSIVES: POWDER.

Düp'pel, Germany, a fortified village in the province of Schleswig-Holstein, Prussia, on the coast of the Little Belt. The place has been the scene of some severe struggles between the Danes, to whom it formerly belonged, and the Germans. In 1848 the latter were defeated here by the Danes, then the place was retaken by the Prussians, and in 1860 was again in possession of Denmark. After a long siege it was captured by the Prussians in 1864.

Duprat, Antoine, French statesman, archbishop, and cardinal: b. Issoire 17 Jan. 1463; d. Rambouillet 8 July 1535. Under Louis XII. he was president of the parliament of Paris, and in 1515, on the accession of Francis I., became chancellor and prime minister. The chief event of his ministry was the conclusion of the concordat, against great clerical and academic opposition, by which the Church and nobility became subject to the Crown, and by which he nullified the desire of Pope Leo X. to abrogate the Pragmatic Sanction, which in 1438 limited the spiritual power of the Pope in France, and laid the foundation of the so-called Gallican Church. In this direction he was the precursor of Richelieu and Mazarin, in the work of consolidating the power of the state. For his services, he was appointed archbishop of Sens, and later was created a cardinal.

Dupray, Henri Louis, ðñ-rē loo-ē dü-prā, French painter: b. Sedan, France, 1841. He was the pupil at Paris of Pils and Cogniet, and early directed his attention to military subjects. His 'Bataille de Waterloo' (1870) is considered his most important work.

Dupré, Giovanni, jō-vān nē dü-prā', Italian sculptor: b. Siena, Italy, 1 March 1817; d. Florence 10 Jan. 1882. Among his works are: 'Abel'; 'Cain'; 'Sappho'; 'Giotto'; and 'Pieta'; the last representing the dead Christ, supported by his mother.

Dupré, Jules, zhül dü-prā, French landscape painter: b. Nantes 5 April 1812; d. L'Isle Adam 6 Oct. 1880. He began his career as a

painter of porcelain in his father's factory, but when 18 years old went to Paris where his talent soon became recognized. He sent his first picture to the Salon in 1831; was made a chevalier of the Legion of Honor in 1849, and officer in 1870. He received a second-class medal at the Exposition of 1867 and the same at the Exposition of 1883, and a medal of honor at the Exposition of 1889. His studio for some years was in the Forest of Fontainebleau, and later in L'Isle Adam. A number of his pictures are owned in the United States.

Dupuis, Charles François, shärl frän-swä dü-pwé, French scholar: b. Trie-le-Château, near Gisors, 16 Oct. 1742; d. Is-sur-Tille, France, 29 Sept. 1809. In his 24th year he was made professor of rhetoric at Lisieux. His 'Mémoire sur l'Origine des Constellations et sur l'Explication de la Fable par l'Astronomie' (1781) is erudite, but rather sophistical. Later works of his are: 'Origine de tous les Cultes, ou la Religion universelle' (1794); two works on the Pelasgi, which attracted great attention; treatises on the zodiac of Denderah, and on the Phœnix; 'Mémoire explicatif du Zodiaque chronologique et mythologique' (1805).

Dupuis, Nathan Fellowes, Canadian scientist: b. Portland, Ontario, 13 April 1836. He was graduated at Queen's University, Kingston, in 1866, and has been a professor there for 28 years, occupying the chair first of chemistry and natural science, then of mathematics, which he still fills. He is a Fellow of the Royal Society of Canada, and editor of the Canadian 'Educational Monthly.' His published works include 'Elements of Geometrical Optics' (1868); 'Geometry of the Point, Line and Circle in the Plane' (1889); 'Elements of Synthetic Solid Geometry' (1893).

Dupuy, dü-pwé', Eliza Ann, American novel writer: b. Petersburg, Va., about 1814; d. New Orleans January 1881. 'The Conspirators,' her first novel, has Aaron Burr as the principal character. Most of her stories, some 40 in number, were published in the New York 'Ledger.'

Dupuytren, Guillaume, gē-yōm dü-pwē-trän, BARON, French surgeon and anatomist: b. Pierre-Buffière, Haute-Vienne, 6 Oct. 1777; d. Paris 8 Feb. 1835. In 1801 he obtained the situation of overseer of anatomical labors at Paris; and became in 1815 first surgeon to the Hôtel Dieu. In 1823 he was appointed first physician to the king, Louis XVIII., and retained the same situation under Charles X. He possessed extraordinary acuteness in respect of diagnosis, united with remarkable skill and dexterity in the most dangerous operations, in performing which he had a firmness of nerve which was never shaken. He invented several surgical instruments and modes of operation, and also made some discoveries in pathological anatomy. Some of his pupils united in publishing his 'Oral Lectures on Clinical Surgery' (1830-34); and his 'Theory and Practice as to the Treatment of Wounds by Warlike Weapons,' was published in 1834.

Duquesne, dü-kän, Abraham, French admiral: b. Dieppe 1610; d. Paris 2 Feb. 1688. In his 17th year he was in the sea-fight off Rochelle, and distinguished himself during and after the year 1637 in the war against Spain. In 1647 he

commanded the expedition against Naples. Bordeaux, which had rebelled, he reduced, notwithstanding the assistance afforded it by Spain. In the Sicilian war he thrice defeated the combined fleets of Holland and Spain, under the renowned De Ruyter, who was mortally wounded in the last engagement. After he had reduced Algiers and Genoa to the necessity of supplicating the mercy of Louis XIV., the king conferred upon him the estate of Bouchet, and made it a marquisate, with the title of Duquesne. More than this he could not do, because Duquesne was a Protestant. He was, also, the only person exempted from the banishment of his sect, occasioned by the repeal of the Edict of Nantes.

Duquesne, dü-kän', Pa., borough, in Allegheny County; on the Monongahela River, and the Pennsylvania Railroad; about 10 miles from Pittsburg. The industries, chiefly the manufacturing of steel, and iron products, are extensive. Pop. 9,300.

Duquesnoy, François, frän-swä dü-kā nwä, or "FRANÇOIS FLAMAND", Flemish sculptor: b. Brussels 1594; d. Leghorn, Italy, 12 July 1646. He was taught by his father and became celebrated at an early age. His best works are child figures. The Baldachino in the Vatican contains examples of his art.

Dura Mater, dü'ra mät'ér, the outer envelope or covering of the brain. See BRAIN.

Duram, or Durão, Jozé de Santa Rita, hō-sá' dā sän'tā rē'tā doo-rän', Brazilian poet: b. near Mariana, province of Minas Geraes, 1737; d. Lisbon, Portugal, 1783. He qualified himself for the service of the Church by his studies at Rio Janeiro and at Coimbra in Portugal, was graduated doctor of divinity at the university of the latter city, and joined the religious order of St. Augustine. In the course of his travels in Spain and Italy he became acquainted with Alfieri and other eminent men of letters, and subsequently during his residence at Coimbra composed a poem founded upon the story of the Galician adventurer, Diego Alvarez Correa, surnamed Caramuru, the legendary hero of Bahia. This poem was published at Lisbon in 1781, under the title of 'Caramuru, poema epico do descobrimento da Bahia,' and a French version appeared at Paris in 1829. On its first appearance the poem was not highly estimated, but since then has risen to the rank of a national epic in Brazil.

Duramen, dü-rā'mén (a Latin word for hardness), the heart-wood, or central wood in the trunk of exogenous trees as found in *dicotyledons* and *conifers*. (See CONIFERA.) It is hard and dense, and often dark-colored, with its tubes dry and thick. Thus in the ebony the duramen is black, and is the part used for furniture and fine cabinet-making. The albumum (q.v.), or outer wood, is pale. In the beech the heart-wood is light brown; in the oak deep brown; in the Judas-tree yellow, and in guaiacum greenish. The relative proportion of duramen and albumum differs in different trees. By ship-carpenters the duramen is known as the "spine."

Duran, doo-rän', Augustin, Spanish scholar: b. Madrid 14 Oct. 1789; d. there 1 Dec. 1862. He paid much attention to the study of foreign, especially to French literature, and edited a very important collection of Moorish, miscellaneous, and historical ballads, and ballads

DURAN — DURANDUS

of chivalry (1828-32), a new edition forming part of the extensive 'Biblioteca de autores Españoles' (Madrid 1849-51). He also wrote a history of the Spanish drama from its origin to the middle of the 18th century.

Duran, Carolus, kä-rō-lūs' dü-rän (CHARLES AUGUSTE EMILE DURAND), French painter: b. Lille, 4 July 1837. He received his early art education at the municipal school in his native town, and in 1853 went to Paris and spent much time in copying again and again 'La Joconde,' at the Louvre. He gained the Wicar traveling scholarship, and went to Italy, and at Rome painted 'La Prière du Soir,' exhibited at the Salon in 1865. For 'L'Assassiné' (1866) he was awarded his first medal. This picture and a portrait of M. Ed. Reynart was purchased by the government for the museum at Lille. Duran resided for a year in Spain, and the influence of Velasquez is clearly seen in his 'St. Francis of Assisi,' exhibited at the Paris Salon in 1868. But his fame rests principally on his portraits, which are very numerous, and executed with a power and dash which are undeniable, whatever we may think of their refinement or grace. Among them may be mentioned Emile de Girardin, those of his daughters, the equestrian portrait of Mlle. Croizette, the well-known actress, and a portrait of Pasteur. He is a Chevalier of the Legion of Honor, and of the Order of Leopold. In 1898 he made a lecturing tour to the United States, this being his second visit. In the same year he was elected president of the National Society of Fine Arts.

Durance, dü-räns, a river in France, which rises in Mount Genève, on the west slope of the Cottian Alps; flows in a general direction south, and, after a course of 180 miles, empties into the Rhone, 4 miles below Avignon. The stream is so full of debris that it is not navigable. It often commits great ravages by inundation.

Durand, dü-rän, Alice Mary Céleste Fleury ("HENRY GRÉVILLE"), French novelist: b. Paris 12 Oct. 1842; d. there 26 May 1902. In early life she went to St. Petersburg with her father, Professor Fleury. She there married M. Durand, a French law professor, returning to France in 1872. She visited the United States in 1886 and several of her novels re-published in America, had a wide circulation here. Her published works, appearing under the pseudonym, 'HENRY GRÉVILLE,' include: 'A Travers Champs' (1812); 'Dosia' (1876); 'L'Expiation de Savelli' (1876); 'La Princesse Oghéroff' (1876); 'Les Koumiassine' (1877); 'Suzanne Normis' (1877); 'Sonia' (1877); 'La Maison Maurège' (1877); 'Les Epreuves de Raissa' (1877); 'L'Amie' (1878); 'Un violon russe' (1879); 'Lucie Rodey' (1879); 'Le Moulin Frappier' (1880); 'La cité Ménard' (1880); 'Madame de Dreux' (1881); 'Rose Rozier' (1882); 'Manuel d'Instruction Civique et Morale des Jeunes Filles' (1882); 'Un Crime' (1884); 'Idylles' (1885); 'Cléopâtre' (1886); 'Frankley' (1880); 'L'avenir d'Aline' (1889); 'Chant de Noces' (1889); 'Le Passe' (1890); 'Un Mystère' (1890); 'Aurette' (1891); 'Pénil' (1891); 'L'Héritière' (1891); 'Un vieux ménage' (1893); 'Fidelka' (1894); etc.

Durand, dü-ränd, Asher Brown, American painter and engraver: b. South Orange, N. J., 21 Aug. 1796; d. there 17 Sept. 1886. For a long time his employment consisted in copying prints

from English books, and working on plates for bank-notes. His engraving of Trumbull's 'Declaration of Independence' brought him into general notice, and thenceforth for many years his graver was in constant demand for portraits of various dimensions, and figure pieces. He had always, however, entertained the idea of ultimately becoming a painter, and in 1835, having for the previous 10 years been a regular contributor of portraits, small figure pieces, or landscapes in oil, to the exhibitions of the National Academy of Design, finally abandoned engraving as a profession. He devoted himself thereafter mainly to landscape painting, in which department of art he became eminent. The Corcoran Art Gallery, at Washington, contains his 'Mountain Forest' (1869).

Durand, William Frederick, American engineer: b. Bethany, Conn., 5 March 1859. He was graduated at Annapolis, 1880; served in the United States Naval Engineer Corps (1880-7); was professor of mechanical engineering in the Michigan Agricultural and Mechanical College (1887-91), when he became associate professor of marine engineering at Cornell, and full professor in 1895. He has also been principal of the Graduate School of Marine Engineering and Naval Architecture since 1891. He has published 'Resistance and Propulsion of Ships' (1898); 'Practical Marine Engineering' (1902); and many special articles in engineering journals.

Durand, Wis., city, county-seat of Pepin County; on the Chippewa River, about 20 miles from its junction with the Mississippi, and on the Chicago, M. & St. P. R.R. It is the centre of an agricultural region, and its trade and industries are those that pertain to agriculture and stock-raising. Pop. (1900) 1,458.

Durando, doo-rän'dō, Giacomo, Italian general: b. Mondovi, Italy, 1807; d. Rome 26 Aug. 1894. He was minister of war at Turin 1854-5; became a senator in 1860; was minister of foreign affairs in the cabinet of Ratazzi 1862-3, and president of the senate 1884-7. He published in 1847 a brochure in favor of Italian unity under a constitutional government.

Durandus, dü-rän'dus, Gulielmus, French prelate and jurist: b. Puimisson, Languedoc 1237; d. Rome 1 Nov. 1296. He became professor of the canon law in the University of Modena, and there acquired so high a reputation for his learning that Pope Clement IV. made him auditor of the Sacred Palace, and took him as his secretary to the General Council of Lyons (1274). He continued to hold high office in the Curia under successive popes till 1277, when he was appointed lieutenant-governor, both in temporal and spiritual affairs, of the patrimony of St. Peter, under Nicholas III.; the following year he successfully asserted the sovereignty of the Pope over the provinces of Bologna and Romagna. These two provinces he then governed from 1283 to 1286, in the meantime carrying on a war against the people of Romagna, who were in revolt. He was appointed bishop of Meude in Languedoc in the latter year, and retired from the governorship. In 1295 he was again in public station, governor of Romagna, and the March of Ancona; but his strength was unequal to the task of resisting the attacks of the Ghibelline faction, and he resigned his office. His greatest work, 'Speculum Juris' (mirror of the law),

DURANGO — DURAZNO

called by himself 'Speculum Judiciale,' was for a long time a work of highest authority in the practice of both departments of the law; between the years 1474 and 1678 it had 38 editions. He wrote an informal history (commentarius) of the General Council of Lyons, the decrees of which were drawn up by him. Many other works he wrote, which have not been printed.

Durango, dù-răn'gō, Colo., town, county-seat of La Plata County; on the Las Animas River, the Denver & R. G., and the Rio Grande S. railroads; about 20 miles north of the boundary line between Colorado and New Mexico. The smelting and reduction works are the chief manufactures of the town. It has also flour-mills and foundries, and it is the trade centre for the agricultural, stock-raising, and mining products of the southwestern part of Colorado. Pop. 3,500.

Durango, doo-răn'gō, Mexico, a state bounded by Chihuahua on the north, Coahuila on the east and southeast, Zacatecas and Tepic on the south, and Sinaloa on the west. It is one of the largest and richest states in the republic. The Sierra Madre range (altitude 8,125 feet to 11,375 feet) traverses the western and southern portions. Less important ranges are the Copolquina, Topia, Cavelas, Amacuti, Tominil, Muinora, Guanacoi, and San Juan de Camarones; these, as well as the isolated peaks, Cerro del Mercado, Pánuco de Avino, etc., are ore-bearing. The Cerro del Fraile is an extinct volcano. Among the rivers, the Nazas, in the northern part of the state, with its affluents, the Santiago and San Juan; the Tunal, which rises west of the city of Durango, and its affluent, the Suchil; the Rio Chico, or Alaponeta, and the Aguanaval, may be mentioned. There are small lakes, mineral springs, etc. Gold, copper, and silver are the chief mineral products, and the best mining districts are in the partidos of San Dimas, Tamazula, Papasquiaro, San Juan del Rio, Durango, and Nombre de Dios. On 31 Dec. 1897 there were, according to Mexican official figures, 1,331 mining claims registered in Durango. The Cerro del Mercado, near Durango city, is said to contain an immense deposit of iron. Sulphur and rubies are also found. The climate varies with the altitude of the different localities, being cool or cold in the mountainous western regions, and temperate, or warm, in the valleys extending from the base of the mountains and in the Nazas basin. The pasture lands are extremely hot in summer and cold in winter. There is a moderate rainfall, and frosts occur frequently in the uplands. The best agricultural regions are in the partidos of Mapimi, Durango, San Juan del Rio, and Papasquiaro; the agricultural products being corn, barley, wheat, cotton, tobacco, fruits, and sugarcane. The value of the barley produced in a year (Mexican official statistics for 1897) is \$19,310; cotton \$5,403,373; wheat \$602,320; sugarcane products \$11,908, etc. Stock-raising sections are the partidos of El Oro, Cuencame, Durango, Mazas, Indé, and Papasquiaro. Commercial centres are the partidos of Durango and Mapimi an active trade being maintained with the neighboring Mexican states, the United States, and Mexico city. Gold, silver, and iron ores, cereals, cotton, cotton and woolen goods, woods, fruits, live-stock, hides, etc., are exported. The principal imports are groceries, hardware, silk, cotton, linen goods, machinery, agricultural

implements, mining tools, arms and ammunition. The trade of the state has an estimated annual value of \$10,000,000. Manufactured products are: Leather, flour, ixtle carpets, rope, pottery, soap and candles, cotton goods, etc. The railroads are the Mexican International, and the Central. The cities of Durango and Villa Lerdo have street-car systems. There are 186 miles of telegraph, and 310 miles of telephone wires, and an efficient mail service. The state is divided into 13 partidos—Tamazula, pop. 24,305; Papasquiaro, 32,410; Indé, 13,532; Mapimi, 42,548; chief town, Villa Lerdo, with steam flour-mills, a foundry, and other industrial establishments; Cuencame, 22,940; San Juan de Guadalupe, 10,605; Nombre de Dios, 23,090; Mezquital, 6,930; Durango, 60,427, chief town (also capital of the state) Durango (q.v.); San Dimas, 6,480; El Oro, 15,899; Nazas, 19,395; and San Juan del Rio, 25,573. Pop. of the state 295,105.

Durango Guadiana, or **Ciudad de Victoria**, Mexico, capital of the state of the same name, 569 miles from Mexico city. It has many fine buildings, notably the cathedral, government palace, city hall, the theatre, and the mint. There are cotton- and woolen-mills, foundries, flour- and sugar-mills, two banks, a street-car system, and a railroad to Ciudad Porfirio Diaz. Pop. 26,425.

Durant, Henry Fowle, American philanthropist: b. Hanover, N. H., 20 Feb. 1822; d. Wellesley, Mass., 3 Oct. 1881. He was graduated from Harvard in 1842 and became a lawyer, changing his name from Henry Welles Smith to H. T. Durant. He practised with great success at the bar, but on the death of his only son abandoned his profession and devoted his energies to philanthropy. He founded Wellesley College (q.v.), opened in 1875, and was successful as a lay preacher.

Durante, Francesco, frăn-chés'ko doo-răn'té, Italian musician: b. Naples 15 March 1684; d. there 13 Aug. 1755. He is deemed one of the founders of the "Neapolitan school" of composition, and is especially celebrated as a teacher.

Duras, Claire Lechat de Kersaint, klăr-lê-shâ dè ker-sân dü-râ, DUCHESS OF, French novelist: b. Brest 1777; d. Paris 1828. She wrote 'Ourika' (1823), and 'Edward' (1825).

Durazno, doo-räs'nō, Uruguay, a department bounded on the north by Tacuarembó, southeast by Cerro Largo and Treinta y Tres, on the south by Florida and Flores, and on the west by Flores and Rio Negro. It is the most central of the departments, and in size the third. Area, 5,527 square miles. A range of hills divides it into two sections or basins, of which one extends northward to the Rio Negro, and the other southward to the Yi River, the department lying between these two rivers. Numerous streams, rising in the central chain of hills, flow toward the south or north; the entire surface is, therefore, well watered, and furnishes grazing for a large number of cattle, sheep, horses, and mules. Pop. about 25,000.

Durazno, Uruguay, capital of the department of Durazno. It is situated near the Yi River, and is one of the principal stations on the Central Uruguay Railroad. As an active centre for the trading of the neighborhood, it has substantial buildings, a church, hotels, and shops. Pop. 2,000.

DURAZZO — DÜRER

Durazzo, doo-rät'sō (ancient DYRRHACHIUM or EPIDAMNUS), Turkey, a seaport, in the province of Albania, on the Adriatic, 50 miles south by west of Scutari. It was originally founded by a colony of Greeks from Corcyra, and was long the most important maritime town of Illyria. A few columns and marbles are now almost the only remains of the ancient city; the modern town is a poor place of about 1,200 inhabitants.

Durban, dër'bän, Natal, town, the only seaport of Natal; situated on the northern shore of the land-locked inlet known as Port Natal. It is well laid out and solidly built, and has a number of fine buildings. There are railroad connections with the capital and other places. On the "Bluff" at the entrance to the port a battery of heavy guns has been placed. Durban was founded in 1834, and named after Sir Benjamin D'Urban, for some time governor of Cape Colony. Pop. 25,512.

Durbar, dër'bär (Hind. and Pers., *darbar*, door of admittance), in India, Afghanistan, and Persia a state audience at which important public hearings are given, decrees or decisions announced, distinguished foreign visitors received, and treaties, etc., made. These functions are often of great splendor and under British rule there have been several famous durbars in India. The first after the downfall of the Mogul empire and the Mutiny was held 1 Nov. 1858 at Allahabad. Lord Canning then announced the sovereignty of Queen Victoria, and offered amnesty to all but actual murderers of the English. Each viceroy since has held them to impress the Hindus. One of the most magnificent was held by Lord Lytton in 1877, when Queen Victoria took the title of empress of India. The then Prince of Wales had just been visiting India, and been received with enthusiastic demonstrations, and the viceroy summoned the feudatory rulers and their retinues to a great durbar at Delhi, where the proclamation of the new title was made, and festivities, including a grand ball, games, parades, fireworks, convocation of the Indian orders, etc., were held. Another of great splendor was given at the same city on 1 Jan. 1903, to proclaim the accession of Edward VII. The name "durbar" is used also for the audience chamber, as we speak of a church (building).

Durbin, dër'bîn, John Price, American Methodist clergyman and miscellaneous writer: b. Bourbon County, Ky., 1800; d. New York 17 Oct. 1876. He contributed extensively to current literature, and was the author of 'Observations in Europe, Principally in France and Great Britain' (1844); and 'Observations in Egypt, Palestine, Syria, and Asia Minor' (1845).

Düren (ancient MARCODURUM), Germany, town in Rhenish Prussia, on the Roer and the railroad from Aix-la-Chapelle to Cologne, 16 miles east by north of Aix-la-Chapelle. It is of Roman origin, and is mentioned under its ancient name by Tacitus. In 1543 it was destroyed by the Emperor Charles V., at the head of 50,000 men. Diets were held here by Charlemagne (775 and 779). The modern town has some handsome churches, a gymnasium, important manufactures of woollens, paper, leather, and hardware; several large distilleries, and an extensive trade. Pop. (1900) 27,171.

Dürer, Albrecht, äl'brent dü'rër, German painter: b. Nuremberg, Bavaria, 21 May 1471; d. there 1528. His father was a skilful goldsmith of Hungary, and himself instructed his son. Dürer's talent early developed itself, and although he had made great progress in his father's profession by the time he was 15, his inclination took a decided turn for painting. Michael Wohlgemuth, then the best painter in Nuremberg, became his instructor in 1486. Having finished his studies he entered upon his travels, returning home in 1494. Here he executed his masterpiece, a drawing of Orpheus. To please his father he married the daughter of Hans Frey, a celebrated mechanic; but this connection embittered his life, and perhaps brought him to an early grave. In 1505 he went to Venice to accomplish himself in his art. His abilities excited envy and admiration. He painted the 'Martyrdom of Bartholomew' for St. Mark's Church, which painting was purchased by the Emperor Rodolph, and removed to Prague. He also traveled to Bologna, to improve his knowledge of perspective. At his return, in 1507, begins the proper era of his greatness. His fame spread far and wide. Maximilian I. appointed him his court-painter, and Charles V. confirmed him in this office, bestowing upon him at the same time the painter's coat of arms, namely, three escutcheons argent in a deep azure field. Dürer was in favor with high and low. All the artists and learned men of his time honored and loved him, and his early death was greatly lamented. Profound application, great facility in the mechanical part of his art, and a remarkable talent of imitation, were the characteristics of Dürer, and enabled him to exert a great influence on the character of German art. He was the first in Germany who taught the rules of perspective, and of the proportions of the human body, according to mathematical principles. His treatise on proportions was occasioned, it is said, by his studies on the picture of 'Adam and Eve.' He not only made use of the burin, like his predecessors, but was also the inventor of etching, or, if not the inventor, the first who excelled in the art. He invented the method of printing wood-cuts with two colors. His great mathematical knowledge enabled him to form a regular system of rules for drawing and painting. He wrote the first book on fortification, in Germany, and showed how to cast the letters of the alphabet according to fixed proportions, by geometrical calculations. He was particularly eminent as a portrait painter. He had the power of catching the exact expression of the features, and of delineating all the passions. Among his best engravings in copper are his 'Fortune'; 'Melancholy'; 'Adam and Eve in Paradise'; 'St. Hubert'; 'St. Jerome'; and the 'Smaller Passion' (so-called) in 16 plates. Among his best wood-cuts are the 'Greater Passion' (so-called) in 13 plates; the 'Smaller Passion,' with the frontispiece, 37 pieces; the 'Revelation of St. John,' with the frontispiece, 15 plates; the 'Life of Mary,' two prints, with the frontispiece. Bartsch, however, has made it more than probable that Dürer himself did not engrave in wood. He only made the drawings on wooden tablets, which were then cut by form-cutters, of whom there were many skilful ones at that time. Dürer has also much merit as a writer. His writings, which were afterward translated into Latin, French,

etc., were published in a collected form at Arnheim (1603). See Scott, 'Albert Dürer, His Life and Works' (1869); Heaton, 'History of the Life of Albert Dürer' (1869); Thausing, 'Dürer, Geschichte seines Lebens und seiner Kunst'; Colvin, 'Albrecht Dürer, His Teachers, His Rivals, and His Scholars' (1877); Ephrussi, 'Albrecht Dürer et son dessein' (1882); Springer, 'Albrecht Dürer' (1892); Cust, 'Albrecht Dürer' (1897).

Duress, dü'rēs or dü-rēs' (Ital. *duressa*, Lat. *duritia*, deriv. of *durus*, hard), restraint of liberty, or restraint of the person or goods. (1) Of the person. This is exercised either by incarceration or by threats or menaces, *duress per minas*; in either case the overt act must consist in compelling a person to do some act, as to execute a deed or commit an offense; in such cases the act is invalid and excusable. In a broader sense, duress is charged by the law when a person in extreme poverty or distress is induced to seek alleviation by assuming an obligation. Yet the deed signed, or the contract made under duress is not void, though voidable at the will of the party compelled to execute or assume it. (2) Duress of goods refers to the case of one who is compelled to pay money for the release of goods unlawfully detained. Duress may be charged to the collector of a port who charges unauthorized duties.

Duret, Francisque, frän-sësk dü-rä, French sculptor: b. Paris 19 Oct. 1804; d. there 25 May 1865. He studied sculpture in Paris with intense ardor; in 1823 he won the Roman prize, and gained a gold medal in 1831 by his 'Mercury, Inventor of the Lyre,' which recalled somewhat the refined modernity of Canova. Indeed, Canova seems to have been rather the source of inspiration to him than the models of the antique. In 1833 he produced 'The Neapolitan Fisherman Dancing the Tarantula,' a work of life-like realism, of perfect elegance and the most refined modeling, which is his masterpiece, and stands in the Louvre. In the same gallery is his 'Improvisator Singing a Love-Song' (1836), a replica of which is in the city museum of Leipzig. For the museum at Versailles he executed statues of Molière, Dunois, and Richelieu; for the Madeleine figures of Christ and St. Gabriel. The gallery of seven chimneys in the Louvre is adorned by his 'Victory,' and for the foyer of the Théâtre Française he executed statues of 'Tragedy' and 'Comedy' and a figure of Rachel, the actress. In 1860 he completed the monumental fountain on the Place de St. Michel, in Paris. It is surmounted by a figure of 'St. Michael the Dragon-Slayer.' As professor in the École des Beaux Arts, his energies were concentrated on the task of teaching and he produced few original works; those which he has left are good examples of modern French sculpture with its ease, its demonstrative fluidity and dramatic point, which take the place of the serenity and severe but flawless grace of the Greek masters.

Durfee, dér'fē, Job, American jurist: b. Tiverton, R. I., 20 Sept. 1790; d. there 26 July 1847. He was graduated at Brown University in 1813; was elected to Congress in 1820, and became chief justice of Rhode Island in 1835. Among his various writings is 'What Cheer,' a poem on the adventures of Roger Williams.

Durfee, Thomas, American jurist: b. Tiverton, R. I., 6 Feb. 1826; d. Providence, R. I., 6 June 1901. He was graduated at Brown University 1846; was admitted to the bar 1848; reporter of the Rhode Island supreme court 1849-53; presiding judge of the court of magistrates 1855-60; speaker of the Rhode Island house of representatives 1863-5; associate justice of the Rhode Island supreme court 1865-75; and chief justice 1875-91, when he retired. He was elected a trustee of Brown University 1875, and its chancellor 1879-88. He published: 'Reports of Cases in the Supreme Court of Rhode Island' (1851-3); 'Treatise on the Law of Highways' (1857), begun by J. K. Angell; 'The Village Picnic, and Other Poems' (1872); 'Gleanings from the Judicial History of Rhode Island' (1883); 'Some Thoughts on the Constitution of Rhode Island' (1884); and several orations on public occasions.

Durfee, William Franklin, American engineer: b. New Bedford, Mass., 15 Nov. 1833; d. Middletown, N. Y., 14 Nov. 1899. He studied at Lawrence Scientific School, Harvard, and turned his attention to steel manufacture, his establishment turning out in 1865 the ingots from which were made the first steel rails in the United States. After 1875 he practised as a consulting engineer and patent expert.

D'Urfev, dér'fi, Thomas, commonly known as 'Tom D'URFEY,' English dramatist and poet: b. Exeter, 1653; d. London 26 Feb. 1723. He was a good-natured, simple-hearted, thoroughly vulgar and unliterary writer. His dramas, comedies, operas, tragedies, and songs are like what Sancho Panza would have written if he had taken to letters. Many, like 'The Siege of Memphis' (1676), a tragedy, and 'The Plotting Sisters' (1691), a comedy, are verbose; others, like the 'Songs Complete' (1699), are of virginal simplicity, but not of virginal modesty.

Durga, door'gā, or Parvati (Sanskrit, 'The Inaccessible One'), a Hindu divinity, one of the names given to the consort of Siva. She is generally represented with 10 arms. In one hand she holds a spear, with which she is piercing Mahisha, the chief of the demons, the killing of whom was her most famous exploit; in another a sword; in a third the hair of the demon chief; and in others, the trident, discus, axe, club, and shield. A great festival in her honor, the *Durgapuja*, is celebrated annually in Bengal with wild orgies about the beginning of October, and lasts for about 10 days in all. See SIVA, DEVI.

Durgah, The, a famous tomb built for the Sheikh Selim-Chisti, at Futehpore, near Agra, in Hindustan. It was erected at a cost of 37 lacs of rupees, or \$1,750,000. The tomb as well as a canopy, six feet high, which covers it, is made of mother-of-pearl. The floor is of jasper and the walls of white marble inlaid with cornelian. The screens of marble surrounding the building are the most beautiful in India. They are single, thin slabs about eight feet square and wrought into such intricate open patterns that they appear as having been woven in a loom.

Durham, dür'am, John George Lambton, EARL OF, English statesman: b. London 12 April 1792; d. Cowes, Isle of Wight, 28 July 1840. He took an active part in furthering all projects of a reforming tendency, even bringing

DURHAM — DURLACH

forward in 1821 a scheme for parliamentary reform much more advanced than that of 1832. In 1828 he was raised to the peerage, with the title of Baron Durham. Under the administration of Lord Grey (1830) he held the office of Lord Privy Seal, and was one of the four persons who drew up the Reform Bill, and supported it in the House of Lords. For a time he was ambassador at St. Petersburg. In 1838 he was appointed governor-general of Canada, where owing to the revolt of the French in Lower Canada, the constitution had been suspended. Lord Durham's measures were statesmanlike, but dictatorial; and the House of Lords voted disapproval of some of his acts. Thereupon he took the extraordinary step of returning to England without either being recalled or obtaining the royal consent. Lord Durham's famous report on Canada anticipated many of the best features in the present Canadian constitution.

Durham, one of the three English counties called counties palatine (see COUNTY PALATINE). There is more coal mined in Durham than in any other county of England; and lead and iron mines are worked. Some of its manufactures are iron works, potteries, linen- and woolen-mills, glass and chemical works. Pop. (1901) 1,187,324.

Durham (ancient DUNHOLME), England, city and parliamentary borough, capital of the county of the same name, on the River Wear; 14 miles south of Newcastle. The principal public buildings are the ancient castle (now appropriated to the uses of the university), the cathedral, and other churches, the town hall, county prison, and the grammar school. The educational institutions comprise the university, the grammar school, training school for school-mistresses, and other schools. There are manufactures of carpeting and mustard. The cathedral is believed to have been founded by William de Carlepho, assisted by Malcolm, king of Scotland, in 1093. Pop. 14,935.

Durham, N. C., city in Durham County, on the Southern Air Line and the Southern railroads; 26 miles northwest of Raleigh. It is a tobacco and cotton-growing centre, and the seat of Trinity College (Methodist Episcopal South). The manufacture of a famous brand of smoking tobacco is the staple industry of the place. It was the scene of the treaty between Gens. Sherman and Johnston at the close of the Civil War. It has a national bank, newspapers, and good schools. Pop. 6,679.

Durham Book, The, or St. Cuthbert's Book, a manuscript of the Latin text of the gospels, with an interlinear gloss in Saxon. The book dates from the last of the 7th century, and is supposed by some to have been written by Eadfrith, of Lindisfarne. It is one of the most beautiful of the manuscripts made by the old monks, and is one of the most highly prized treasures of the British Museum.

Durham Cattle. See CATTLE.

Durham, University of, located at Durham and which was originated in 1831 under Bishop Van Mildert, by the appropriation of part of the property belonging to the cathedral chapter. In 1832 an act of Parliament was obtained sanctioning the erection of the proposed university; in 1833 the university was opened, and in 1837

it was incorporated by royal charter. In 1841 the office of warden was permanently annexed to the deanery of Durham, a canonry in the cathedral was annexed to each of the professors of divinity and Greek; a professor of mathematics and astronomy appointed, and 18 fellowships were founded, besides 6 which had previously been founded by the dean and chapter. As at Oxford and Cambridge, the students reside mostly within the university buildings, accommodation being provided for them in University College, and in Bishop Hatfield's Hall. The university awards the degrees of Bachelor and Master of Arts, Bachelor and Doctor of Literature, of Science, and of Divinity; the usual medical degrees, degrees in music, and the degree of Doctor of Civil Law. The academical year is divided into three terms — Michaelmas, Epiphany, and Easter. No religious test is required from any member of the university unless he is a student in the faculty of theology. Science was taught from the first, but not to a satisfactory extent till 1871, when the Durham College of Science was instituted in connection with the university at Newcastle-upon-Tyne. The medical department of the university is constituted by the Durham University College of Medicine, founded in 1851 at Newcastle, an institution which has greatly increased in efficiency in recent years by the establishment of additional chairs. Since 1895 all degrees except those in divinity may be granted to women.

Durian, dū'ri-an, or **Durion** (*Durio zibethinus*), a fruit-tree of the natural order *Malvaceæ*, generally diffused over the southeast of Asia, especially in the Malay peninsula and neighboring islands. It is esteemed for the flavor of its fruit which, however, is an acquired taste, the fruit having a strong, musk-like odor, and a somewhat terebinthine flavor. The tree, which on an average yields 200 fruits annually, is about the size and the form of a pear-tree, but with cherry-shaped leaves, except that they are entire and smooth at the edges. The flowers are large and of a yellowish-white. The fruit, of globular or oval form, from eight to ten inches long, large in some species as a man's head, is not unlike the bread-fruit externally. It has a hard, prickly rind, covered with warts and tubercles. When ripe it becomes of a brownish-yellow, and opens at the top; it must be eaten almost fresh from the tree, as it putrefies in less than 24 hours. The fruit contains five large longitudinal cells, each containing one to four seeds about the size of pigeon's eggs, embedded in a custard-like pulp, which is the delicious part of the fruit. The seeds are roasted and eaten like chestnuts, ground into flour, and also made into vegetable ivory. The pharmaceutical qualities of the fruit are aphrodisiacal.

Dürkheim, dürk'him, or **Dürkheim an der Hardt**, Bavaria, town in the Palatinate. 14 miles southwest of Mannheim. Its annual sausage market, founded in 1494, is attended by large numbers of people. Dürkheim has saline springs, in the water of which Bunsen and Kirchhoff, by spectrum analysis, first detected the metals rubidium and cesium in 1860. Dürkheim was walled and fortified, so was an object of keen contest during the Thirty Years' War. Pop. 6,055.

Durlach, door'län, Germany, town in the Grand Duchy of Baden, four miles southeast

of Carlsruhe, at the foot of the Turmberg. It is of Roman origin. It has manufactures of iron, machinery, organs, sewing-machines, gloves and beer, and is celebrated for its fruit. Pop. 11,425.

Durmast, dër'mast, a species of oak, *Quercus sessiliflora*, or according to some *Q. pubescens*, a variety of the common oak (*Q. robur*). Its wood is, however, darker, heavier, less easy to split, not so easy to break, yet the least difficult to bend. It is highly valued, therefore, by the builder and cabinet-maker.

Duroc, Michel Gérard Christophe, mē-shēl zhā-rār krēs-tōf dü-rōk, Duke of Friuli, French soldier: b. Pont-à-Mousson, 25 Oct. 1772; d. Bautzen 22 May 1813. He served as aide-de-camp to Napoleon in the Italian and Egyptian campaigns. In 1805 he was made grand marshal of the palace, and was frequently employed in diplomatic missions, though he still took his full share in the wars of France till the time of his death. He was a great favorite of Napoleon, and was killed by his side at the battle of Bautzen.

Durra, dūr-ā, a genus of grasses of great economical importance throughout Africa and Asia, especially in India, also called Indian millet, Guinea corn, or Sorgho grass. See SORGHUM.

Dürrenstein, dūr'rēn-stēn, Austria, village on the Danube; 41 miles northwest of Vienna. It is celebrated for its feudal castle, in which Richard Cœur-de-Lion was treacherously detained on his return from Palestine (1192) by Duke Leopold of Austria. It was destroyed by the Swedes in 1645. In November, 1805, the French here defeated the Austrians and Russians.

Durugmunan, doo-roog-moo'nān, a race possessing Mongolian characteristics and dwelling in the interior of the island of Mindoro.

Duruy, Georges, zhōrzh dü-rü-ē, French writer on history: b. Paris 1853. He became professor of French literature in the Polytechnic School in 1891. He wrote some novels that became popular favorites, as 'The Life-guard'; 'A Soul's Victory'; 'Dream-End.' His principal historical works are: 'History of Turenne'; 'Short Popular History of France.' His 'Cardinal Carlo Carafa: a Study on the Pontificate of Paul IV.' (1883) was crowned by the Academy.

Duruy, Victor, vĕk-tōr, French historian and statesman: b. Paris 11 Sept. 1811; d. there 25 Nov. 1894. He was professor of history in the Collège (afterward Lycée) Henry IV. prior to 1861. In 1862 he was appointed inspector-general of public instruction and professor at the École Polytechnique, and in the following year Napoleon III. made him minister of public instruction. During his six years' tenure of this office he carried out many important reforms in spite of the determined opposition of the clerical party, and on resigning his office in 1869 he was nominated a member of the senate. He was elected a member of the Academy of Inscriptions in 1873, and in 1884 a member of the French Academy. Besides many excellent school manuals, he wrote: 'Histoire des Romains depuis les Temps les plus Reculés jusqu'à L'Invasion des Barbares' (1870-9), his most important work; 'Histoire des Grecs depuis les

Temps les plus Reculés jusqu'à la Réduction de la Grèce en Province Romaine' (1862), crowned by the Academy; 'Histoire de France' (1852); 'Introduction Générale à l'Histoire de France' (1865); and other works. He was general editor of Hachette's great 'Histoire Universelle.'

Durward, Quentin. See QUENTIN DURWARD.

Duryée, dūr-yā, Abram, American soldier: b. New York 1815; d. there 1890. He was educated in the common schools, and going into business made his fortune in mahogany furniture. He entered the State militia in 1833, was made colonel of the 27th Regiment in 1849 and was conspicuous as a maintainer of order during the riots that prevailed up to 1861. During the Civil War he raised the regiment known as 'Duryée's Zouaves,' and was promoted to be brigadier-general of volunteers in August 1861, but resigned in January 1863 owing to a disagreement over a question of rank. His gallant services at the battles of Cedar Mountain, Rappahannock Station, Thoroughfare Gap, Groveton, Chantilly, South Mountain, and Antietam gained for him the brevet rank of major-general in 1865. In 1874, as police commissioner of New York, he attacked and dispersed a body of communists seditiously gathered together in Tompkins Square.

Duse, doo'sā, Eleanora, Italian actress: b. Vigevano, Italy, 3 Oct. 1859. Her childhood and early youth were filled with sorrow, arising from poverty, hardships, the loss of friends and an unworthily bestowed affection. Hers was a lineage of actors, and her early environment destined her for the stage. Her grandfather founded the Garibaldi Theatre in Padua. She was dragged about the minor theatres of Italy in her father's companies, playing Cosette in 'Les Misérables' at 7, and star of the little troop at 13 in 'Francesca da Rimini.' When she was 14 she played Juliet at Verona, in an open-air theatre, her performance compelling recognition as most extraordinarily brilliant. Still she had to wait for general recognition until 1879, when she played Zola's 'Thérèse Raquin' in Naples in 1887. She appeared in Venice in 1892, and later in all the chief European cities, making her debut at the Fifth Avenue Theatre in New York as Camille in Dumas' play of that name, January 1893. Among the roles which she has triumphantly essayed are Marguerite, Magda, Paula, La Femme de Claude, La Locandiera. She was married to an Italian actor-journalist, Signor Checchi, before she was 20, but they soon separated. Duse has remarkable emotional power and the ability to represent suffering and to make the most of tragic situations, at the same time possessing such versatility that she can play parts of opposite character the same evening. She pays little attention to the meretricious accessories of the stage makeup. Great simplicity and naturalness, coupled with striking intensity, characterize her acting. She has great excellence in diction and in facial expression, the latter being continuous and minute. Her repertory is enormous, her art including the plays of Dumas, Scribe, Verga, Prega, Ibsen, Sudermann, d'Annunzio, and Shakespeare. Her tours in the United States, 1893, 1896, 1902-3, were very successful from the artistic and managerial point of view.

DUSKY DUCK—DUST

Dusky Duck, or Black Duck, a north American duck (*Anas obscura*), closely related to the mallard, but of a prevailing sooty hue in its plumage. It is peculiar in being confined to the eastern half of North America, breeding abundantly in Labrador, and appearing in the United States in winter, when it becomes one of the principal market ducks. Its nest, eggs, and general habits are like those of the mallard.

Dussaud, dūs-sō, **Frantz**, Swiss physicist and inventor: b. Geneva, Switzerland, 1870. He was appointed professor of physics in the university of his native town in 1892 and superintendent of public instruction in 1895, in which year he was elected deputy to the assembly. Besides his services as a scientific writer, he has invented many ingenious and useful appliances such as the phonograph for the deaf, the cinematograph for the blind, the loud-speaking telephone, the registering telephone, etc.

Dussek, Jan Ladislav, yān lād'is-lā doo'-shĕk, Bohemian composer and pianist: b. Czaslau 9 Feb. 1761; d. St. Germain-en-Laye 29 March 1812. He was trained at Iglau, Kuttenberg, and Prague, and afterward was organist at Mechlin and Bergenop-Zoom. At Amsterdam he met with much success, both as a teacher and performer, and here he produced his earliest works for the pianoforte; he afterward resided at The Hague, and in Hamburg, Lithuania, Paris, Milan, and London (1788-1800), where he was very popular. In 1803-6 he lived as instructor and boon companion with Prince Louis Ferdinand of Prussia, whose death called forth the beautiful and pathetic 'Elégie Harmonique' (op. 61); in 1807 he entered the service of Prince Talleyrand, and thenceforward devoted most of his time to composition.

Düsseldorf, dūs'sĕl-dōrf, Germany, city, the capital of the government of the same name, in the Rhenish province; on the Rhine, here crossed by a bridge of boats, and on the railroad from Elberfeld, 22 miles northwest of Cologne. It consists of the old town in the north, Karlstadt, the new town, and Friedrichstadt in the south, with the suburbs of Derendorf, Flingern, Oberbilk, Unterbilk, and other small places. The chief public squares are the Corneliusplatz, with a fountain and a statue of Cornelius; Schadowplatz, with a monument of Schadow; the market-place with an equestrian statue of the Elector Johann Wilhelm; and the Burgplatz, with the tower of the castle which was founded in 1710 and burned down in 1872. In 1896 a bronze equestrian statue of the Emperor William I. was unveiled. The principal churches, of which there are 12 Roman Catholic and 3 Protestant, are St. Lambert's, a 14th century building, near the Rhine, adorned with marble monuments of Wilhelm IV. and Johann Wilhelm, the last two Dukes of Cleves and Berg; and St. Andrew's, completed 1629. Other buildings are the Academy, a modern building in the Renaissance style; the court-house, with Schadow's last oil-paintings; and a building of the 16th century, with fine paintings. The Academy of Art was founded 1767, by the Elector Theodore, remodelled in 1821, and afterwards directed by Cornelius and Schadow. This city has the honor of having founded a school of painting, which takes the name of Düsseldorf. In the Art Hall, opened in 1881, are several modern pictures; and there are some paintings by the

old masters, besides drawings, engravings, and water-colors, in the old palace. The Hofgarten is a magnificent public garden extending eastward from the Rhine; and there are also a zoological garden and a Floragarten. Düsseldorf carries on considerable manufacturing, and its trade as a port and railroad centre is large and increasing. After being the capital of the duchy of Juliers and Berg, Düsseldorf passed under the rules of the counts palatine of Neuberg, and then became the residence of the Elector-palatine John William, under whom it enjoyed great prosperity and became a centre of artistic work. It was taken by the French in 1795, restored to Bavaria by the Treaty of Luneville in 1801; in 1806 became the capital of the grand-duchy of Berg, with which it passed to Prussia in 1814. Pop. (1900) 213,767.

Dust, the fine particles of matter which float on currents of air, or settle on surrounding objects. Country air may contain only 200 particles of dust per cubic centimetre, while that of large cities may run up to 150,000, and in tenement houses as high as 1,000,000. These particles consist of sand, soot, cotton fibre, pollen, fine hair, pulverized excreta of animals, parts of seeds, bacteria, molds, etc. This is the ordinary condition of things. Frequently, as was the case after the Krakatoa eruption in 1883, the atmosphere becomes widely and densely charged with volcanic particles of varied minuteness, the smallest and lightest of which must take months, even years in settling. Remarkable color effects were produced in the heavens by the refraction of the sun's rays through these dust clouds. Aitken, a Scotch savant, has shown that no condensation of moisture (as in rain, mist, fog; see Fog) could occur without nuclei such as dust particles. He has also devised an apparatus for counting the number of dust particles in a given sample of air or gas. But one of the most important and serious questions concerning dust-laden air is the danger it brings to human life, as disseminating the bacteria of disease. Nearly one fourth of all deaths are due to consumption. Now the expectoration of a consumptive may contain millions of germs. Falling on the sidewalk or carriage-way of a city, it is soon tracked over a large area and gradually mixed with the dust; especially on asphalt pavements, where each wheel acts as a millstone, grinding everything into the finest powder, to be raised by passing vehicles into the air and sent into thousands of healthy lungs. The number of disease bacteria in the air has been calculated by many analyses. Taking 10 liters of air for a basis: in the Boston City Hospital the number of living bacteria was found to be nearly 450, and of molds 225. In a model New York hospital, where everything is supposed to be clean, 12 living germs settled on the disk, and, after sweeping, 226. In a New York tenement house carpeted living room, 75 living bacteria settled on the disk in an exposure of five minutes; after sweeping, 2,700, and mold settled on a plate or disk three and three quarters inches in diameter. Precautions have recently been taken against the peril of dust-spreading disease by constantly flushing the streets, and sweeping away all superficial dust into the sewers. The dust of such meteorites as undergo complete combustion on contact with atmospheric air, has been traced on the earth's surface; for example, on

DUST-BRAND — DUTCH EAST INDIES

the inland ice of Greenland in the shape of particles of magnetic iron with cobalt. Dust of the same sort has been found on the snow of various northern regions, and scientific men have given it the name of cosmic dust.

Dust-brand, or **Smut**, a disease of certain plants, as oats, barley, corn, and other cereals. It is caused by a parasite fungi called *Ustilago*, which causes a swelling that at length becomes a powdery sooty mass. The common forms are *Ustilago segetum* and *U. carbo*; that which attacks Indian corn is *Ustilago maydis*.

Dustin, Hannah, American heroine; she was the wife of Thomas Dustin and was captured by the Indians during their attack on Haverhill 16 March 1697. Her youngest child, an infant one week old, was killed, but her husband, with their other seven children was successful in escaping. The mother, with her nurse, Mary Neff, was carried off and put in charge of an Indian family consisting of two men, three women and seven children. The captives on their way to a large Indian village halted at an island six miles above the present Concord, N. H. Here Mrs. Dustin and her nurse, assisted by an English youth, Samuel Leonardson, killed and scalped all the Indians in their sleep, excepting one squaw, and a small boy, and after a difficult journey in which they endured many hardships, reached home in safety.

Dusty-foot. See **PIEPOWDER COURT**.

Dusty-miller, a common name of some of the plants of the genus *Primula* of the primrose family, from the white flour-like appearance of the leaves. The name is also applied to *Cineraria maritima*, a native of the Mediterranean shore, and much grown in greenhouses.

Dutch is the anglicized form of the word *Dietsch*, *Deutsch*, or *Deutsch*, which in the Middle Ages was applied to the Teutonic people who spoke a language other than the Latin or the Romance languages. *Dietsch* means, "belonging to the common people; vernacular." While the term Dutch was once applied by English speaking peoples to Germany and things German it has long been restricted to the language and people of the Netherlands. The people of Holland call themselves *Nederlandsch* and use their forms *Duitsch*, *Nederduitsch*, as the Germans do *Deutsch*, *Niederdeutsch*. For Dutch Language and Literature, see **NETHERLANDS**.

Dutch Church, the church to which the majority of the people of Holland adhere. In the 16th century the Dutch wavered for a time between the Lutheran Church, whose leader was the great reformer, and the Reformed Church, whose leaders were Calvin and Zwingli. In 1571 they publicly professed their allegiance to the latter by embodying its doctrines in the Belgic Confession of Faith, published in that year. As long as they were under the sway of the Spaniards they, however, abstained from the use of the word Reformed, which had been introduced by the French, and styled themselves "Associates of the Augsburg Confession," the Spaniards considering Lutherans more easy to govern than Calvinists. One of the most notable events in the history of the Dutch Church, after the yoke of Spain was broken, was the Synod of Dort, in 1618. James Arminius, professor of theology at Leyden, having rejected the Calvinistic tenets and adopted those which

were destined to be called after himself, Arminian, a synod was convened at Dort to examine and, if need be, condemn his views. This was done, but with little effect, the views of Arminius prevailing to a greater extent after than they had done before their condemnation. The government of the present Dutch Church is Presbyterian. See **LUTHER**; **NETHERLANDS**; **REFORMATION**; **ZWINGLI**.

Dutch Clover, a common name for the white clover (*Trifolium repens*), a valuable pasture plant, very common throughout the United States, probably naturalized from Europe. It is also a native of Siberia, and is found in all temperate regions. It has a creeping stem, the leaflets are broad, with a horse-shoe mark in the centre, and the white or pinkish-white flowers form a roundish head. The plant is so well known that it has a variety of familiar names, the best known English names being sheep's-gowan, honey-stalks, lamb-sucklings, and occasionally shamrock. In America it is called honeysuckle clover. See **CLOVER**.

Dutch Concert, a so-called concert in which every man sings his own song at the same time that his neighbor is also singing his. There is another form of Dutch concert, in which each person present sings in turn one verse of any song he pleases, some well-known chorus being used as a burden after each verse.

Dutch Courage, false or fictitious courage, usually applied to the bravado inspired by partial intoxication. The phrase probably originated in the 17th century, when England's wars with the Dutch, and especially the naval reverses England suffered at their hands in the reign of Charles II., rendered in England the very name "Dutch" a synonym for all that was bad.

Dutch East India Company. See **EAST INDIA COMPANIES**.

Dutch East Indies, the islands in the Malay Archipelago owned by the Dutch; situated between 6° N. and 11° S. latitude, and between 95° and 141° E. longitude. The names, area, and population of the divisions are as follows:

DIVISIONS	Area; English sq. m.	Population in 1900
Java and Madura.....	50,554	28,745,698
Sumatra, West Coast.....	31,649	1,527,297
Sumatra, East Coast.....	35,312	421,088
Island of Sumatra { Benkulen	9,399	158,767
Lampoung	11,284	142,246
Palembang	53,497	692,317
Atjeh	20,471	110,804
Riau-Lingga Archipelago.....	16,301	74,483
Banca	4,446	106,305
Billiton	1,863	43,386
Borneo, West Coast.....	55,825	379,775
Borneo, South and East Dis- tricts	156,912	716,822
Island of Celebes	49,390	1,448,700
Celebes / Menado	22,080	293,947
Molucca Islands.....	43,864	430,855
Timor Archipelago.....	17,698	119,239
Bali and Lombok.....	4,065	431,696
New Guinea to 141° E. lon..	151,789	200,000
Total.....	736,400	36,000,000

The areas given are accurate; but, except for Java and Madura, the population is estimated. The figures, however, are approximately correct, as the official records give the census every

DUTCH GOLD—DUTCH REFORMED CHURCH IN AMERICA

five years. The population of some unexplored sections is not included. The last official returns give the total population, approximately 36,000,000, or about seven times as large as that of Netherlands. The number of Europeans in Dutch East Indies, in 1900, was 75,927; of Chinese, 460,000; of Arabs, 24,000; of people from parts of Asia other than China and Arabia, 27,000; and about all the remainder were natives. The chief occupation of the people is agriculture. The greater part of the land of the island of Java is government property, but in the western part there are a number of private estates. The government or the private owners of estates are entitled by law to one day's gratuitous work each week from each laborer on the estate, or, instead, to the payment of one guilder per head annually. Since the passage of the "agrarian" law in 1870 which granted waste lands on hereditary leases for 75 years, agriculture has increased in Java and the other islands. At first the government raised all the most productive articles as sugar, coffee, rice, etc.; but since 1891 the government has ceased to cultivate sugar, and it is now grown on the lands hired by the natives, or on lands held on emphyteutic tenure from the government. All the usual products are cultivated on private estates. The annual production of sugar has greatly increased from 1896 to 1901; the amount of coffee produced in the same time has decreased; cinchona has increased rapidly; tea, tobacco, and indigo have increased steadily. The yield of the tin mines of Bilton and Riouw, and of the coal mines of Java, Sumatra, and Borneo have increased each year. Buffaloes, oxen, cows, and horses are raised extensively. In India horses are not used for agricultural purposes.

Manufactories are increasing slowly; rice-mills, saw-mills, soap factories, ice and soda water manufactories are in some of the towns. In 1900 there were 3 government and 55 private printing presses. The principal articles of export are sugar, coffee, tea, rice, indigo, cinchona, tobacco, and tin. Nearly all of the exports, except rice, go to the Netherlands. The railroad and the mail and telegraph service is fair and is becoming better each year. The local revenue derived from land, taxes on houses and estates, from licenses, custom duties, personal imposts, some indirect taxes, and from the government monopolies of salt, opium, and railroads, and the sale of government products. About one-third of the annual expenditure is for the army and navy, another third for the general administration, and the balance for the local government administration. The "Java Bank" is controlled by the government. There are two other Dutch banks, several branches of banks in Great Britain, and a number of savings banks. The legal coins and the weights and measures are the same as for Netherlands. The local weights and measures are as follows:

The Amsterdamsch Pound	= 1.09 lb. avoirdupois.
" Pikol	= 133¼ lbs. "
" Catty	= 1½ lb. "
" Tjengkal	= 4 yards.

In the administration of justice the principle observed is that Europeans and those assimilated with them, are subject to laws nearly similar to those in vogue in the Netherlands; and the natives are subject to their own

customs and institutions. The administration of justice for Europeans is in charge of European judges, while that for the natives is almost wholly in charge of native chiefs.

Schools are provided for all Europeans and natives. In 1900, there were five normal schools, four schools for sons of native chiefs, and the government and private elementary schools in Java and Madura numbered about 600, and for the outposts for the same year, 900.

Entire liberty of worship is granted to the members of all religious denominations. Christianity is increasing among the natives. In Java and the outposts, in 1873, there were 154,345 Christians, and in 1896, there were 309,258 Christians.

Dutch Gold. See COPPER

Dutch Guiana. See GUIANA.

Dutch Harbor, Alaska, a port in the north-eastern part of the island of Unalaska, situated on Bering Sea. It is a port of call for steamers passing through the Unimak Pass. See ALASKA.

Dutch Language and Literature. See NETHERLANDS.

Dutch Liquid, an oily liquid, known to the chemist as ethylene dichlorid ($C_2H_2Cl_2$), which is obtained by the action of chlorine gas upon ethylene, and also as a by-product in the manufacture of chloral. It has anæsthetic properties, and is reputed to be quite safe; but it is irritating to the throat, and is therefore not used. The name relates to its early preparation by the Dutch chemists.

Dutch Metal. See COPPER.

Dutch Oven, a spider, skillet, or camp-oven used by those who cook by hot coals on the hearth, a mode yet common in the western States of the Union, and unsurpassed in its results with skillful housewives. The pot stands in hot embers, and more of the same are piled on the dish-shaped lid. The phrase is also applied to a cooking-chamber suspended in front of a fire so as to cook by radiation.

Dutch Pink, a yellow lake, prepared from bark of the quercitron (the dyer's oak), used in distemper, for staining paper-hangings, and for other ordinary purposes.

Dutch Reformed Church in America. The history of the Dutch Reformed, or Reformed Dutch Church, had its beginning in Switzerland in 1516 under the leadership of the heroic and devout Zwingli. Holland early felt the impulse of the Reformed faith as it came to her by way of the Palatinate, and through Swiss and French influences received it modified as to doctrine and polity. That Calvin had much to do in giving shape to the government of the Church in its Swiss home may account for that robustness of character by which in the early days the Reformed faith had so wide and powerful an influence and that heroic endurance to withstand the persecutions which befell it. These persecutions under the direction of Charles V. of Spain (1519-55) and his son Philip (1555-81) while disturbing in a greater or less degree the peace of those countries holding the Reformed faith, it was sturdy little Holland which received the full fury of the sword and under the leadership of William of Orange achieved those victories that gave her civil and religious liberty. In six years

DUTCH REFORMED CHURCH IN AMERICA

from 1567-73, over 100,000 men gave up their lives to purchase such liberty. Great enthusiasm was aroused by holy and learned men, who while preaching the Gospel in the open fields, also urged resistance to every power opposed to the progress of the Reformed faith. Added to this, the devotion of the people was expressed in song. The hymns of Beza and Marot became an inspiration. Men everywhere sang them as they stood in the thickest of that fight whose outcome they determined should be religious liberty for themselves and their children. But while the Prince of Orange was able in time (1576) to carry his negotiations so far as to bring about "the Pacification of Ghent," it was not uninterrupted peace. Out of those troublous times, in 1579, came the "Union of Utrecht." Seven northern provinces of Holland bound together by a common faith making this the motto of their covenant, *Eendracht maakt macht* ("Union makes strength")—a sentiment used to-day by the American Reformed Church on its seal. The independence of the northern provinces, however, was yet to give place to something broader and grander. It was the founding of the Dutch republic with a history too resplendent to be given in detail, excepting to say that her career in everything that ennobles a people—her universities, her diplomacy, her constitution, her arts, sciences, and her maritime and commercial power became, and are yet, the admiration of the world.

It was, however, in the darkest days of her history that Holland was busy in formulating the doctrinal standards of the Reformed Church, its liturgy and polity. It was in 1566 that some Walloon and Dutch pastors met at Antwerp, and, joined by a few nobles, proceeded to form the first regular Church organization. The Belgic Confession, written by De Beers, with some slight alterations, was put among its doctrinal standards. The Heidelberg Catechism, written by Ursinus and Olivianus of the Palatinate, was also accepted, but not fully endorsed until a later period. This Antwerp organization might properly be called the first synod of the Church of Holland. Doctrinal standards were endorsed and adopted, although declaring at the time that the Word of God was their only rule of faith, and much of this work was afterward confirmed by the greater synods that followed.

The Synod of Wesel was held in 1568. This synod did more toward shaping the policy of the Church. Calvin's Presbyterian polity was modified as suited their circumstances and adopted. A learned and godly ministry loyally endorsing their faith was made a necessity and the duties of church officers were carefully defined. Three years having passed with their land yet under the ominous cloud of Charles V., the Synod of Emden was called in 1571. The acts and proceedings of the Synod of Wesel were re-endorsed, with new features of church government formulated and arranged. The first Synod of Dort—the first of the national synods—was called in 1576 at Dortrecht, Holland. The government of the Church was farther perfected in defining the four grades of ecclesiastical bodies, namely: The general synod—the highest council, synod classes and consistories. It also declared what thereafter should be the conditions of church membership. Following this was the important Synod of Middleburg,

held in 1581. Its chief work was to complete the organization of the Church, arranging all matters relating to schoolmasters, professors of theology, liturgy, and creed, with which in the deposition of Philip II., a month later, the Reformed Church became the established Church of the Netherlands. The great Arminian controversy that was agitating the young Church in the early part of the 17th century was the immediate cause of the calling of the second Synod of Dort in 1618. All of the Reformed churches of Europe were invited to send delegates and most of them responded. James I. of England sent the Bishop of Llandoff, Samuel Ward, professor at Cambridge, and Joseph Hall, who afterward became Bishop of Salisbury. The doctrines of grace respecting fore-ordination, the perseverance of the saints, sin, and the conversion of man, the atonement, upon which Arminius was believed to hold unsound views, became subjects of earnest discussion. The Remonstrants who, headed by Episcopius, supported Arminius, were excluded from office in the Reformed Church and in a learned formula called the 'Canons of the Synod of Dort,' the synod's views upon these great doctrines were accurately defined. When the foreign delegates had withdrawn from the synod at the close of the 14th session, the Dutch delegates remained and acted as a third National Synod. These proceedings were called "post-acta," and much was done to develop much farther the working power of the young Church. The call to the ministerial office, festival days, hymns to be used in worship, baptism of adults and the sick, professors of theology and their relation to the Church, a new translation of the Bible into Dutch, foreign missions, profanity, the liturgy, and also ministers' salaries, were matters provided for. Yet again the Heidelberg Catechism came up for discussion and was re-adopted with enthusiasm, ordered to be taught in the schools, in the home, and explained in the churches every Sabbath. A 'Compendium' of its teachings was prepared and put among its standards of doctrine.

It was about this time that Holland immigration to America began. For 20 years before the Dutch East India Company had been pushing its commercial enterprises in the Indian Ocean. To find a shorter route to India it sent Hendrik Hudson on his voyage of discovery. The result was he explored in 1609 the river which bears his name. Five years later the country between Virginia and New France, or, measured on the coast line, from the 40th to the 45th parallel of latitude was taken possession of, made a province of in 1623 and was called the New Netherlands. In 1621 a West India Company, an armed corporation, with unlimited powers of colonization, and with great power on the sea was formed and with it Dutch immigration was more widely extended. Settlements began to form about New York Bay and in the vicinity, while Manhattan Island was at once occupied and held by the West India Company. In 1626 Peter Minuet, born of Huguenot parentage, an elder in the French Reformed Church at Wesel, came to America commissioned as director of the now powerful West India Company. To strengthen the company's hold upon Manhattan Island he bought it of the Indians for the sum of \$24. With the coming of Minuet began the first religious services in the

DUTCH REFORMED CHURCH IN AMERICA

New Netherlands. He brought over with him two *Krankenbesoekers* or comforters of the sick—devout men who in a commodious room over a horse-mill held religious services. These were held until the arrival of the first minister, Rev. Jonas Michaelius, early in 1628, when the first Church of the Reformed faith was organized in 1628. Fifty communicants were present at the first Lord's Supper, among them some Walloons. The Walloons were of the Reformed Church in Belgium, bordering on Holland, and who spoke the old French language, hence called by the Dutch *Waalche*, corrupted to Walloon. Many of them settled on Long Island in the vicinity of Wallabout, or Walloons bay or cove. The ecclesiastical connection of the new Church was with the Classis of Amsterdam in Holland. The Rev. Everardus Bogardus took the place of Michaelius in 1633. With him also came the first schoolmaster of the colony. The loft over the horse-mill was now replaced by a plain wooden church at what is now 100 Broad Street, between Pearl and Bridge streets, New York. The "dominie," as the minister was called, had a house and stable near. The Church now began to grow slowly, and accessions were made from other countries. Up to the time of the English conquest in 1664, and after various vicissitudes, there were 13 organized churches doing their work on American soil. Dutch immigration continued, and settlements were made in New Jersey, along the Hudson River as far as Fort Orange (Albany) and on Long Island, with good work done in adjacent settlements.

In the early part of the 18th century, the young Church began to feel the necessity of new pastors for their many vacant churches. It was getting to be inconvenient to look to Holland for men ordained by the Classis of Amsterdam. The necessity of managing their own Church affairs themselves, and of educating and ordaining their own ministry was now becoming imperative. How this could be done at first was not clear either to the Church in Holland or America. A Coetus, or an association, was finally proposed that might be given authority as a high judicatory in the New Netherlands and have the power of ordination. After much opposition both in Holland and in the colony permission was granted which existed for six years until 1754. In that year began the great disruption, when the young Church became divided into the Coetus and the anti-Coetus parties, but they came together again upon a basis of union of 1772. The Colonial Period, 1771-92, was now passing away and it was also a period of transition to the Church. Changed conditions made it necessary to broaden the 84 articles of the Synod of Dort by adding 73 explanatory articles adapting the whole ecclesiastical machinery to the entire freedom the Church was now enjoying. Minor changes were afterward made in the constitution of the Church at two different times and in 1867 the Dutch Reformed Church after a warm discussion became the Reformed Church in America.

The Church never had a widely scattered constituency—its growth has uniformly followed the lines of Dutch immigration—it is chiefly found to-day doing its quiet work throughout the States of New Jersey, Pennsylvania, New York, and in many of the Western States. The constitution of the Church consists of its

standards of doctrine, its liturgy, and its rules of government. Its liturgy has come down from the Church of Holland, but its use is optional, excepting the forms for the Lord's Supper, baptismal forms, and forms for ordination. In doctrine the Church is moderately Calvinistic. The fundamental thought is Divine Sovereignty, and in all its standards, what are called the doctrines of grace are given emphasis. Its standards of doctrine are the Belgic Confession, the Heidelberg Catechism, and the Canons of the Synod of Dort, together with a 'Compendium' explanatory of the Catechism. All ministers and teachers of theology are obliged to subscribe to these standards. The form of government is Presbyterian, having four church courts, the consistory consisting of the pastor and the elders and deacons, which are chosen from the congregation every two years, the Classis, a semi-annual convention of adjacent churches represented by pastors and elders, the Particular Synod, meeting annually, composed of ministers and elders delegated by each Classis, the General Synod, delegates appointed by each Classis, and elected by the Particular Synod. There is 1 General Synod, 5 Particular Synods, and 35 Classes representing 652 churches, and 700 ministers.

The Dutch Reformed Church has always insisted upon an educated ministry. Next to being the oldest body of Presbyterians in America, it may also claim to have established the first School of Theology (1784). Before that the ministers of the Church came from Holland, while a few went there for their education. The Theological Seminary at New Brunswick, N. J., with its six professors, is the result of the modest beginning. A second Theological Seminary is at Holland, Mich., and a third is connected with the Church's missionary work in India. This Church is also believed to have antedated any other body in founding the first college. A charter for a college was granted by Gov. Franklin of New Jersey in 1766, but a second and amended charter under which it organized was granted 20 March 1770, called Queens College, afterward changed to Rutgers College, and permanently located at New Brunswick, N. J. The New Jersey State Scientific School is also a part of the institution. The great immigration from Holland to Michigan and the neighboring States in 1847 and their prosperity made it soon appear that their high school which had passed under the control of the General Synod as Holland Academy, must soon expand to the proportions of a college. This it did in 1866 and Hope College took its place among the flourishing institutions of the West. A "board of education" to assist indigent and godly young men in pursuing their studies for the ministry was one of the early conceptions of the Church, and put in practical form in 1828. Later in 1865 the board was empowered by the Synod to co-operate with the Classes in the establishment of academies and classical schools.

The Dutch Reformed Church early imbibed the missionary spirit. Its home work was coincident with its history. As early as 1790, much work was done in scattered fields—in Canada, and later, in the Middle States and the West. "The Missionary Society of the Dutch Reformed Church," organized in 1822, had all the missionary work of the Church under its care. In 1844

DUTCH RUSH—DUTCH WEST INDIA COMPANY

it took the name of "The Board of Domestic Missions," and much of the increase in the number of churches is due to its work. The Church did its Foreign Mission work through the American Board, beginning in 1832 and continuing until 1857, when it began its independent work. As the Board of Foreign Missions of the Church, it has had since that time in its several fields 200 missionaries. It has fields in India, China, Japan and Arabia, employing 80 missionaries, 350 native helpers, 27 native ministers, with 40 churches and nearly 5,000 communicants. One of the most invaluable helpers in this work was the organization of the Woman's Board of Missions in 1875, since which time it has contributed toward the general work more than \$600,000. Its contributions in 1900-1 were more than \$34,000. The young people of the Church are also organized in Christian Endeavor societies, co-operating with such societies everywhere in their work in the world. See CHURCH; PRESBYTERIAN.

REV. EVERT VAN SLYKE.

Dutch Rush, a common name for the scouring rush or shave grass (*Equisetum hyemale*), a plant of the horsetail family, used for scrubbing floors in country places, and imported from Holland as an article of commerce, to be used in polishing hard woods and alabaster. The stems are filled with silica deposited in a regular manner, forming an integral part of the plant. It is native throughout Europe, Asia, and nearly the whole of North America, where it is found in wet places, and along the banks of streams. See *Equisetum*.

Dutch School. See PAINTING.

Dutch in the United States. Holland's one effort at colonizing the northern New World was along the coast strip between the Hudson and Delaware (then known as North and South Rivers). Thence they penetrated inland, striking first of all up the Hudson to Albany, to establish fur-trade with the Indians, and thence westward to Schenectady; spreading east and west from New Amsterdam (New York), to the Connecticut settlements and on Long Island, and into New Jersey. They made a grasp at the Connecticut River, but were soon driven off it. The Delaware was fiercely contested with them by the Swedes, who left a strong impress there (see DELAWARE, *History*), but in vain; and the western side of New Jersey has considerable Dutch blood and settlement as well as the east, with not a little in Pennsylvania and Delaware. The English took all their possessions from them in 1664 (see NEW YORK, *History*), but of course did not root out their blood or traditions. The contribution of the Dutch to American institutions has been the subject of keen debate. Enthusiastic writers have credited them with pretty much everything distinctive of American institutions; partly and largely through the residence of the Pilgrims in Holland, it being assumed that the Pilgrims were unable to originate even such primitive ideas as that of confederations for protection except by imitating Holland; partly through the study of their institutions by the statesmen of the Constitution period. Democracy and religious freedom, written constitutions and the ballot, free religion and free schools, equal inheritances and state recording of deeds, have all been traced to

their example. Some influence on the Pilgrims is more than probable, especially in technicalities like the recording of deeds; and in the form of some few others there are significant similarities. But the wholesale character of their advocates' claims injures their cause. Democracy and equal inheritances were the result of the nature of the settlements; free schools existed among the Huguenots as well as the Dutch, and the people colonized on the basis of religious exposition of a book must train children to understand that book; the ballot is centuries older than Holland, and a written federal agreement was needed as security for its being kept. The extreme view is taken by Douglas Campbell, 'The Puritan in Holland, England, and America' (1892); a more moderate one by John Fiske, 'The Dutch and Quaker Colonies in America' (1899).

Dutch West India Company, The, an association of merchants of Amsterdam, Zealand, the Meuse, North Holland, and Friesland, incorporated 1621, with a capital of 6,000,000 florins (about \$2,500,000). Unlike the East India Company, which was primarily a trading association, and in its conquests and colonies had no other purpose than to protect its commerce, the West India Company never had an extensive trade, but strove to injure the Spaniards, to conquer their establishments, to capture their ships, and to break the intercourse between Spain and its American gold and silver mines. The design was conceived in the interest of the Belgians, when Spanish persecutions had driven more than 100,000 Protestant families from Belgium to the north. It was thought that the Spaniards would be compelled to evacuate Belgium when their resources had been thus destroyed. Large fleets were sent out, the company possessing sometimes as many as 70 armed vessels. The prizes captured were of such value that during several years shareholders received 25 to 75 per cent interest. Twelve millions were added to the original capital. Spain and Portugal being united at this time (the union lasting from 1580 to 1640), the company not only captured the Spanish silver fleet in 1628, securing a booty of more than 14 million florins, but took Bahia (1624) and Pernambuco (1630) in the Portuguese colony of Brazil. The history of Dutch Brazil had a brilliant period (1636-1642) under the administration of Count John Maurice of Nassau. Curaçao was taken about this time, and the company's North American colony of New Netherlands grew more and more prosperous. But the fatal defect of the company's plan now became apparent. Not being supported by extensive trade, the military and naval triumphs cost much more money than they produced. The financial condition of the company showed, after 1630, a terribly constant downward tendency; the government of Holland, moreover, was very slack in fulfilling its pledges of assistance. The beginning of the end was reached in 1641, when Portugal, having shaken off the Spanish yoke, devised means to regain Brazil. In 1654 the Dutch troops withdrew from that part of South America. The death-blow was struck when New Netherlands, the last valuable possession of the practically bankrupt company, was conquered by the English (1664). Consult: Asher's 'Bibliography of New Netherland and

DUTCH WEST INDIES—DUTY

the Dutch West India Company,' Amsterdam, 1856-67.

Dutch West Indies, The, islands of the Caribbean Sea belonging to Holland. They are: Curaçao (area 210 sq. miles, pop. 28,187), the capital of which, Willemstad, is the residence of the governor of all these small Dutch possessions; Buen Ayre (area 95 sq. miles, pop. 4,399); Oruba; one half of St. Martin (total area 38 sq. miles, total pop. 3,724); Saba (area 5 sq. miles, pop. 2,065); and St. Eustatius (area 8 sq. miles, pop. 1,613). The last three are members of the outer and inner Caribbean chains, and lie 300 miles northeast of the Curaçao group, which is near the Venezuelan coast.

Dutchman, The Flying, a phantom ship which sailors believed could often be seen about the Cape of Good Hope. The story is that a Dutch captain, Vanderdecken by name, being tossed about by adverse winds while trying to double the Cape, swore with many oaths that he would accomplish his purpose if he beat to and fro till the judgment day, and as a punishment his ship never touched land. Another version of the legend is that the Flying Dutchman is condemned to wander the seas forever because a murder was committed on board his ship.

Dutchman's Breeches. See DICENTRA.

Dutchman's Pipe, a common name for *Aristolochia macrophylla*, a plant of the birthwort family (*Aristolochiaceæ*). It has a twining stem, with very slender branches, the leaves broad and thin. The calyx tube is bent in such a manner that the flower suggests a pipe with a long stem. It grows in woods from southern Pennsylvania to Minnesota, Kansas, and Georgia. See ARISTOLOCHIA.

Dutra E Mello, Antonio Francisco, ân-tô'-nê-ô frân-thês'ko doo'trê â mël'lô, Brazilian poet: b. Rio Janeiro 8 Aug. 1823; d. 22 Feb. 1843. His verses are considered among the best of South American poetry. Among his choicest works are: 'A'noite Inspiração Poética'; 'A'noite de S. Toão'; and 'Historia Crítica da Lingua Latina.'

Dutt, doot, Romesh Chunder, East Indian scholar and civil servant: b. Calcutta 13 Aug. 1848. He was educated at Presidency College, Calcutta, and University College, London, at which latter institution he is lecturer on Indian History. He joined the Indian civil service in 1871, becoming a divisional commissioner in 1894, the first native of India to attain that position. In 1892 he was decorated for ability as an administrator, and his literary researches. Beside a series of novels in Bengali, and translations of the 'Rig Veda,' etc., into Bengali, he has published in English: 'Civilization in Ancient India'; 'Lays of Ancient India'; 'Mahabharata,' condensed into English verse; 'Ramayana,' condensed into English verse; 'England and India, 1875-85'; 'Famines in India'; 'Economic History of British India'; 'Lake of Palms: a story of Indian domestic Life.'

Dutt, Toru, Hindu poet: b. 1856; d. 1877. She received a good European education, and translated into English many French poems—from Béranger, Gautier, Coppée, etc. A collection of these was published as 'A Sheaf Gleaned in French Fields' (1876). She also rendered

into English some of the 'Ancient Ballads of Hindustan.' She wrote in French a story: 'Miss d'Arvers' Diary.'

Dutteeah, doot'tê-ä, Dattiya, or Datia, India, city, capital of a State of the same name, in the Bundelkhand Agency, on the route from Agra to Saugor, 110 miles southeast of Agra. The rajah's palace is situated within a pleasure ground of about 10 acres, inclosed by a lofty wall, with embattled towers at each of its four corners. A few miles distant are Jainas temples. (See JAINAS.) Pop. 27,566.

Dutton, Clarence Edward, American soldier and geologist: b. Wallingford, Conn., 15 May 1841. He was graduated at Yale in 1860, and two years afterward became captain of the 21st Connecticut Volunteers. He received a commission as second lieutenant in the United States army in 1863, and was promoted to the rank of major in 1890. In 1875 he joined Maj. J. W. Powell in the United States survey of the Rocky Mountain region; in 1879-80 was secretary of the United States land system committee, and from 1880 to 1891 was a member of the United States Geological Survey. He was elected a member of the National Academy of Sciences in 1884. His writings embrace the subjects of metallurgy, gunnery, and geology, to which last he has devoted his main literary attention. His most important geologic works are: 'Geology of the High Plateaus of Utah' (1880); 'Tertiary History of the Grand Cañon District' (1882); 'Hawaiian Volcanoes' (1884); 'Mount Taylor and the Zuni Plateau' (1886); 'Earthquakes' (1904).

Dutton, Edward Payson, American publisher: b. Keene, N. H., 1 Jan. 1831. He was educated at the Boston Latin School, entered the book business, and was a member of the Boston firm of Ide & Dutton, 1852-8. Having acquired the publishing interests of Ticknor & Fields, and of the General Protestant Episcopal Sunday-School Union & Church Book Society of New York, he consolidated the enterprises and founded the New York firm of E. P. Dutton & Co.

Dutton, Henry, American jurist: b. Plymouth, Conn., 12 Feb. 1796; d. New Haven, Conn., 12 April 1869. He was graduated at Yale in 1818, and became professor of law in the same university in 1847, occupying this position for 8 years, and in 1854 was elected governor of Connecticut. He was judge of the superior court, and court of errors 1861-6, and prepared many digests and compilations of State statutes, which are of permanent value to his profession.

Dutton, Samuel Train, American educator: b. Hillsboro, N. H., 16 Oct. 1849. He was graduated at Yale, 1873, and was superintendent of schools in Brookline, Mass., 1890-1900. He was a lecturer on pedagogy at Harvard, 1895-7; Chicago University, 1897; Vassar College, 1897-8; and Boston University, 1898. In 1900 he was appointed professor of school administration, and superintendent of Teachers' College School, in connection with the Teachers' College of Columbia University. He has written: 'Social Phases of Education,' and several school textbooks.

Duty, a tax or impost levied upon imports and frequently upon exports. In the United States duty payment is in the nature of a tariff levy, and is determined largely by the appraised

DUUMVIRS—DUYCKINCK

value of the dutiable article itself. The list of dutiable articles is very large in the United States, France, Germany, and Russia. It is small in England. Merchants who have occasion to pay duty usually enlist the services of a custom-house broker, who is charged with the protection of his client's interests. Duty payments to the United States may in certain cases be deferred, the imported articles being held in bonded warehouses by the government. The stamp duty is a well-known tax in Great Britain. At the close of the Civil War and for a short time after the Spanish-American war, the United States levied a duty to meet war indebtedness by taxing medicines, matches, and other proprietary articles. See CUSTOMS DUTIES; STAMP TAX; TARIFF; etc.

Duumvirs, dū-ūm'vĕrs, among the ancient Romans, two magistrates, or officers, appointed for a particular purpose. They were therefore of various sorts, and were specially named from the nature of their functions. The *duumviri iure dicundo* were the highest magistrates of colonies, and towns, where they had the rank of consuls at Rome. The *duumviri navales* had charge of the construction and equipping, and sometimes of the command of fleets. The *duumviri quinquennales* were the censors of municipal towns.

Duval, dū-vāl, **Alexandre**, French dramatist: b. Rennes 6 April 1767; d. Paris 10 Jan. 1842. He served in the French fleet during the American Revolutionary War, and on his return to France was an engineer and architect; but finally devoted himself to writing plays, which won great favor from their skilful construction, interesting situations, and fine dialogue. The best are: 'Edward in Scotland' (1802); 'The Domestic Tyrant' (1805); 'The Youth of Henry Fourth' (1806); 'The Chevalier of Industry' (1809). He wrote the text of the very successful opera, 'Joseph in Egypt' (1807).

Duval, **Claude**, English highwayman: b. Domfront, Normandy, 1643; d. London 21 Jan. 1670. He went to England at the Restoration, in the train of the Duke of Richmond. Taking soon to the road, he robbed many gentlemen of their purses, and ladies of their hearts, till, having been captured while drunk, he was hanged at Tyburn, and was buried in the central aisle of Covent Garden Church.

Duveneck, dū'vĕn-ĕk, **Frank**, American artist: b. Covington, Ky., 1848. He began his artistic education as pupil in the studio of Dietz, at Munich, making a specialty of portraits and genre. Many of his pictures are in this country, although he has lived much abroad, and since 1881 has taught and painted at Florence, Italy. He was awarded a medal at the Columbian Exposition of 1893.

Duvergier de Hauranne, **Jean**, zhōn doo-vĕr-zhĕ-ā dĕ ô-rān, French theologian: b. Bayonne 1581; d. Paris 11 Oct. 1643. At the University of Louvain, where he studied theology, one of his fellow students, and his most intimate friend, was Cornelius Jansen (q.v.), after whom a certain system of theological views is named—"Jansenism." The two friends, after both had left the university, continued their intimate relations, first at Paris, then at Bayonne, where Duvergier had been appointed to a prebend. When Jansen left Bayonne Duvergier resigned his prebend, and went back to Paris. All

this time the two men had diligently been studying the ancient fathers of the Church, and in particular St. Augustin, from whom Jansen claimed to have drawn his doctrine of Divine Grace. In Paris Duvergier's winning personality and his reputation for austere views of religious and moral obligations, commended him to the favor of the bishop of Poitiers, who gave up to him the monastery, or abbey, of St. Cyran, and there Duvergier, having brought together a number of devout men, formed them into a convent of monks, under the ancient, unamended rule of St. Benedict. But his zeal for reform of the monastic life was suspected of being inspired by a secret hostility to the Church and the Church's rulers, and Duvergier was compelled to retire from St. Cyran, whence he returned to Paris. There he was received with great favor by the highest society, especially the feminine element, and in particular he became the trusted counsellor of Angelique Arnauld, abbess of Port Royal, and all the members of the remarkable Arnauld family, those staunch defenders of Jansenism (see ARNAULD). A sect was formed and Cardinal Richelieu had strong suspicions that the Abbé of St. Cyran was leader in a conspiracy against Church and state; so he was arrested by order of the cardinal, and committed to the Castle of Vincennes 14 March 1638, where he was held in close confinement as long as Richelieu lived, or till December 1642; and he survived his liberation only a few months.

Duvergier de Hauranne, dū-vĕr-zhĕ-ā dĕ ô-rān, **Prosper**, French publicist: b. Rouen 3 Aug. 1798; d. Paris 22 May 1881. He went to London, and became in 1824 a constant contributor to the *Globe*. He was elected deputy from Sancerre, and in the national assembly he supported Casimir-Perier, and Thiers, while opposing Guizot, who had been his friend and associate on the *Globe*. After the *coup d'etat* of Napoleon III. he was imprisoned for a while, and eventually sentenced to banishment, but was subsequently allowed to return to Paris. He became a member of the Academy in 1870 and among the works which won him reputation is to be mentioned 'Histoire du gouvernement parlementaire en France' (10 vols., 1857-70).

Duvernoy, **Georges Louis**, zhōrh 100-ē dū-ver-nwā, French naturalist: b. Montbéliard 6 Aug. 1777; d. Paris 1 March 1855. In 1802 he was invited by Cuvier, to whom he was related, to assist in editing his treatise on comparative anatomy. With the aid of the notes and counsels of his master, he prepared the last three volumes of this work, embracing the organs of digestion, respiration, circulation, generation, and the secretions. In 1827 he was elected professor of the faculty of sciences at Strasbourg, where, during 10 years, he published a variety of papers on anatomical subjects; and after the death of Cuvier was engaged in arranging his papers for publication. In 1837 he was elected professor of natural history in the College of France. He published numerous works, which have furnished important materials to anatomists and zoologists.

Duyckinck, dī'kĭnk, **Evert Augustus**, American author: b. New York 23 Nov. 1816; d. there 13 Aug. 1878. Graduating from Columbia College, he studied law, was admitted to the bar in 1837, and went to Europe for a year, after which he devoted himself to literature, in

DUYCKINCK — DWARFED TREES

which he was fertile and successful. With his brother, George, he prepared the 'Cyclopædia of American Literature' (1855; enlarged eds. 1865 and 1875). He was a voluminous and successful writer, and added much to the literature of his time. His last work was the preparation, with William Cullen Bryant, of an edition of Shakespeare.

Duyckinck, George Long, American author: b. New York 17 Oct. 1823; d. there 30 March 1863. He was a brother of E. A. Duyckinck (q.v.), and with him prepared the 'Cyclopædia of American Literature.' He was also the author of 'George Herbert of Bemer-ton' (1858); and 'Life of Bishop Thomas Ken' (1859).

Duzine (derived from the Dutch "dozijn"), or THE TWELVE MEN, the twelve patentees in 1677 of the Huguenot settlement on the Walkill, now in Ulster County, N. Y., and known as New Paltz (New Palatinate) from their German refuge after escaping from France. The "duzine" and their successors were the executive and legislative body of the settlement during a century.

Dvorák, Antonín, ä'n-tō'n-in dvōr'zhāk, Bohemian composer: b. Mühlhausen, Bohemia, 8 Sept. 1841; d. Prague, Bohemia, 1 May 1904. At first intended for his father's trade of butcher, he showed such musical ability that he was allowed to study the organ. For a time he played the tenor violin in a theatre orchestra in Prague, and was also organist for several churches. In 1873 he first made himself known as a composer by a patriotic hymn for chorus and orchestra, and not long afterward an opera of his was successfully produced. His first great success was his setting of the 'Stabat Mater,' first performed in England in 1883, which at once raised him to the rank of a popular and widely-known composer. Among his subsequent works are songs, operas, dances, symphonies, a wonderful cantata, 'The Spectre's Bride,' first performed at Birmingham in 1885, the composer himself acting as conductor, and an oratorio, 'St. Ludmilla,' first performed at Leeds in 1886 under his own direction. Dvorák is characterized by a brilliant imagination, great originality, and a rare inventive power. His 'Stabat Mater,' which betrays less of the Bohemian nationality than many of his other works, is regarded as one of the greatest works of its kind in modern music. In 1892 he was called to New York as director of the National Conservatory of Music.

Dwarf, a human being much below the ordinary size of man. Dwarfs are described by several ancient classical writers. Herodotus gives an account of a race of dwarfs living in Libya and the Syrtes, to which Aristotle and Pliny also refer. Henry M. Stanley, in his journey across Africa in 1888, came on a dwarfish race which he thought might be descended from that mentioned by Herodotus. Philotas of Cos, distinguished about 330 B.C. as a poet and grammarian, was jocularly said to have carried weights to prevent his being blown away. He was preceptor to Ptolemy Philadelphus. Julia, niece of Augustus, had a dwarf named Coropas, two feet and a hand's breadth high; and Andromeda, a fremaid of Julia's, was of the same height. The best known of modern dwarfs was

Charles S. Stratton, or, as he was popularly called, "Tom Thumb," who was 31 inches high at the age of 25. He was born in Bridgeport, Conn., and traveled extensively abroad and at home under the management of P. T. Barnum. Wherever he went he attracted great attention, even from such personages as Queen Victoria and Napoleon III. Another modern dwarf was Francis Flynn, "Gen. Mite," who was 21 inches in height at 16 years.

In Scandinavian mythology dwarfs (*Dverg-gar*) are inhabitants of the interior of the earth, and especially of large isolated rocks. They were imagined to be dark in aspect like the caverns in which they dwelt, and were often styled "dark elves." A dwarf was set by the gods at the corner of each of the four quarters of the earth to bear up the sky; and they were named East, West, North, and South. All the dwarfs were esteemed great artists in working metals, and weapons of marvelous properties were said to be produced from their subterranean workshops. Like the Jotuns, they could not endure the sunlight, and if its rays touched them they were turned into stone. If a man met a dwarf away from his rock, and could throw steel between him and it, it was believed that thereby his habitation was closed up, and that any thing in his power could be extorted from him. In the old Norse, echo is called the "dwarf language," probably because it was thought to be produced by the dwarfs within mountains imitating the sounds which they heard without.

Dwarf Snake, a common name for small snakes of many genera, given in the United States to species of the genus *Carphiophiops*, which are found in the South in old logs. They are brown above and yellow or salmon below. The name is also applied to a pretty little snake of the genus *Haldea*, small and slender with coloring similar to the dwarf snakes of the first genus, but with a dark brown band across the head. It destroys insects and is harmless.

Dwarfed Trees, a favorite ornament for dwellings among the Japanese and Chinese, who adopt a peculiar method of dwarfing. They choose some fruit- or flower-bearing branch of any tree of which they wish to produce a dwarf specimen, and cutting off a ring of the bark, surround the stripped part with clay, which they keep moist by means of a covering of moss, which is watered when it becomes dry. After a period, varying in different trees from about 3 months to 2 years, roots are sent out by the branch into the clay. The branch is then cut off below these artificial roots, and planted in a poor soil, where it is kept scantily supplied with water. In this state the tree will remain for years, with vitality enough to produce leaves and even flowers annually, but never producing any but abortive shoots. Another method is to plant trees in flower-pots with a shallow covering of soil, supplying them, as in the former case, very sparingly with water, and pinching off all the strongest shoots. Still another method, which is said to give good results when tried by amateurs, is to enclose a seed in a small pellet of earth which is placed in the centre of a ball of absorbent moss, then is crowded into the interior of an orange from which the pulp has been removed. The moss is liberally supplied with water until the roots appear on the outside of the orange, when they

DWARKA — DWIGHT

are cut off and the orange-skin covered with varnish, and placed in a flower-pot. Thereafter only enough moisture is applied to support the life of the plant.

Dwarka, *dwār'kā*, India, a maritime town of the district of Guzerat, on the west side of the peninsula of Kathiawar, in the dominion of Baroda, 235 miles southwest of Ahmedabad. On an eminence overhanging the seashore stands a great temple of Krishna, visited annually by 10,000 pilgrims. Dwarka is claimed as the birthplace of Krishna. Pop. 5,121.

Dwight, Benjamin Woodbridge, American educator and author: b. New Haven, Conn., 5 April 1816; d. in 1889. He was graduated at Hamilton College, New York, in 1835, and became a teacher, being engaged, during a large part of his life, as principal and proprietor of a school in Brooklyn and New York, in preparing boys for college. Among his works are: 'The Higher Christian Education' (1859); 'Modern Philology' (1864); and 'The True Doctrine of Divine Providence.'

Dwight, Edmund, American merchant: b. Springfield, Mass., 1780; d. 1849. He was graduated at Yale in 1799, and became the head of a flourishing business at Chicopee, and Holyoke. He was one of the main agents in establishing the Massachusetts State Board of Education, and the normal school system of the State.

Dwight, Francis, American educator: b. Massachusetts 14 March 1808; d. 15 Dec. 1845. He was graduated at Harvard College in 1827 and at the Law School in 1830; traveled extensively in Europe, and afterward practised law (1834-8), but in 1838 turned his whole attention to the promotion of common school education in our country, and established at Albany, N. Y., in 1840, 'The District School Journal,' under State patronage.

Dwight, Harrison Gray Otis, American missionary: b. Conway, Mass., 22 Nov. 1803; d. Shaftesbury, Vt., 25 Jan. 1862. He was graduated at Hamilton College, Clinton, N. Y., 1825, and became a missionary of the American Board of Commissioners for Foreign Missions in 1830, to the Armenians, making Constantinople the centre of his field of operations. He was abundant in his labors, and met with great success in his work. He wrote 'Researches of Smith and Dwight in Armenia,' and 'Christianity Revived in the East' (1850).

Dwight, John Sullivan, American musical critic: b. Boston 13 May 1813; d. Boston 5 Sept. 1893. After two years in the Unitarian ministry he became one of the founders of Brook Farm and was editor of its organ, the 'Harbinger.' In 1852 he established 'Dwight's Journal of Music,' in which appeared most of his scholarly musical criticisms. His best-known poem is 'God Save the State.' See Cooke, 'Biography of John S. Dwight' (1898).

Dwight, Joseph, American soldier: b. Hatfield, Mass., 16 Oct. 1703; d. Great Barrington 19 June 1765. He graduated at Harvard University in 1722; became judge of the court of common pleas of Hampshire County, Mass., and afterward of Berkshire County, and judge of probate. He was eminent both as a judge and a soldier. He commanded the Massachusetts artillery at the reduction of Louisburg in 1745 with distinction, and led a brigade at Lake

Champlain in the second French War in 1756. He was also for 11 years a member of the general council of Massachusetts.

Dwight, Nathaniel, American educator: b. Northampton, Mass., 31 Jan. 1770; d. 11 June 1831. He was a brother of Timothy Dwight the elder (q.v.) He prepared and published the first school geography ever issued in the United States, and was also the author of 'The Great Question Answered,' and 'A Compendious History of the Signers of the Declaration of Independence.'

Dwight, Sereno Edwards, American Congregational clergyman: b. Greenfield Hill, Conn., 18 May 1786; d. Philadelphia, Pa., 30 Nov. 1850. He was a son of Timothy Dwight (1752-1817). He was graduated at Yale 1803, and practised law in New Haven until 1816, when he entered upon a clerical career. He preached in Park Street Church, Boston 1817-26, and was president of Hamilton College, Clinton, N. Y., 1833-5. Among other works he published: 'The complete writings of Jonathan Edwards with a Memoir' (10 volumes 1830).

Dwight, Theodore, American journalist: b. Northampton, Mass., 15 Dec. 1764; d. New York 12 June 1846. He was a brother of Timothy Dwight, the elder. He was a well-known Federalist, a member of Congress, and wrote 'History of the Hartford Convention' (of 1814), and 'Character of Thomas Jefferson.'

Dwight, Theodore, American writer: b. Hartford, Conn., 3 March 1796; d. Brooklyn, N. Y., 16 Oct. 1866. He was a son of the preceding. He wrote: 'Tour of Italy' (1824); 'Summer Tour in New England'; 'The Northern Traveler'; 'The Kansas War' (1859); 'Life of Garibaldi' (1859); besides gazetteers, histories, and school books.

Dwight, Theodore William, American educator, jurist, and editor: b. Catskill, N. Y., 18 July 1822; d. Clinton, N. Y., 28 June 1892. He was educated at Hamilton College, and was professor of law there and subsequently in Columbia College, in each of which he founded a law school. He was elected (non-resident) professor of constitutional law in Cornell University in 1868. He was interested in philanthropic work, and served as president of the New York Prison Association, vice-president of the New York Board of State Commissioners of Public Charities, and as a member of the "Committee of Seventy," of New York. In collaboration with E. C. Wines he published 'Prisons and Reformatories in the United States,' and was associate editor of the 'American Law Register.'

Dwight, Timothy, American Congregational clergyman: b. Northampton, Mass., 14 May 1752; d. New Haven, Conn., 11 Jan. 1817. In 1769 he was graduated at Yale College, and in 1771 became a tutor there. In 1783 he was ordained as minister at Fairfield, Conn., where he opened an academy. In 1795 he was elected president of Yale College, and he also held the professorship of theology. His chief works are: 'The Conquest of Canaan,' and epic poem (1785); 'Theology Explained and Defended, in a Series of Sermons' (1818); 'Travels in New England and New York' (1821). Consult: Sprague, 'Life of Timothy Dwight,' in Spark's 'American Biography.'

Dwight, Timothy, American Congregational clergyman: b. Norwich, Conn., 16 Nov. 1828. He is a grandson of Timothy Dwight (1752-1817). He became professor of sacred literature at Yale Divinity School in 1858, and was president of Yale University from 1886 till 1898, when he resigned. He was one of the members of the New Testament Revision Committee. He published 'The True Ideal of an American University.'

Dwight, William Buck, American geologist: b. Constantinople, Turkey, 22 May 1833. He is a son of H. G. O. Dwight (q.v.). He was graduated at Yale in 1854, at the Union Theological Seminary, New York, in 1857, and at the Yale Scientific School in 1859. He has filled several educational posts in a scientific capacity, and since 1878 has been professor of natural history and curator of the museum at Vassar College. In 1891 he invented and patented a rock-slicing machine for the scientific section of minerals, for which he was awarded a bronze medal at the Paris Exposition of 1900.

Dwina, *dwēnā*, **Dvina**, or **Northern Dwina**, a river of Northern Russia, formed by the union of the Sukhona and Withegda Rivers, in the government of Vologda. It flows northwest and enters Dwina Bay, an arm of the White Sea, about 25 miles below Archangel. The whole course, from the source of the Withegda, is over 1,000 miles. Canals connect the Dwina with the Volga and the Neva.

Dyaks, *dī'āks*, or **Dayaks**, the name of the natives of Borneo. They are divided into innumerable tribes differing pretty widely in language, customs, and degrees of savageness. Physically they closely resemble the Malays, to whom they are doubtless akin, but are somewhat taller; they are intelligent, hospitable, and unsuspicious, and greatly excel the Malays in truthfulness and honesty. Many of the dialects spoken by them are little known. The coast tribes have adopted many Malay words, and some have completely adopted the Malay speech. Even the most uncivilized tribes have many ingenious arts and industries, weave cloth, make excellent steel weapons, and erect most serviceable suspension bridges with bamboo poles and withes. Their chief weapon is the blow-pipe, not the bow. The barbarous custom of systematic head-hunting is dying out, though the heads of enemies are still cherished trophies of the warrior. See BORNEO.

Dyce, Alexander, English Shakespearian scholar: b. Edinburgh 30 June 1798; d. London 15 May 1869. He was educated at Exeter College, Oxford; and, taking orders, held several curacies prior to 1827, when he settled in London, where the most of his life was passed. He was first brought to notice by his 'Specimens of the British Poetesses' (1825), which was followed by editions of Collins (1827), George Peele (1828), Webster (1830), Robert Greene (1837), Middleton (1840), Beaumont and Fletcher (1843-46), Marlowe (1850), Shirley (1833), Skelton (1843), Wotton, and Drayton, all of which were accompanied by notes and biographies of the authors. In 1840 he founded, in conjunction with Collier, Halliwell, and Wright, the Percy Society, for the publication of ancient comedies and ballads. His chief labors, however, were devoted to Shakespeare, an

edition of whose works he published in 1857; second edition, greatly improved, nine volumes (1864-67). In his 'Remarks on Collier's and Knight's Editions of Shakespeare' (1844); he pointed out several errors into which the modern commentators on Shakespeare had fallen; and in another work, entitled 'A Few Notes on Shakespeare' (1853), he pronounced very strongly against the emendations of the text of Shakespeare published by Collier, and maintained by him to belong to the first half of the 17th century.

Dyce, William, Scottish painter: b. Aberdeen 19 Sept. 1806; d. Streatham 14 Feb. 1864. In 1830 he settled at Edinburgh, where he soon became known as a portrait-painter and as a distinguished contributor to the exhibition of the Royal Scottish Academy. In 1827 he had exhibited at the Royal Academy his 'Bacchus nursed by the Nymphs.' About 1837 he settled in London. In 1836 he exhibited 'The Descent of Venus,' the subject of which was taken from Ben Jonson's 'Triumph of Love'; and in 1839 'St. Dunstan separating Edwy and Elgiva.' When the decoration of the interior of the new houses of Parliament was made a subject of competition Dyce exhibited his talents in a new light, namely, as a painter in fresco. His first fresco, 'The Consecration of Archbishop Parker,' was executed in Lambeth Palace, and was followed by 'The Baptism of Ethelbert,' in the House of Lords (1846). In 1848 he was commissioned to paint a series of seven frescoes in the House of Lords, but he only lived to complete five. Among his other pictures are: 'Joash Shooting the Arrow of Deliverance' (1844); 'Virgin and Child' (1846); 'Omnia Vanitas' (1849); 'Meeting of Jacob and Rachel' (1850); 'King Lear and the Fool in the Storm' (1851); and 'John Leading Home the Virgin' (1860).

Dyea, *dī'ā*, Alaska, an unimportant village, which was, however, important during the gold-rush, as being the starting-point of the Chilkoot Trail, a much traveled pathway to the valley of the Yukon, and the Klondike fields. The building of a railroad from Skagway (q.v.) reduced Dyea to its present insignificance. The census of 1900 gives the place less than 300 population.

Dyeing. Dyeing is the art of staining or coloring yarn or cloth. It has been practised among the eastern nations from time immemorial, and in the sacred writings, we read of the vestments of the high priest being dyed purple, and of linen cloths being dyed blue, purple, and scarlet. The famous Tyrian purple is supposed to have been discovered by the inhabitants of Tyre 1500 B.C., and immediately afterward Tyrian purple became the badge of royalty, and cloth dyed with it commanded a very high price. The Egyptians, Grecians, and Romans practised the art of dyeing, and it gradually became more widespread as civilization advanced. In earlier times dyeing was much more extensively followed as a domestic art than at present.

If the various coloring matters used in dyeing had an affinity for the fibre in its natural state, the process would be very simple. It would only be necessary to make a solution of the dye drug and immerse the goods to insure their being dyed. But so far from this being

the case, if we except indigo and safflower, there is scarcely a dyestuff that imparts its color to goods. The greater part of the dye drugs have so weak an affinity, for cotton goods especially, that they impart no color sufficiently permanent to deserve the name of a dye. The cause of this is obvious. If, for example, we take a decoction of logwood, the color matter is held in solution by the water. By putting a quantity of cotton into this solution, the fibre becomes filled with the colored solution, and if the cotton has no power to render that coloring matter insoluble within its fibres, it is plain that by taking out the cotton and putting it into water, the coloring matter within it will be diffused in the water. In other words, the dye having no attraction for the fibre, is washed out. This primary want of affinity makes dyeing sufficiently intricate and renders it more dependent upon science. Indeed, it is only by the careful arrangement of a few chemical laws, that the dyer is enabled to turn to advantage the various coloring matters of which he is in possession. When the dyer finds there is no affinity between the goods and any coloring substance which is put into his possession, he endeavors to find a third substance, which has a mutual attraction for the cloth and coloring matter, so that by combining these substances with the cloth and then passing the cloth through the dyeing solution, the coloring matter combines with the substance which is upon the goods and constitutes a dye. This third substance used, which acts as a mediator, combining two inimical bodies, is termed a mordant, from the French *mordre*, to bite, from an idea which the old dyers had that these substances bit or opened a passage into the fibres of the cloth, giving access to the color. Although the theory of their action is now changed, the term is still continued, and perhaps farther investigation will prove the term applicable.

All the mordants with one or two exceptions are found among the metallic oxides. In order that a substance may act as a mordant, it must possess certain properties. It must have an attraction for the coloring matter so as to form with it an insoluble colored compound and it must be held easily in solution. It may also have an affinity for the fibre and a tendency to unite with it, but this property is not essentially necessary; only the first two properties are so, and they limit the mordants almost entirely to what are termed the insoluble bases, that is substances which are not by themselves soluble in water. The bases or oxides, which are in general use as mordants, and which appear to succeed best are alumina and the oxides of tin and iron. The first two are colorless and the peroxide of the latter is a light brown and imparts to white goods the buff or nankeen color which in many cases affects to a considerable extent the color of the cloth, a circumstance which must also be attended to by the dyer. Indeed, the principal part of all dyeing operations is the proper choice and application of mordants; there being a chemical union between them and the coloring matter, a new substance is formed, not only differing in properties, but differing in color from any of the originals. Consequently, a very little alteration in the strength or quality of a mordant causes a decided alteration in the shade of color. However, it gives the dyer a much wider field for

variety of shades, and, at the same time, a less number of color substances are required. As, for example, logwood alone gives no color to cotton worthy the name of a dye, yet by judicious application of a few different kinds of mordants, all the shades from a French white to a violet, from a lavender to a purple, from a blue to a lilac, and from a slate to a black, are obtained from this substance. Before any chemical union takes place between bodies, they must not only be in contact, but they must be reduced to their ultimate molecules. Mordants that are insoluble of themselves, must be dissolved in some appropriate menstrua before their particles can enter the fibres of the goods or combine with the coloring matter. In doing this the dyer must attend to the degree of affinity between the solvent and the mordant to determine what force it will exert against the mordant combining with the fibres of the cloth should there exist an affinity between them. Otherwise, a powerful mordant may be weakened by the attraction of the solvent, as for example, common alum even though much concentrated, is but a weak mordant for cotton goods owing to the great attraction between the sulphuric acid and the alumina, but if the acetic acid, which has comparatively a weak affinity for the alumina, be substituted for sulphuric acid, it becomes a very powerful mordant.

It is with the vegetable coloring matters, however, that the greatest attention must be paid to the many conditions and properties of mordants. Bi-chromate of potash is largely used as a mordant for logwood and fustic for blues, blacks, browns, and a variety of shades of color. Bi-chromate of potash, alum, and oxalic acid as mordant on wool produce with logwood a very fine navy blue, but one that is not very fast to light. Sulphate of copper is used largely as a mordant with logwood for making black on cotton. These mordants are used almost exclusively for the wool dyes. In dyeing wool either raw, woven, or as yarn, care has to be taken that the wool is thoroughly free from grease before being mordanted. This is done by passing it through either soap, sal soda, or soda ash, and then thoroughly rinsing to free it from the alkali solution. If this is not done, unevenness in the dyeing is caused as well as a rubbing off of the color. When the dyer is given a shade to match he has to take into consideration the amount of fastness required, as where goods have to be heavily fulled, unless the colors are sufficiently fast, they will full out and be spoiled. In this case only such dyes can be used as will stand this process. The quantity of dye to be used depends on the class of wool to be dyed, as the finer the quality of the wool, the more dyestuff it takes to produce the same shade. The dyer also has to study to produce the result at the lowest possible cost, both for labor and dyestuff. Machines are now manufactured which economize in the labor and a large quantity of the goods are dyed at one time. It would be generally supposed that where the dyer carefully proportioned out his dyestuff to the weight of the material to be dyed, and observed every care in reference to the mordant and heat, that the shades would come out alike. However, this is not the case, and with the greatest amount of care the shades will vary and it is necessary to use extra skill

DYEING

after the shades get off the pattern to bring them again to the shade required. The dyer, knowing full well that owing to difference in the water and the stock in the goods, besides conditions that are not always understood, that the shade is apt to vary, goes light on the dyestuff and when he finds that he is not up to the shade required, he adds such dyestuff as is necessary to give the desired result. In fact, making the shade right when it is once off the pattern requires the very best efforts and skill on the part of the dyer. The dyeing of wool is a chemical combination. On the other hand, the dyeing of cotton is a fixation of the color in the pores of the cotton. Cotton is dyed in the raw state, pieces, and yarns, and the amount of dye used to produce a given shade also varies somewhat according to the quality of the staple. In using colors requiring a mordant, sumac and antimony are used, and the amount employed is governed by the depth of the shade required.

Dyeing of Mixed Fabrics.—The coloration of textile fabrics composed of more than one kind of material generally requires two or more processes, as the plan pursued in dyeing wool is seldom capable of fixing the color upon cotton. The customary plan followed is to immerse the fabric in the requisite baths to dye the wool and then to treat the partially dyed material in the manner found suitable for cotton. Occasionally the woollen thread of the cloth is dyed of one color, and thereafter the cotton is treated so as to acquire a different shade or color. With the coal tar colors recently brought out, mixed fabrics can be dyed in one bath, thus saving much time. The dyer is now able to produce, by combination of the different colors, a great variety of rich shades on mixed fabrics, and even to dye two shades in the same fabric, by first dyeing the wool with an acid dye, then cooling down his bath and adding his cotton dye, and dyeing the cotton another shade from what was produced on the wool. In dyeing silk, care has to be taken to free the silk from all gums, and this is done by boiling off in a soap bath. Most of the dyeing is done direct and under the boil.

In communicating the deep indigo blue to woollen cloth and yarn a vat is taken about six or seven feet in diameter, and eight to nine feet in depth, and nearly filled with water, along with from 18 to 22 pounds of indigo, finely ground in water, 10 to 20 pounds of madder, 7 to 9 pounds of bran, and 9 pounds woad. After the requisite boiling, and the addition of seven or eight pounds lime to form an alkaline liquid, in which the indigo can be held in solution, the whole is well closed over with tightly fitting wooden covers. Within 24 hours the putrid fermentation of the woad and bran proceeds the result of which is to abstract the oxygen from the blue indigo, the color of which is greatly reduced, until it assumes a yellowish color, and the solution then contains indigo white. If woollen cloth or yarn, is now dipped in this liquid, it comes out of a yellow tint from the attachment of the white indigo solution. But when exposed to the air, the oxygen immediately begins to act on the white indigo, combining with it so as to form oxidized or blue indigo, and as the process of oxidation proceeds, the yarn or cloth becomes first of a greenish and then of a blue color. If the cloth be again soaked in the yellowish

solution, and subsequently exposed to the air, the depth of the blue color may be increased, step by step, till it arrives at that deep shade of blue so well known.

In the dyeing of cotton with indigo the vat is prepared differently. The indigo is first ground into a thin paste with water, and afterward placed in a vat with protosulphate of iron and milk of lime. The lime (CaO) takes the sulphuric acid (SO_3) from the sulphate of iron (FeOSO_3) forming sulphate of lime (CaOSO_3), and liberating the protoxide of iron (FeO), which immediately abstracts the oxygen from the blue indigo, reducing it to white indigo and the latter dissolves in the excess of lime present in the vat, yielding a colorless solution. When cotton cloth or yarn is dipped in this it comes out of the vat almost colorless, but on exposure to the air, the indigo becomes reoxidized and the cloth passes to a green and ultimately to a deep blue shade. The cloth or yarn is then washed in water and afterward soaked in a very dilute sulphuric acid to remove any oxide of iron remaining attached and rewashed in water, when the blue color becomes more bright and clear. Fast fulling colors dyed either in the wool yarns or pieces, are usually dyed with the alizarine colors on account of their being fast to fulling and light. These are usually mordanted with bi-chromate of potash and cream tartar for one and a half hours at a boil. Then they are thoroughly rinsed in cold water and finished in another bath with the alizarine colors. Owing to the great affinity existing between the alizarine colors and the mordanted wool, great care has to be taken to enter the bath at a low temperature and very gradually bring to the boil to insure the goods being dyed even. Extra care must also be taken that only the amount of the alizarine necessary is added to produce the shade. Cotton is now largely dyed direct. Formerly dyers were obliged to give a number of baths and even then were not able in a great many cases, to secure the brilliant shades that are now dyed in one operation. The color simply being fixed in the pores of the cotton, it is more difficult to secure a fast color on this fibre than on wool. As in the case of wool, dyeing machines are now manufactured by which the cotton is dyed both in the raw state, yarns, and pieces, which economize in the labor and enable the dyer to produce better results both as to shade and fastness. During the last few years, there has been a large addition to the coal tar dyes, thus giving cotton dyers a much better opportunity to produce brighter and faster colors. Some of these are dyed direct, and thus making a great saving of labor, besides some are very fast both to light and washing.

The yarns for carpets are dyed almost exclusively with the coal tar dyes. This is done mostly in the yarn, and are dyed direct by entering them in the dye bath, which has previously had added the color, with the proper proportion of sulphuric acid and Glaubersalt, and gradually brought to the boil, being turned by hand. The bath is generally exhausted in about three quarters of an hour. The yarns furnished the dyer are frequently of a mixed material which is dark in color and in this case, he must choose the very brightest of dyes to give the required brightness of shade. For the

finer grades of carpets, the color must thoroughly penetrate and in matching shades the dyer usually cuts his yarn and matches from the centre.

F. H. PRESCOTT.

Expert in Dyes and Dyeing, Philadelphia.

Dyer, di'er, Alexander Brydie, American soldier: b. Richmond, Va., 1817; d. 1874. He was graduated at West Point, and joined the Third United States Artillery in 1837. He served in the Florida War of 1846, and was brevetted captain for gallant conduct. During the Civil War he was appointed chief of ordnance at Washington with the rank of brigadier general. In 1865 he was brevetted major general in the regular army.

Dyer, Sir Edward, English poet and courtier: b. Sharpham Park, Somersetshire; d. in London May 1607. An elegant courtier, he advanced himself in royal favor by court verse and was knighted in 1596. He will be longest remembered by his poem, 'My Mind to Me a Kingdom Is.' His works, 'The Shepherd's Conceit of Prometheus' and other poems, were not collected until 1872.

Dyer, Eliph'ale't, American jurist: b. Windham, Conn., 28 Sept. 1721; d. there 13 May 1807. He was graduated at Yale College in 1840 and began law practice in 1745. During the French War of 1755 he commanded a Connecticut regiment; was elected a member of council in 1762; chosen delegate to the Stamp Act Congress in 1765, and served as a member of Congress during the War of Independence.

Dyer, George, English antiquary and scholar: b. London 15 March 1755; d. there 2 March 1841. He was educated at Cambridge, and from 1792 till his death lived by literary work in London. He edited 'Valpy's Classics' and among other writings, published a 'History of the University and Colleges of Cambridge' (1814). Talfourd refers to his "simplicity of nature, not only unspotted by the world, but almost abstracted from it," and speaks of him as "breathing out at the age of 85 the most blameless of lives, which began in a struggle to end in a learned dream."

Dyer, John, English poet: b. Aberglasney, Carmarthenshire, Wales, 1700; d. 24 July 1758. He was originally a painter and his sense of beauty in scenery is shown in his 'Grongar Hill,' a poem published in 1727. He took holy orders in 1740, and received the living of Calthorpe, Leicestershire, in 1841, but eventually settled in Lincolnshire. He published 'Ruins of Rome' (1840); and 'The Fleece' (1857), by which latter poem he is best known.

Dyer, Louis, American writer and lecturer: b. Chicago 30 Sept. 1851. He was educated in early years in Chicago, Switzerland and France, was graduated from Harvard in 1874; and afterward studied at Balliol College, Oxford. He was assistant professor of Greek at Harvard (1881-87), and settled at Oxford in 1890, where he was lecturer at Balliol College (1893-96). He has lectured before the principal colleges of this country and published among other works 'Studies of the Gods in Greece at Certain Sanctuaries Recently Excavated' (1891).

Dyer, or Dyar, Mary, American martyr: d. Boston 1 June 1660. She was a victim to the persecution which befell the Quakers in the

early history of Massachusetts. The government of Massachusetts by a statute excluded Quakers from the bounds of that colony, and sentenced to death any one of that sect who should be guilty of a second visit there. The statute was little regarded, or rather was construed as an invitation instead of a menace, by the enthusiastic and devoted believers against whom it was directed. Mary Dyer had departed from the jurisdiction of the magistrates upon the enactment of the law, but soon after returned on purpose to offer up her life. She was arrested and sent to prison full of joy, wrote from the gaol a remonstrance in which she pronounced her persecutors disobedient and deceived, was relieved after being led forth to execution and after the rope had been put around her neck, and was against her will conveyed out of the colony. She speedily returned, and suffered as a willing martyr, being hanged on Boston Common.

Dyer, Nehemiah Mayo, American naval officer: b. Provincetown, Mass., 1839. He enlisted in the navy in 1861 and was promoted for gallantry in the Civil War, having attained the rank of volunteer lieutenant by 1865. He rose steadily through the grades to that of captain in 1897, and took part in the battle of Manila Bay the following year; was promoted rear-admiral in 1901 and retired the same year.

Dyer, Oliver, American journalist and author: b. Porter, Niagara County, N. Y., 26 April 1824. He was educated at Genesee Wesleyan Seminary, Lima, N. Y. In 1848 he was appointed stenographic reporter to the United States Senate, afterward became a reporter on the New York *Tribune*, and an editorial writer on the New York *Sun*. In 1871 he engaged to write exclusively for the New York 'Ledger.' He was ordained minister of the New Church (Swedenborgian), in 1876, but resigned from his charge at Mount Vernon, N. Y., owing to ill health. He is the author of: 'The Wickedest Man in New York' (1868); 'Great Senators of the United States Forty Years Ago' (1889); etc.

Dyer, Sidney, American poet and prose writer: b. Cambridge, N. Y., 11 Feb. 1814. He published a volume of poems entitled 'Voices of Nature' (1850); 'Songs and Ballads' (1857); 'Great Wonders in Little Things' (1871); 'Ocean Gardens and Palaces' (1877); 'Elmdale Lyceum' (1879); etc.; also 'Psalmist for the Use of Baptist Churches.'

Dyer, Thomas Henry, English historian: b. London 4 May 1804; d. Bath 30 Jan. 1888. He traveled and studied for years to prepare a 'History of Modern Europe' (1861); 'History of the City of Rome' (1865); and 'Ancient Athens' (1873); all monuments of learning and critical insight.

Dyer, Sir William Turner Thistleton, English botanist: b. Westminster, London, 28 July 1843. He was educated at Oxford, and beside holding other professional posts has been director of the Royal Botanic Gardens at Kew from 1885. He has edited: 'Flora Capensis'; and 'The Flora of Central Africa'; and is joint author of 'The Flora of Middlesex' (1869).

Dyersburg, Tenn., city, county-seat of Dyer County; on the north fork of the Deer River, navigable as far as Dyersburg; on the

DYER'S BROOM — DYES

Illinois C. R.R., and about 80 miles north-east of Memphis. The city owns its own electric light and waterworks plants; it contains a number of manufactories, chief of which are for flour, lumber, iron products, tobacco, and cotton and woolen goods. Pop. 3,800.

Dyer's Broom; Greenweed Woadwaxen. See DYE WEED.

Dyer's-moss, a lichen, called also archil or orchil. See ARCHIL.

Dyer's Rocket, Dyer's Weed, or Weld, a plant (*Reseda luteola*), of the mignonette family (*Capparidaceæ*). The plant is an erect herb, sparingly branched with long, narrow spikes of greenish-yellow flowers. The plant is extensively cultivated in Europe for the beautiful yellow dye it yields, and was originally grown in American gardens for the same purpose. It now grows wild in waste places, on Long Island, and in various spots near the eastern seaboard. It is known also as weld and woad.

Dyer's Weed. See DYER'S ROCKET.

Dyes, are employed in the various processes of dyeing, and when two or more are associated together, many different shades and colors are produced. The dyeing materials are procured from the mineral, animal, and vegetable kingdoms. Logwood is brought from Jamaica and from the eastern shores of the Bay of Campeachy, and on this account it is called Jamaica and Campeachy logwood. The former is much superior to the latter, owing to its having a larger percentage of coloring matter, and being of better quality, it brings a higher price. Fustic, or yellow wood, grows spontaneously in Brazil and in several of the West India Islands, where it attains to a great height and is used for producing yellow and in combination with logwood for producing various colors both on cotton and wool. There are two kinds of fustic, and to distinguish them, one is called young fustic. It is a shrub which grows principally in Italy and the south of France, where it is cultivated for the purpose of dyeing. When cut down it is stripped of its bark and broken into small pieces in which state it is met with in commerce. Quercitron is the inner bark of a tree which grows spontaneously in North America. Its dyeing properties were first made known to the public by Bancroft 1784. This gives a bright yellow orange color. Persian berries are the root of a plant growing in the Levant and south of France. They yield a bright yellow color, but are not largely used owing to the color being fugitive. Turmeric is principally brought from the East Indies. It is the root of a plant which is reduced to powder of a bright color although very fugitive, and is used for yellow, exclusively for cotton goods. Madder is a vegetable dye and rivals indigo as a dye drug not only for the beauty of the colors obtained from it, but also for the various shades it produces by combination of coloring matters. From this is made the fast turkey reds so well known. It is the root of a shrub and is cultivated in the Levant and several of the countries of Europe, including France and Holland. The East Indies also furnish a quantity. The madder not only furnishes a red but also a madder purple, orange, and brown. Archil coloring matter is procured from lichens growing on seaside rocks. The most esteemed is that which comes from the

Canary and Cape Verd Islands, but it is also found abundantly on the coasts of Sweden, Scotland, Ireland, and Wales. Camwood is another species of red-wood, imported from Sierra Leone. It produces a bright red color, which is permanent and for this reason has been largely used in the dyeing of wool, where especially fast colors were required. Barwood chemically the same as camwood, is brought also from Sierra Leone.

Indigo comes from plants growing in India, Africa, and America, called *Indigofera*, of which genus there are some 60 species. The coloring matter is found in the cellular tissue of the leaves as a secretion or juice, not however blue as we are accustomed to see indigo, but as a white substance, and is procured from the plant by fermentation. After the plant is fermented, the liquor is drawn and is agitated with paddles by the natives, until the indigo crystallizes out, when the clear liquor is drawn and indigo is taken out and pressed into blocks and dried. Latterly this has been done largely by machinery, which gives an indigo that is much purer than that made in the crude way by the natives. This indigo gives one of the most permanent dyes for standing light and for this purpose is greatly valued.

Sumac is diligently cultivated in Spain, Portugal, and some parts of Italy and Sicily. Sicily sumac is the best quality. This shrub grows to a height of about eight or ten feet. The shoots or shrubs are cut down every year close to the roots, and being dried are reduced to powder. Fine stems are often cut into small pieces and put in the powder. This is generally used when the metallic base or mordant is iron or tin and is therefore the bottom for blacks, reds, etc., for cotton dyeing. Sumac also grows largely in Virginia, and although having a very large proportion of tannin, owing to its leaving the cotton more or less stained, is not valued as highly as the Sicily and for this reason does not bring as high a price. See SUMAC.

Galls are certain species of oak excrescences, which originate in punctures made by insects for the purpose of depositing their eggs. Juice excretes from these punctures and gradually grows around the openings, varying in size from about a fourth of an inch to one inch in diameter. This substance from its resemblance to nuts and from its bitter taste is called gall-nuts. The best galls contain 26 per cent of tannin, and as they practically leave the cotton without being stained, are notwithstanding their much higher price, used where very light and bright shades are required.

Cochineal belongs to the animal kingdom, and is a small insect, largely found in Mexico, which gives a very bright crimson and scarlet. They feed on a cactus plant, which the natives cultivate around their buildings for that purpose. The insect attaches itself to the leaves of the plant and increases rapidly in number. During a season of seven months the insects are gathered three times, by brushing them off the leaves by the feather end of a quill into boiling hot water, in which they are kept for a few seconds. This not only kills them instantly but causes them to swell to twice their natural size. When taken out of the hot water, they are spread out and dried, and then packed for market. Some cultivators instead of hot water

DYES

use steam and others again place them in an oven or upon a hot plate. The difference in the cochineal is caused by these different means of killing the insects and heating them. The best sorts seem as if dusted with a white powder and are of a slate gray color. Carmine is made from cochineal.

Weld or wold is a vegetable extensively cultivated in France and many other parts of Europe, for the purpose of dyeing yellow and is found in commerce in small dried bundles; the more slender the stem the better is it considered for dyeing. Both seeds and stems are used. The coloring matter approaches very near to quercitron in chemical properties. Owing to the color being extremely fugitive, it has been largely abandoned as a dye.

The most recent discovery of importance is the extraction of color substances of great beauty from coal tar. The discovery dates back to 1826, but it was not until 1861 that they commenced to be extensively employed. Those first placed upon the market were aniline purple, violine, rosine, fuchsine or magenta, solferina, *bleu de Paris*, aniline green or emeraldine, etc. The tar consists of numerous classes of bodies of which aniline and benzole are two. Aniline is present in minute quantity, and for manufacturing purposes, means are generally resorted to for the conversion of the benzole of the tar into aniline. The coal tar colors in many instances are not only more brilliant in shade but easier of application. These are now so largely used that they are almost entirely displacing the dyes formerly employed. When first brought out, it was found that they were not able to resist the sunlight like many of the old dyes, but in recent years, great improvements have been made in this respect, and many of the coal tar dyes, as improved, are not only noted for beauty of shade but for fastness to light as well as being economical to use, and more certain in results. Some of the coal tar dyes are made in the United States, but at the present time, Germany is far ahead of all other countries in the manufacturing of these colors, and it has grown to an immense proportion; some of the German works employing as high as 5,000 people. Among the coal tar colors are the alizarines; alizarine red, blue, and yellow, which now almost entirely take the place of madder.

The so-called aniline reds are the salts of rosaniline from which we derive most aniline colors. Aniline red, under the name of fuchsine or magenta, is prepared by adding anhydrous bichloride of tin by degrees to aniline. The materials are constantly stirred during the operation to keep down the intensity of the action, and the result is that much heat is evolved. The mixture becomes pasty, then liquid and brown and as the temperature approaches the boiling point it becomes a dark, almost black liquid, which in very thin layers presents a rich, crimson color. This liquid is boiled for some time. Much water is added and the whole is reboiled so as to volatilize any free aniline and chloride of sodium (common salt) added until saturation, when fuchsine or magenta is precipitated as a golden green, semi-solid pitchy substance. Any resinous matter still remaining may be separated by digestion in benzole. This dye may also be obtained by acting upon aniline with nitrate of mercury. Fuchsine or magenta is

sparingly soluble in water and dissolves to some extent in alcohol and is insoluble in ether and naphtha. Roseine is most readily prepared on the commercial scale by adding two equivalents of lin-oxid of lead to a boiling solution of one equivalent of sulphate of aniline, and boiling the whole for a short time. On filtration, a rose-colored solution is obtained, then evaporated down to small bulk when some resin separates and the roseine is precipitated by soda or potash, and being collected on the filter can be washed and dried. This dye is readily soluble in alcohol and yields a very intense crimson color, which on being evaporated to dryness leaves a dark, metallic looking and brittle residue of roseine. It is soluble in water, but not in naphtha.

Aniline violet was the first aniline color manufactured. It was discovered by Perkin 1857. It is a sulphate of mauveine, known under the name of mauve, indisine, etc., and produced by oxidizing sulphate of aniline by bi-chromate of potassa. Tarry substances are formed at the same time, which are removed by dissolving them in hydrocarbons such as naphtha. This violet or purple is hardly soluble in water, but easily so in alcohol and sulphuric acid. The imperial purple of Girard and de Laire is obtained by heating together salt of rosaniline, magenta, for instance, with its own weight of aniline at a temperature of 350° F., for several hours. All the unaffected aniline is removed by weak acids and the purple remains. The regina purple of Nicholson is magenta heated to a temperature of from 390 to 420° F. The substance melts, evolves ammonia and a new color is produced. Blues can be obtained from these violets by washing them several times with diluted hydrochloric acid in order to dissolve all the aniline and magenta undecomposed and also a violet color. Aniline blues generally contain some violet and the violets some red shades in them. We find in the trade, blues with violet shades and violets with red or blue shades. Repeated washings will remove the violet, which is more soluble than the blue. But we must not consider the violets as simply mixtures of blue and red. The different shades are salts of rosaniline, in which hydrogen has been replaced by the radical phenyl. By varying the proportions of magenta and aniline and also the temperature various shades of violet are obtained. A true blue is prepared by adding to the mixture of magenta and aniline an organic acid or salt such as benzoic, acetic acid, or acetates. A blue thus obtained is called night blue, on account of its remaining blue under artificial light. Aniline greens are obtained by treating four parts of magenta by six of oil of vitriol, and two of water. Then 16 parts of aldehyd are added and the whole is kept at a temperature of boiling water until a few drops of the liquid give a blue color to a weak solution of sulphuric acid. The liquid is then poured into a solution of hyposulphite of soda and the green is "fixed." This green bath can be used directly for dyeing. It does not keep very long, but the color may be precipitated by tannin or acetate of soda. The insoluble compound is employed for calico printing and forming new dye baths. An iodide of ethyl green is produced by boiling Hoffman's violet with water and carbonate of soda. The liquor is treated by picric acid, a green precipitate is formed, which is washed, dried, and

sold in powder. It is soluble in alcohol, and, we believe, in water after trituration of the powder with two or three times of its weight of sal ammoniac. Aniline blacks and grays are developed on the cotton fibre itself. Lightfoot, who discovered aniline black, if black is a color, used a paste composed of chlorate of potassa and hydrochlorate of aniline, sulphate or chlorate of copper and starch enough to thicken. By the mutual oxidizing reaction of chlorate of potassa and chlorate of copper the aniline is oxidized to the degree of black. This paste was open to the objection of destroying metals. Further experiments made by Cordillot, Koechlin, and Lauth, led to these important facts, namely, that the hydrochlorate or nitrate of aniline are the only aniline salts which can produce a black, that the best aniline should be a mixture of aniline and toluidine, that the presence of copper is indispensable, and that a sulphide of copper, prepared by precipitation, will not corrode metals, and will gradually absorb the quantity of oxygen for its transformation into sulphate. If a tartrate or acetate of aniline is used, it is necessary to add to the mixture a certain quantity of sal ammoniac which will furnish the muriatic acid necessary for the transformation of the tartrate or acetate of aniline into a hydrochlorate. Aniline grays are obtained by diminishing the proportion of black producing substances of the above receipts by keeping as much free acid as in the primitive mixture for black. The maroon of M. de Laire was made by melting four parts of anhydrous hydrochlorate of aniline with one of dry aniline oil, the temperature slowly rises to 465° F. The operation is over when yellow vapors begin to appear and the mass is constantly transformed into brown. The color is soluble in water. Leucaniline brown is obtained by Koechlin in the following way: A salt of rosaniline is transformed into leucaniline by zinc powder. The leucaniline is separated from the zinc by alcohol, and this being evaporated, a tartrate of leucaniline may be formed, which is afterward transformed into brown by the oxidizing action of a mixture of sulphide of copper and chlorate of potassa.

F. H. PRESCOTT,

Expert in Dyes and Dyeing, Philadelphia.

Dyeweed, Dyer's Broom, Greenweed, or Woadwaxen, a plant, *Genista tinctoria*, the only American representative of the genus *Genista* of the pea family. The genus comprises about 80 species, natives of Europe, northern Asia, and Africa. The dyeweed is a low-branching shrubby weed, with a few yellow nearly sessile flowers. It was originally cultivated in New England gardens because of the green dye it produced, and escaping is found from Maine to eastern New York. Its medicinal value is small, although it is used in Russia as a specific for hydrophobia.

Dygasiński, dī-gās-ēn'skē, Adolf, Polish story writer: b. Russo-Polish government of Kiebyz 1839. His stories are remarkable for charming descriptions of scenery; among them are: 'On the Manor'; 'From Village, Field, and Forest' (1887); 'From City and Country' (1889). He has translated works by Max Müller, Tyndall, Mill, Lewes, and others.

Dyherrn, dī'härn, Baron George von, German poet and novelist: b. Glogau 1 Jan. 1848; d. Rothenburg, Silesia, 27 Dec. 1878. He wrote

many poems and tales of great merit; 'In the Still Hour' (1870) being a collection of his best verse; and 'From Society' (1880), and 'Heights and Depths' (1881), his ablest fictions.

Dying Declaration, a deposition made by one who is near to death. Such declarations are admitted as evidence both in England and Scotland.

Dying Gladiator, a famous work of ancient sculpture, representing the scene of a dying Gaul, and supposed to be one of a series of figures illustrating the incursion of the Gauls into Greece. The work is now preserved in the museum at Rome. It is not known whether the statue is an original or a copy, the work of Cresilas, a Grecian sculptor and contemporary of Phidias. The right arm of the statue has been restored, and it is not positively known by whom this restoration was made. The work has been credited to Michael Angelo.

Dyke. See DIKE.

Dykes, James Oswald, Scottish clergyman: b. Port Glasgow 14 May 1835. He entered the Presbyterian ministry in 1859, and in 1869 became minister of the Regent Square Church in London. Since 1888 he has been principal and Barbour professor in the Theological College of the Presbyterian Church of England. He is the author of: 'Beatitudes of the Kingdom' (1872); 'Laws of the Kingdom' (1873); 'Relations of the Kingdom' (1874); 'From Jerusalem to Antioch' (1874); 'Abraham, the Friend of God' (1877); 'Daily Prayers for the Household' (1881); 'Sermons' (1882); 'The Law of the Ten Words' (1884); 'The Gospel According to St. Paul' (1888); 'Plain Words on Great Themes' (1892).

Dykes, John Bacchus, English composer: b. Hull 10 March 1823; d. 22 Jan. 1876. He was graduated at Cambridge; ordained in 1847, and was appointed precentor of Durham Cathedral in 1849. In 1862 was presented to the vicarage of St. Oswald's in Durham. He was a joint-editor of 'Hymns Ancient and Modern,' and composed, besides many services and anthems, a number of hymn tunes, most of which are to be found in all English collections. Among these are: 'Nearer, My God, to Thee'; and 'Jesus, Lover of My Soul.'

Dynam'eter, an instrument for measuring the magnifying power of a telescope. This power is the ratio of the solar focal distance of the object glass to the focal distance of the eyepiece considered as a single lens; this being the same as the ratio of the diameter of the aperture of the telescope to the diameter of its image or disk formed beyond the eye piece, the object of the instrument is to measure the exact diameter of this image, which can be either projected on mother-of-pearl or measured by optical means.

Dynam'ic Theory, an hypothesis broached by Kant that all matter originated from the action of two mutually antagonistic forces—attraction and repulsion. All the predicates of these two forces are attributed by Kant to motion. As applied to heat, it is a theory or hypothesis—that now generally accepted as the correct one—which represents a heated body as being simply a body the particles of which are in a state of vibration. This vibratory movement increases as the body is still more heated, and diminishes

DYNAMIC UNITS — DYNAMO ELECTRIC MACHINERY

proportionately as it more or less rapidly cools. It is called also the mechanical theory of heat.

Dynamic Units. See UNITS.

Dynamics (Gr. "power"), that branch of theoretical mechanics which treats of forces. It is to be distinguished from "kinematics," which treats of the various kinds of motion that are possible in a given system, without discussing the forces to which these motions are due. See MECHANICS; HYDRO-DYNAMICS.

Dynamite (from Greek *dynamis*, power), an explosive invented by Nobel in 1866 and originally consisting of infusorial silica or diatomaceous silica, called "kieselguhr," and nitroglycerin. The kieselguhr, being composed of the siliceous skeletons of micro-organisms, is a very fine, dry powder with a great capacity for absorbing and holding liquids, and it will absorb and retain three times its own weight of nitroglycerin, so that the product contains 75 per cent by weight of the nitroglycerin, and is known as dynamite No. 1. Other grades are made by adding less nitroglycerin to the absorbent or dope. The name has now been extended to cover a great variety of pulverulent or plastic solid mixtures of which nitroglycerin is a component.

Dynamite is fired by means of a detonator or blasting cap. As the percentage of nitroglycerin in dynamites with inert bases is reduced, they become more difficult to detonate until when the nitroglycerin is below 30 per cent they can not, according to Howe, be detonated at all. This does not hold true for dynamites with active bases. Dynamite is usually put up in cylindrical brown paper wrappers, closed at each end and coated with paraffin. These cartridges or "sticks," as they are called, are usually from one to two inches in diameter and eight inches long, and they are packed for transportation in sawdust in wooden cases, there being 50 pounds in each case. The sticks are paraffined to prevent water reaching the dynamite, as this drives the nitroglycerin out of the kieselguhr dynamites and dissolves the nitrate of soda in the nitro-lignin dynamites, thereby diminishing their efficiency. Good dynamite is of about the consistency of fresh mold. It varies greatly in color according to the absorbent used, magnesia powder being snow white, kieselguhr dynamite No. 1 pearl gray to red, carbo-dynamite black, the lignin dynamites about the color of coarse brown sugar. There is usually a little sodium, calcium, or magnesium carbonate, mixed with the dope. Dynamite keeps as well as the nitroglycerin, from which it is made. It is safer than the latter, because it avoids the liquid state, while from its softness it will bear blows better. Its sensitiveness to blows increases very rapidly with the temperature, so that, according to Eissler, "at 350° F., the fall upon it of a dime will explode it." At ordinary temperatures it may be exploded by firing musket balls into the mass. The firing point of dynamite is about 180° C. (356° F.), and at this temperature it either burns or explodes. If free from all pressure, jar, vibration, or force of any kind, it burns; otherwise, it explodes. If a thin layer be placed on a plate of tin and heated over a burner the nitroglycerin volatilizes or takes fire. If the layer is of any considerable depth, say over a quarter of an inch, it explodes. This is

a dangerous experiment. When heated to any temperature less than this, it is exploded by a detonator, blow, jar, or vibration with an ease dependent on the temperature and time of exposure. When ignited in comparatively small quantities dynamite simply burns away fiercely, but with moderate and larger amounts ignition causes explosion. To safely destroy dynamite it should be treated with a solution or emulsion of an alkaline sulphide such as the spent lime from gas works. High temperatures, much below the ignition or explosion temperature, cause the nitroglycerin to exude, or in technical terms, "they will make the powder leak," hence a dynamite should be made to resist exudation at the highest temperature to which it may be exposed.

Dynamite freezes at about 40° F., and remains frozen at temperatures considerably exceeding this. If solidly frozen it cannot be detonated except with great difficulty and uncertainty, but if loose and pulverulent it may be detonated, though the efficiency is much diminished, hence when frozen it is practically useless as a blasting agent, and must be thawed or "tempered" for use. This operation requires great care and the instructions issued with each case should be closely followed. Many persons suppose that since cartridges of unfrozen dynamite may sometimes be set on fire and burned without exploding, it is safe to warm it upon a shovel, or in an oven, or to boil it over a stove, or in various other ways which usually lead to a verdict of "accidental death." It cannot be too strongly impressed upon the minds of those handling it that if dynamite or other nitroglycerin preparations are gradually warmed up to a temperature approaching their explosion temperatures they become extremely sensitive to the least shock or blow, and once that point is reached they do not simply ignite, but they explode with great violence, and further that, owing to the poor conductivity of the mass, a portion of it may become raised to this temperature and explode the whole.

Dynamite has a specific gravity of 1.5 to 1.6. In his earlier experiments with absorbents Nobel in 1863 placed gunpowder in a zinc case and filled the interstitial spaces with nitroglycerin. This might be called a dynamite with an active base, but that the nitroglycerin was greatly in excess of that existing in dynamites. See EXPLOSIVES; NITROGLYCERIN; POWDER.

CHARLES E. MUNROE,
The Columbian University, Washington, D. C.

Dynamo Electric Machinery, machinery which transforms mechanical energy into electrical energy, or which converts electrical energy into mechanical energy. A dynamo electric machine consists of two distinct parts, one of which is stationary, the other part being rotative. When the rotary element is driven by an external force and the machine develops electrical energy, it is termed a generator or a dynamo. If electrical energy be supplied to the machine and the revolving element develops mechanical energy, the machine is termed a motor. Special types of machines in which both dynamo and motor action are present are treated later.

The operation of dynamos is due to the principle of electro-magnetic induction discovered by Michael Faraday in the year 1831. He noticed that when a loop of wire of several turns was

DYNAMO ELECTRIC MACHINERY

revolved between the poles of an electro-magnet a flow of electric current took place in the wires of the loop. The rotation of the loop was about an axis perpendicular to the lines of force emanating from the pole.

The term electromotive force represents the pressure which forces an electric current through a circuit. In a dynamo its magnitude depends upon the rate of cutting of magnetic lines of force. These lines of force are imaginary and indicate the magnitude and direction of the force of a magnetic field. To continuously produce an electromotive force, continued cutting of lines of force is essential. The magnitude of the electromotive force induced in a loop which is revolving in a magnetic field is directly proportional to the rapidity with which the loop is revolved, to the number of turns of wire in the loop, and to the strength of the magnetic field. The direction of the E. M. F. induced in a loop depends upon the position of the loop relative to the poles. When one of the wires of a loop passes one pole, an E. M. F. is induced in the wire which tends to send a current in one direction; this direction changing as the wire cuts the flux at the other pole. Opposite sides of the loop pass poles of opposite polarity simultaneously, a current therefore tends to flow in one direction around the loop. The direction of the E. M. F. in the loop changes as the wires pass from a north to a south pole. When the loop is connected to two slip rings, as illustrated in Fig. 1,

FIG. 1.

and revolved, an alternating current may be obtained by attaching to the slip rings suitable collecting devices. The substitution of a two-part commutator, Fig. 2, for the slip rings will rectify the current and produce a direct current, or a current which flows continuously in one direction.

FIG. 2.

Dynamo electric machines are divided into two distinct classes, those which generate a

direct current and those which generate an alternating current. It is customary, with a few exceptions, to term the part of a machine in whose coils the E. M. F. is generated the armature, and the parts that produce the flux, the field magnets. Dynamo electric machines are further classified as to their mechanical operation into machines in which: (a) The armature revolves and the field magnets are stationary; (b) The field magnets revolve and the armature is stationary; and (c) The field and armature coils are stationary and iron core revolves. It is obvious from previous mention that a dynamo electric machine may generate either a direct or an alternating current depending upon whether it is supplied with a commutator or with slip rings. Machines termed rotary converters possess both a commutator and slip rings, their function being to convert alternating into direct current or *vice versa*. If the machine be driven by an external force, either direct or alternating current may be obtained by making the proper brush connections. The rotary converter when operated in this manner is termed a double-current generator. As the construction of the armatures of direct current machines, rotary converters, and a large number of alternating current machines is similar with the exception of their commutators or slip rings, the construction of the armature of a direct current machine will be given in detail.

Direct Current Armatures.—A direct current rotative armature consists essentially of three parts, an iron core mounted upon a shaft, a number of conductors wound upon the surface of the core or embedded in slots near the surface, and a commutator.

Core.—The object of the core is to facilitate the passage of lines of force from one pole of the field magnet to another. If this core were not present fewer lines of force would pass through the armature, and this would tend to decrease the E. M. F. generated by the machine. For equal magnetizing forces a sample of iron may carry 2,500 times the number of lines of force that would be carried if air were substituted for it.

The periphery of the armature core of large machines is usually slotted longitudinally, the purpose of which is to contain the conductors. This also tends to decrease the air space, termed the air gap, between the core and the pole faces, a thing which is very desirable.

The core is composed of iron disks punched from sheets. These disks are punched out whole for small machines, or are made in segments, the junctions of which are staggered in large machines. The disks in machines of large capacity are mounted upon a form of proper dimensions, which in turn is fastened to a spider and keyed to the shaft. The punchings are assembled with their planes perpendicular to the axis of rotation. The reason for using disks instead of a solid casting is that the iron core is equivalent to a conductor revolving in a field. Currents, termed Foucault currents, flow through the iron in the direction of the axis if the disks are not properly insulated. This current unduly heats the armature and is therefore undesirable.

Armature Windings.—The wires distributed over the periphery of the core of an armature constitute the generating part of a direct current machine. Armatures in which the windings are only upon the periphery are termed drum arma-

DYNAMO ELECTRIC MACHINERY

tures. When the core of the armature is in the form of a ring and the wires are wound in and out around the ring the armature is called a ring armature. Drum armatures are in use commercially to a greater extent than ring armatures particularly in the case of large machines. In the drum armature a greater portion of the winding is active in producing an electromotive force than in the ring armature. The ring armature has considerable wire upon the inner face of the ring in which very little electromotive force is induced.

The length of active conductor connected in series on an armature determines the magnitude of the electromotive force generated by a given magnetic field. In machines of large magnitude two volts or more are generated per foot of active conductor.

Many forms of armature winding are in vogue. The designing engineer is often called upon to design a machine of given capacity which will generate a certain pressure at a definite speed. To do this he must place sufficient wire in series to produce the required E. M. F. and this wire must be of sufficient cross-section to carry the current it will be called upon to deliver. To meet these conditions and still have an armature which is not abnormal in size often results in a very complicated series multiple winding. Machines of large capacity usually have more than one pair of poles and have brushes between successive poles around the commutator. These serve to conduct the current to the main circuit.

An economical method of winding drum armatures consists in the employment of formed coils. These coils are wound upon a collapsible form of proper dimensions and after being thoroughly insulated and shellacked are removed from the form. They are then inserted in the slots of the armature core. The distance between the two halves of the loop is nearly equal to the distance between the centres of two poles of opposite polarity. The terminals of the loop are connected to two adjacent commutator segments. The next loop is placed in slots and similarly connected, care being taken to connect the two coils in series to a common commutator segment. By this method the current tends to flow in one continuous direction. Many modifications are made to this form of winding but the principle of connecting the coils so that their E. M. F.'s will be cumulative is common for all machines. Some machines have two or more separate windings upon the same core.

Commutators.—A commutator consists of an assemblage of drop forgings, or castings of copper called segments, Fig. 3, which are thoroughly insulated from each other. These segments are assembled around a tube. The tube is threaded at both ends to receive nuts to hold the segments together. Mica is usually employed to insulate the segments from each other, from the nuts, and from the tube. In addition to its high insulating properties, mica possesses the advantage that it wears under the brushes at about the same rate that copper does. This maintains a smooth surface at all times upon the surface of the commutator. The maximum voltage between adjoining segments is seldom allowed to exceed 20 volts. Assuming that the voltage is uniformly distributed, a 240-volt machine with a closed winding would therefore have 12 bars between adjoining brushes, or for a 2-pole machine 24 commutator segments. In Fig. 3 the perpen-

dicular projection, "P," of the commutator segment protects the coils on the armature, and is made to receive the extremities of the coils of the armature windings. The wires in some cases are fastened to the lugs, "P," with set-screws and then soldered. The commutator complete is keyed to the armature shaft.

FIG. 3.

Brushes.—Carbon and copper are the two materials usually selected for brushes; carbon for high potential machines and copper for low potential machines. When a coil is entering commutation it has a current of electricity flowing in it. The direction of this current changes when the coil is commutated. The current flowing in the coil before commutation tends to keep up because of its self-induction. In the time it takes a strip of insulation to pass under the brush, the current flow in the coil must be stopped, and a current of equal value started in the opposite direction. Both operations may be done by counter E. M. F., or the current flow may be stopped by a high resistance and started by fringe flux. The transition resistance of brush to commutator usually causes a fall in the potential of about one volt for every brush. The pressure of the brushes against the commutator varies, the average value is about $1\frac{1}{2}$ pounds to the square inch. The necessary area of rubbing surface of carbon brushes is one square inch for 40 amperes, and copper brushes permit of 200 amperes for the same cross-section.

Field Magnets and Field Frame.—The field magnets produce the magnetic flux in which the armature rotates. The flux is created by a current of electricity traversing many turns of wire which are wound upon iron cores. A north or a south pole is produced, depending upon the direction in which the current flows through the coil. The coils on the field magnets are connected in series and so arranged that the polarity changes consecutively from pole to pole. Modifications are sometimes made to this form of winding when it is desirable to produce a machine which will supply a three-wire circuit. The machine is then designed as a four-pole machine having two adjoining north poles and two south poles similarly placed.

The laws governing the flux of magnetic lines are similar to the laws of current flow. The flux which will flow in a magnetic circuit is equal to the magnetizing force (termed the magnetomotive force) divided by the reluctance of the circuit.

$$\text{Flux} = \frac{\text{Magnetomotive Force}}{\text{Reluctance}}$$

The reluctance of a magnetic circuit is a property analogous to the resistance of an electric circuit. To obtain a maximum flux through

DYNAMO ELECTRIC MACHINERY

an armature with a given magnetomotive force it is necessary to reduce the reluctance of the magnetic circuit to a minimum.

In the design of a generator it is often convenient to first design the armature and then obtain the magnitude of the flux which must be generated by the field magnets. Having selected a given material for a field frame, a given air gap, a given length and cross-section of magnetic circuit, the total reluctance of the circuit is determined. The reluctance varies directly as the length of the circuit, directly as the reluctivity of the material and inversely as the cross-section. Knowing the total flux and the reluctance of the circuit, the magnetomotive force is determined, and this quantity divided by 1.257 gives the number of ampere turns necessary to produce the magnetic field.

Field Coil Connections.—Dynamos and motors may be shunt wound, series wound or compound wound. In the series dynamo the

nected in series with the armature alone, its connection depending upon the percentage of compounding required. By compounding a machine the strength of the magnetic field is increased in proportion to the current generated by the machine, the percentage depending upon the number of turns in the compound coil and as to the way in which it is introduced in the circuit. If a shunt machine be not compounded, the potential falls with an increase above normal of the generator output.

Methods of Excitation.—A dynamo electric machine may be separately excited or self-excited. When self-excited, the machine builds up slowly to its normal potential, and when disconnected from the main circuit the field magnets gradually discharge themselves as the speed of the machine decreases. The polarity of a self-excited machine may become reversed or the machine may fail to generate sufficient pressure to magnetize the field magnets. Both of these conditions are serious. When the field coils of the separately excited machine are connected to

armature circuit, the field circuit, and the external circuit are all in series. Series motors are used for traction purposes as they give a large starting torque. Series dynamos are used for arc lighting, as they generate a constant current. Shunt wound machines have their field circuit, their armature circuit, and their external circuit connected in multiple. A shunt machine is designed to generate a constant potential, or when operated as a motor to run on constant potential. The field coils of a generator may be separately excited, in which case an external source furnishes the current for exciting the coils. Separately excited machines are usually employed in large power houses where it is desirable to have a flexible system, which means the ability to vary the pressure sent out on the line at any instant of time. In the United States where 8,000 horsepower generators are now in successful operation, each machine is taken as a unit and the control of the exciting current for the fields is a very important factor. The machines are separately excited; the exciting dynamo being supplemented by a bank of storage batteries as an emergency. A compound winding consists of an additional winding upon the field, this winding being connected in series with the line. It may be placed in series with the armature and the field connected in multiple, or it may be con-

FIG. 4.

an external circuit they definitely assume their proper polarity and there is no possibility of this polarity becoming reversed. In addition to this the field magnets of the separately excited machine rapidly build up to the point where the machine generates its normal potential. The disadvantage of this machine is that when disconnected from its external exciting source its fields must be instantly discharged through a bank of lamps or some other consuming device, as there is danger of the fields discharging through the insulation of the machine. A method devised by Mr. Donshea embodies the advantages of both the separately excited machine and the self-excited machine and lacks their disadvantages. The method consists of the operation of a specially devised three-part switch. Fig. 4. The single switches A and B are closed, connecting the field magnets of the generator to the source of separate excitation. The field magnets quickly

DYNAMO ELECTRIC MACHINERY

and definitely assume their proper polarity. The switch C is closed when the machine is generating the proper potential. The machine then returns power to the circuit which may be the buss bars of the switchboard. When the switch C is closed a catch on the handle engages the switch B at the point P. When it is desired to disconnect the machine from the circuit, the handle M is engaged which carries switches B and C out together. The machine is then equivalent to a self-exciting machine and the fields gradually disappear as the machine slows down.

Speed Conditions.—Consider a motor operating under normal conditions from an external supply of E. M. F. The armature of this motor is rotating in a magnetic field and therefore has an E. M. F. induced in its armature windings. The direction of this E. M. F. is such as to tend to send a current of electricity in the opposite direction to that passing through the armature under the influence of the external supply. This E. M. F. is termed the counter electromotive force. The pressure of the external source remains approximately constant, and the counter E. M. F. varies with the armature speed. As the motor is loaded its speed tends to decrease. This decrease diminishes the counter E. M. F., and a larger current is permitted to pass through the machine. The difference between the impressed and the counter E. M. F.'s divided by the resistance of the armature gives the magnitude of the armature current. It is obvious that a very large current would flow through a stationary armature of low resistance, if the armature

an induction motor, and which made possible the economic long-distance transmission of power. This motor had two great advantages over the direct current motor, in that it possessed no commutator or brushes to be cared for, and it could be operated by alternating currents. It possessed the disadvantage that there was no ready means of regulating its speed. There is considerable difference between the construction of an induction motor and that of a direct current motor. Induction motors have a revolving element whose laminations are somewhat similar to those of the armature of a direct current motor, as they fulfil the same function. The movable part of an induction motor is called the rotor, and the stationary element surrounding the rotor is called the stator. In a common form of rotor, called the squirrel cage, the inductors are insulated and embedded diagonally in slots around the periphery, and at each end of the rotor these inductors are connected together to a common ring. The coils of the stator which create the magnetic field are so wound that several out-of-phase alternating currents have their magnetic actions superimposed upon each other and thus produce a field which continually shifts. This field is termed a rotating field. The stator field induces currents in the rotor which react upon the field and cause the rotor to revolve. The motion of the rotor is not synchronous with respect to the field of the stator, but slower. The ratio of the deficit of the rotor speed to the speed of the stator field is termed the slip of the induction motor.

Safety Devices.—There are many large power houses in the United States continuously generating 40,000 horsepower and over. The units employed in these power houses range as high as 8,000 horsepower. Since the introduction of the steam turbine there has developed a tendency to increase the size of these units to 12,000 horsepower. One of these units would generate sufficient power to replace all of the electrical power developed in Switzerland. New York has under course of development and in operation power houses whose output will aggregate 750,000 electrical horsepower when completed. When the new power houses at Niagara are in operation, almost 500,000 E.H.P. will be developed. The management of many of these power houses claim to have given continuous service since first installed. They have been able to give this service to the public by having duplicate pieces of apparatus in many cases and by protecting their entire system from excessive overload and strain, and from the elements by suitable protecting devices.

Fuses.—The simplest protecting device consists of a fuse. Fuses are made in many forms. The link fuse is made in strips, or as wire of an alloy possessing a low melting point. When the current strength exceeds a certain limit, the heat developed in the fuse by the pressure overcoming the resistance of the fuse is sufficient to melt it and interrupt the service.

Circuit Breakers.—Where heavy currents have to be interrupted an electromagnetic device termed a circuit breaker is employed. This device consists of an electromagnet of low resistance placed in series with the circuit. When the current in the circuit exceeds the normal amount, the magnet attracts an armature which releases a catch, and allows a spring to open the switch governing the circuit.

were connected directly to an ordinary commercial lighting or power circuit. To prevent this large current flow, devices called starting boxes are employed for starting motors. The function of a starting box is to first complete the exciting circuit of the field magnets and then to gradually cause a rise of the impressed potential upon the armature terminals, from zero to that of the supply circuit. The latter is accomplished by gradually diminishing resistance which is in series with the armature until the speed of the machine is almost normal, when all the resistance is entirely removed.

Induction Motors.—In the year 1888, Mr. Nikola Tesla, of New York, introduced a dynamo electric machine, which is now termed

DYNAMO ELECTRIC MACHINERY

Time Limit Relays.—Generators are liable to be subjected to an excessive overload for a short period of time. This sudden variation in load often occurs in the operation of railroad trains, mining machinery, mills, and machines of a similar nature. It would be very inconvenient to have breakers open the circuit whenever these sudden variations in load occur, especially as the generators are usually designed to stand an overload of 25 per cent for half an hour, and an overload of 50 per cent for one minute. The time limit relay performs the same function that a circuit breaker does, namely, opens the circuit whenever an excessive overload occurs. There is this difference, however, between the two devices: the operation of a circuit breaker is practically instantaneous, whereas a time limit relay has a time element associated with it. This time element is adjustable and may be arranged so that the circuit will be opened after a definite interval of time following the overload. In one form the magnetic action of the relay is opposed by a bellows, or a dash-pot, which contains air. When the relay begins to operate a solenoid draws a plunger down, which in turn compresses air in a receiver. The force exerted by the compressed air is lessened by leakage. When the limit is reached, say five seconds, the circuit is automatically opened.

Reverse Current Relay.—If a generator become disabled and is unable to develop a pressure equivalent to that generated by machines linked in with it, there is a possibility of a large cross-current flow into the disabled generator from the other machines. To prevent power returning into such a machine a device termed a reverse current relay is employed which automatically cuts out the machine from the service.

Lightning Arresters.—While there is nothing that will protect electrical apparatus from a direct stroke of lightning, still means have been provided to protect apparatus from discharges occurring in its vicinity. It is customary to protect transmission lines by installing ground wires at repeated intervals along their course. One method much in use is to run a wire from the top of the transmission pole to the ground. Such wires are installed every few poles. Charges, due to lightning occurring in the vicinity of the pole line, discharge themselves over these wires into the ground in preference to traveling along the transmission line, entering the station, and destroying the generating or the receiving apparatus. As lightning frequently oscillates with a very high frequency, a few turns in the transmission wire is sufficient to impede the discharge of the lightning and make it tend to seek another path. An auxiliary path to the ground is often provided, this path being composed of a number of spark gaps in series. These gaps are traversed very easily by the high potential of the lightning and are sufficiently far apart to prevent the line potential from discharging to ground. A device of this character is termed a lightning arrester. When the lightning has broken down the gaps of a lightning arrester, there is a tendency for the line potential to continue the discharge through this path. To prevent this, one half of the gaps are shunted by a reactive coil. The induction of this coil is so adjusted that the lightning will jump the gaps, shunting the coil in preference to flowing through the coil. The line potential, however, of much lower frequency and lower

potential than the lightning, passes through the coil in preference to jumping the gaps. The result of this current flowing through the coil is to produce a magnetic field of sufficient intensity to extinguish the arc across the gaps and to restore the line to normal conditions of operation.

Central Station Economics.—It is desirable to reduce the initial cost of the production of electric power to a minimum wherever fuel is expensive and natural sources of energy, such as water-power, are absent. Such conditions are met with in many of our large cities. This reduction is accomplished by installing engines and generators of the highest efficiency, and by employing all methods which will tend to increase the efficiency of the plant. One of these methods is to directly connect the armature of the generator to the shaft of the engine. This eliminates the friction losses which would occur if belting were employed, but necessitates good speed regulation, as the pressure of a generator is directly proportional to the speed with which it rotates. It is essential for good service that the speed be regulated to within 1 per cent, otherwise lights will flicker and their use will be objectionable. Sometimes in large electric lighting systems the voltage of a given part of the system may vary as much as 5 per cent, but this variation is not continuous, and is due more to the local loading of the mains and not to the generator at the central station.

Throughout the western part of the United States much use is made of water-power for generating purposes. Power houses are situated in the bottom of ravines and are operating under heads of water as great as 2,000 feet. The famous Colgate plant on the Yuba River has transmitted power 253 miles, the longest electric power transmission in the world. Although the cost of water is small compared with the cost of coal, still the cost of electric power generated from water is not much cheaper than when generated from coal. This is due to the fact that the initial investment in a water-power plant is much greater than in a steam plant of the same magnitude. Much capital must be spent in the construction of expensive dams, waterways, and pipe lines.

Direct Current Transformers.—One of the greatest advantages of electrical energy over other forms of energy is its flexibility. It may be generated in one place, and its pressure may

DYNAMOMETER—DYSENTERY

be transformed from a low voltage to a high voltage. The electrical energy in this form may be transmitted to a distant place where the reverse transforming process occurs. The higher the voltage under which power is transmitted, the smaller need be the cross-section of the transmission line. A stationary static transformer operating upon the principle of induction, is all that is essential to transform alternating currents, but with direct current transformation, it is necessary to employ rotating apparatus. It is not considered good engineering practice in the United States to use direct current for transmission purposes. Alternating current is used for this purpose and direct current is employed for distribution. Several machines have been designed which will transform direct current from one voltage to another voltage. They are termed motor-generators, dynamotors, and boosters. A motor-generator consists of a motor and a generator coupled together upon one shaft. The speed of the motor may be varied, which will correspondingly alter the voltage generated by the dynamo. A dynamotor consists of two armature windings upon the same core, rotating in one field. The armature has two commutators, one at each end of the shaft. This type of machine has practically no armature reaction and therefore has a small tendency toward sparking. The main disadvantage of this machine is that it is impossible to vary the field strength for purposes of regulation without correspondingly altering the voltage of the dynamo. A booster is a machine used extensively to raise the potential of railway feeders. Its armature is usually placed in series with the feeder and driven by some external source of energy. When its field coils are in series with the line, it is termed a series booster, and when the field coils are connected in multiple it is called a shunt booster. The capacity in watts of a booster is determined by the product of the feeder current into the maximum change of voltage which it causes. See also **ELECTRICITY** and kindred articles.

SYDNEY W. ASHE,

Polytechnic Institute of Brooklyn.

Dynamometer (Gr. "power-measurer"), an appliance for determining the force required to overcome a given resistance. It is constructed in the most varied forms, according to the nature of the problem to be solved. A tension-dynamometer, such as might be used for measuring the force required to tow a vessel, is usually constructed on the principle of the steel balance, the tension that it is to measure being caused to compress (or elongate) a steel spring, whose deformation is observed by means of an index and scale, or continuously recorded by means of a pencil upon a drum that is revolved by clock-work. Dynamometers for measuring the torsional force transmitted by a shaft are commonly made by cutting the shaft in two, and uniting the separate but adjacent ends by means of a coupling which permits one of the ends of the shaft to rotate somewhat, relatively to the other end, the relative motion being opposed by a spring in the coupling, whose extension measures the twist that is communicated through the coupling. The commoner forms of dynamometer measure force, and not power. To determine the horsepower that a given apparatus is transmitting, it is necessary to know the velocity with

which the resistance is overcome, as well as the magnitude of the resistance itself. In ordinary work the velocity is observed separately, and the horsepower inferred by computation; but instruments known as "integrating dynamometers" are used to a limited extent, the computation being performed by these instruments automatically, somewhat as the area of a curve is computed by the planimeter.

Dynamotor. See **MOTORS AND DYNAMOS**.

Dyne, *din* (Gr. "power"), the unit of force in the centimetre-gram-second system of units. It is defined as the force that must be exerted upon a gram of matter for one second, in order to give it a velocity of one centimetre per second. The attractive force that the earth exerts upon a milligram of matter is somewhat different in different latitudes, but it may be said, for the sake of illustrating the order of magnitude of the dyne, to be about 1.02 dynes. For many purposes this is too small a unit for convenience, and a larger unit, called a "megadyne" and defined as equal to 1,000,000 dynes, is often used in its place. To the same degree of approximation as before, the attraction that the earth exerts upon a kilogram of matter may be said to be equal to 1.02 megadynes. See **UNITS**.

Dynograph, an apparatus used in modern railroading for testing the inequalities in the road-bed or track. It consists of a recording instrument mounted in a car and geared to the wheels thereof. An automatic pencil records the slightest roughness or inequalities, and locates them. The dynograph is in use on all the great railroads.

Dy'renforth, Robert St. George, American patent lawyer: b. Chicago 17 Oct. 1844. His early education was in the public school, but he finished it in Prussia where he began studying in 1857, and was graduated at Breslau in 1861. He took a degree in the Karlsruhe Polytechnic School after a course in mechanical engineering; he also was graduated at Heidelberg in mathematics, physics, and chemistry (1866-9). During the Civil War he served on the staffs of Gens. Rosecrans, Copeland, and Dodge. He entered the United States Patent Office 1871, resigned on Cleveland's election in 1885, and has since practised as a patent and corporation lawyer.

Dyrrhachium, *dīr-rā'kī-um*. See **DURAZZO**.

Dysart, *dī-zärt*, Scotland, a seaport in the county of Fife, on the Firth of Forth; 12 miles northeast of Edinburgh. Dysart possessed great importance in the 15th century, and was famous for collieries and salt-works. The trade is still of importance. Pop. 3,022.

Dyscrasia, *dis-krā'sī-a*, or **Dyscrasy**, in pathology, a generally faulty condition of the body; an unequal mixture of elements in the blood or nervous juice; a distemperature, when some humor or quality abounds in the human system.

Dys'entery, a general term connoting a series of diseased conditions of the large intestine or colon (q.v.) These may be of an infectious, nervous, or chronic inflammatory origin. At the present time, it is becoming recognized that most cases of dysentery are due to some form of micro-organism, and, within

DYSLYSIN — DYSPEPSIA

recent years, a bacillus has been described by a Japanese observer, Shiga, which is thought to be responsible for a number of the cases of dysentery, both in adults and in children. Certain mild cases of dysentery have been shown to be dependent upon the pernicious activities of certain bacteria belonging to the genus *Proteus*. And it has now been known for a long time that a certain lowly organized animal form, the *Amœba*, can induce a peculiar type of dysentery known as amœbic dysentery.

The general mode of onset of dysentery of the non-amœbic form, that is particularly epidemic dysentery, is rapid, with diarrhœa following perhaps a mild constipation or alternating constipation and diarrhœa with a mucous or serous discharge. Symptoms of indigestion frequently precede the attack, and it is characteristic that diarrhœa is accompanied with much wind. The fecal movements are large, loose, very fetid and usually mixed with blood and mucus. The movements are accompanied with great pain of a colicky or gripy nature. Tenesmus, or straining, is a very frequent symptom. There is usually much general pain, some rise in temperature, loss of appetite, nausea, restlessness, and irritability. In favorable cases formed feces commence to reappear in the stools and there is disappearance of the griping and straining. In the patients in whom the disease becomes more acute, the passages become looser, watery, slimy, and of a dark red color. The odor is mawkish, and in later stages may even become putrid. The fluid that is passed consists largely of an albuminous serum with epithelium blood cells, pus cells, tissue fibres, and small sloughs, and if the disease becomes even more pronounced the stools become dark brown in color, with sloughs and blood clots, and have a distinctly gangrenous odor. These sloughs from the intestine usually indicate an extremely severe form of the disease and oftentimes the patient dies with completely relaxed anus, with subnormal temperature, shrunken features, and in complete collapse.

Amœbic dysentery is, as a rule, a more gradual form of disease. It is extremely intermittent in its course and much protracted, running on sometimes months and even years. It very frequently begins with painless diarrhœa, alternating with constipation; the stools being loose and yellowish, containing much mucus and a little blood. The patient commences to lose flesh, becomes weak and anæmic, and the complication of abscess of the liver is extremely common. Chronic dysentery is a form of chronic colitis and can be found under that head. The treatment of dysentery consists in rigid hygiene and skilled medical attendance. See AMŒBA; CHOLERA; COLITIS; ENTERITIS; ENTEROCLYSIS; INTESTINES; PARASITES.

Dys'lysin (Gr. "hard to dissolve"), an amorphous, resinous substance, having the formula $C_{24}H_{30}O_8$, and obtained from cholic acid by heating to about 600° F., or by prolonged boiling with dilute hydrochloric or sulphuric acid. It is soluble in ether, slightly soluble in boiling alcohol, and insoluble in water; and it is reconverted into cholic acid by boiling with an alcoholic solution of caustic potash. It is occasionally found in feces.

Dysmenorrhœa, dīs-mēn-ō-rē'a, painful menstruation. To constitute dysmenorrhœa, the

pain accompanying menstruation should be very distinct and persistent. Inasmuch as dysmenorrhœa is found accompanying a vast variety of abnormal conditions of the uterus and ovaries, it seems not improbable that this affection has no settled pathology, but may be associated with almost any abnormal condition within the generative apparatus of women. A vast variety of forms of dysmenorrhœa have been described, the most important of which seems to be that of obstructive dysmenorrhœa, or a mechanical form supposed to be due to some interference in the escape of the menstrual fluid. Those who suffer from dysmenorrhœa are apt to be anæmic, which anæmia in itself may be a sufficient cause for the disease. They are apt to be extremely nervous and run down. Treatment, therefore, should be directed to the supplying of the deficiency of the iron in the blood to overcome the anæmia, and the use of cod liver oil and other reconstructives. Of the various drugs that have been used for the treatment of dysmenorrhœa those that relax muscular fibres and arterial walls seem to give the best results. This is true of a number of the newer synthetic drugs that have been employed very widely of late. As no two cases of dysmenorrhœa are due to precisely the same cause, general directions for treatment would be out of place in a work of this character, but rest in bed, free movements of the bowels, and hot water in the form of hot-water bags, or hot-water enemata, are very useful household remedies. See MENSTRUATION; OVARY; WOMB.

Dyspep'sia is that combination of symptoms that result from interference with the proper digestion of food in the stomach. Because of the taking of too much food, or unsuitable food, the mucous membrane of the stomach becomes irritated and there is set up an acute or subacute gastric catarrhal condition which prevents the proper digestion of the food. This food is apt to ferment and to decompose, and as a result, the familiar picture of acute dyspepsia may arise. In mild cases there may be nothing more than an uncomfortable feeling in the stomach, with a certain amount of depression, headache, loss of appetite and perhaps belching of wind and occasionally vomiting. There may also be accompanying intestinal symptoms, such as diarrhœa and colic, particularly in children. There may be only the familiar heartburn, due to the over-dilatation of the stomach, from the excessive gases of fermentation or putrefaction. In the more severe cases, those that last over a day or two, the symptoms enumerated may be much more intense. The distress may be marked, and the general constitutional symptoms more evident. Vomiting, loss of appetite and mental depression are much more pronounced. This is particularly true of acute gastritis, due to the excessive use of alcohol.

Very frequently, from continued errors in diet, the acute or subacute condition may become chronic so that there is a continual indigestion. Here the symptoms persist for an indefinite period, the appetite is very apt to be variable, although at times very good. Oppression after eating, which may amount to actual pain, is one of the most constant symptoms. Occasionally the pain may be pronounced when the stomach is empty. Heartburn is frequent, if not constant, the stomach is painful on pressure, the

DYSPHAGIA — DZUNGARIA

tongue is coated, there is bad taste in the mouth, there are changes in the amount of salivary secretion. Frequent belching of gas is a very common accompaniment of chronic dyspepsia, particularly of the flatulent variety. Here also the intestines suffer from distention. Nausea is more pronounced, particularly in the morning hours, and vomiting is common in the morning. Constipation is usually present, although diarrhoea may alternate with constipation, and mental depression is almost characteristic. The treatment of acute and chronic dyspepsias constitutes one of the most difficult problems in modern medicine, particularly as few patients are willing to undergo the ordeals of a rigid dietary regimen. Most cases of dyspepsia can be cured if the diet is looked after, although each case needs careful consideration from the standpoint of causation. Proper eating and proper amounts of food are the two most important features in the treatment. Most people eat too fast, and eat too much. If the food is taken slowly, observing the old-fashioned rules of counting between mouthfuls and small amounts are taken, many patients suffering from indigestion can treat themselves with success. As to the details of the dietary and as to the medicinal treatment of the condition, medical advice is absolutely necessary. One of the most pernicious of all practices in the treatment of dyspepsia is the taking of many of the patent medicines which are so blatantly advertised in the religious and lay press. As most of these so-called tonics are hardly more than alcoholic beverages, it is evident that their use is not unattended with a great deal of danger. The treatment of the constipation that is so frequent an accompaniment of chronic dyspepsia by means of the many patent pills, powders, teas, and liquids is positively suicidal. See CONSTIPATION; ENTERITIS; GASTRITIS.

Dyspha'gia. See SWALLOWING.

Dyspho'nia, roughness of sound; in pathology, a difficulty in speaking. The disorder known as "clergyman's sore throat" is a common example. Rest of the vocal organs, tonics, muscular exercise, change of scene, are generally needed to aid recovery.

Dyspnea, disp-né'a. See RESPIRATION.

Dys'trophies. See MUSCLES.

Dysuria, dis-ŭ'ri-a, difficult or painful urination, a symptom of temporary disorder, a deep-seated disease. When dysuria is merely the result of a slight cold it can often be relieved by a dose of sweet spirits of nitre, or linseed tea.

Sometimes this symptom is the result of a stricture, or it may be caused by gravel, or stone, in which case the services of a physician should be obtained, and that without delay.

Dyveke, dü'vë-kë, mistress of Christian II. of Denmark: b. Amsterdam 1491; d. by poison 1517. She was the daughter of an innkeeper at Bergen, and Christian met her for the first time in the inn of her father. She accompanied the king to Denmark in 1507 and was constantly with him for the 10 years following. She is one of the most romantic figures in Danish history, and has frequently been celebrated in poetry and fiction as the victim of royal passion, and the insane jealousy of the nobility, who resented her exaltation.

Dzeren, dzë'rën, the "goitred" yellow antelope of China (*Gazella* or *Procapra gutturosa*), with unusually pale horns, and a protruding, goitre-like crop. It is indigenous to the deserts of central Asia, China, and Tibet, and is noted for its fleetness. The name "dzeren" is Mongolian.

Dzhol, the Arabian Saturn.

Dzierzkowski, tsërts'kôf-skë. **Joseph**, Polish novelist: b. Xaverov, Galicia, 1807; d. Lemberg 13 Jan. 1865. Among his works are: 'Salon and Street' (1847); 'The Twins' (1854); 'The Jugglers' (1855); 'The Crown of Thorns' (1856); 'Polish Chivalry' (1858), a historical novel; a drama, 'The Spark of Poesy' (1860).

Dziggetai, dzig'ge-tî, the native name for the Mongolian wild horse or wild ass (*Asinus* or *Equus hemionus*), also known as the Kiang (q.v.), and sometimes confounded with the Kulan (*Equus* or *Asinus onager*).

Dzoha'ra, the Arabian Venus.

Dzungaria, dzoön-gä'rë-ä, **Ili Proper**, or **Thian-Shan-Pe-Loo**, an extensive territory in central Asia, the boundaries of which are not very well defined. Dzungaria was originally the independent empire of the Dzungars, a branch of the Mongols, but about 1754 the territory was subjugated by the Chinese, under whom it remained till about 1864, when a rebellion broke out, and the Chinese settlements in Dzungaria were completely destroyed. A period of anarchy followed, which was not put an end to till July 1871, when Kuldja was occupied without opposition by the Russians. Since then the greater portion of Dzungaria has remained in the hands of the Russians, the rest being again under Chinese rule.

E

E the fifth letter of the English alphabet, as also of the alphabets of Greek and Latin, and of all the European languages except those which, as the Russian, use the Cyrillian alphabet, where the E has sixth place. The character corresponding to E in Hebrew and other Semitic languages, as Phœnician, Samaritan, Chaldæan, holds the same relative place in the alphabets of those languages. The form of the letter *he* in early Hebrew and early Phœnician was  and from that is derived the Greek **Ε** (epsilon), which is the Phœnician character reversed, with stem shortened and made perpendicular: this character represented in the Hebrew and other languages of western Asia, not the vowel sound E but the soft breathing. Taken into the Greek alphabet it was at first used to represent the vowel sound *e* whether short or long; but afterward the character **Η** was employed in Greek for the long *e* and was called *eta*, while the **E** received the name *epsilon*. The Latins used the **E** for both the long and short vowel and adopted the **Η** of the Greek alphabet to denote the aspirate. The name and sound of this letter in all European languages except English is *eh*, as in our interjection of inquiry: long *e* in those languages is invariably equal to *a* in *mate*, and short *e* equal to *e* in *met*: the long **E** of English is in those other languages expressed by the third vowel, **I**: thus, English *he*, *me*, *lee*, would in those languages be written phonetically *hi*, *mi*, *li*. In the standard alphabet employed in linguistic science the vowels *a*, *e*, *i*, *o*, *u*, are taken to represent the sounds *ah*, *eh*, *ee*, *oh*, and *oo*, and are named accordingly. The letter **E** occurs in English words far more frequently than any other letter or the alphabet: compared with **A**, **I**, **O**, **U**, its frequency of occurrence is as 1,000 to 728, 704, 672, 296 respectively; compared with various other letters it is as 1,000 to 770 (*t*), 670 (*n*), 392 (*d*), 280 (*c*), 236 (*f*), 120 (*b*), 22 (*s*). In frequency of occurrence as an initial letter it ranks only as eleventh and is to **T** as 340 to 1,194. One reason of the greater frequency of **E** in general use is that it often takes the place, in modern English words, of the vowels *a*, *o*, and *u* of Anglo-Saxon words; another reason is that final *e* is largely employed to lengthen the vowel of a preceding syllable, as in *there*, *here*, *cape*, *pane*: it is employed even where it serves no purpose of pronunciation at all, as in *gone*, *live*, *give*.

E as an abbreviation is used for *East*, *editio*, *emeritus*, and *ergo*; *e. g.* and *e. c.* for *exempli gratiā*, and *exempli causa*.

In music **E** is the third tone in the key of **C**, and the fifth semitone in the chromatic scale.

E. C. Sporting Powder is a superficially hardened, soft-grained, smokeless sporting powder, consisting, according to an analysis by C. E. Munroe, of 53.57 per cent of soluble cellulose nitrate, 1.86 per cent of insoluble cellulose nitrate, 3.12 per cent of unconverted cellulose, 34.26 per cent of barium nitrate, 4.55 per cent of potassium and sodium nitrates, 1.17 per cent of volatile matter, and 0.55 per cent of aurine, the latter being an organic coloring matter, used to impart an orange color to the grains. The manufacture, as carried out by the Explosives Company, after the method invented by Reid and Johnson, consisted in placing the moistened, pulped cellulose nitrates and metallic nitrates in "barrels" where, by rotation, the ingredients were mixed and then broken up into rounded grains, which were dried and then sprayed with ether-alcohol which at first gelatinized the surfaces of the grains, and then by evaporation left a hard skin about the grains. The coloring matter was added in the solvent.

E Pluribus Unum, ē plloo'ri-bus ū'nūm ("one from many"), the motto of the United States; chosen for its Great Seal 10 Aug. 1776, by Franklin, Adams, and Jefferson, as a committee. It has been part of the motto of the 'Gentleman's Magazine,' founded 1731; apparently taken by it from a sentence in Virgil's (?) 'Moretum,' "color est e pluribus unus."

Eachard, John, D.D., English clergyman: b. Suffolk, England, 1636; d. Oxford 7 July 1697. He became a Fellow of Catherine Hall, Cambridge, in 1658, and master in 1675. His writings include: 'The Ground and Occasions of the Contempt of the Clergy and Religion Inquired Into' (1670), and a 'Dialogue on Hobbes's State of Nature' (1672). He was a writer of considerable humor, but of no great ability.

Eadie, ē'dī, John, Scottish religious writer: b. Alva, Stirlingshire, 9 May 1810; d. Glasgow 3 June 1876. He wrote on theology with great vogue among the unlearned; his books including: 'The Divine Love' (1855); 'Paul the Preacher' (1859); etc.; in addition to scholarly treatises and commentaries.

Ead'mer, or Ed'ner, a mediæval churchman, historian of his own times and biographer: he flourished in the 11th and 12th centuries, dying at Canterbury about 1124. He was a Benedictine monk and was the companion, counselor, and friend of St. Anselm, Archbishop of Canterbury, whose life he wrote. He held a like relation to St. Anselm's successor, Radulphus, or Ralph, till 1120 when, invited to Scotland by King Alexander I., he was nominated bishop of St. Andrews; but went

back to his monastery because of a controversy having arisen over the king's right to nominate and the pretensions of the archbishops of Canterbury to primatial jurisdiction over the bishops of Scotland, which pretensions Eadmer upheld. He was even wont to say that he would refuse the highest see in Scotland if he must divest himself of his character as a monk of Canterbury. He wrote 'Historia Novorum,' that is, history of recent occurrences of his own times. Besides the life of St. Anselm he wrote the lives of three of Anselm's predecessors in the primatial see—St. Odo, St. Dunstan, and St. Bregwyn; also the lives of St. Wilfrid, and of St. Oswald of York; all of which writings have been printed.

Eads, ědz, James Buchanan, American engineer: b. Lawrenceburg, Ind., 23 May 1820; d. Nassau, New Providence, 8 March 1887. He early designed some useful boats for raising sunken steamers, and in 1861, when called to advise the Federal government, constructed within 100 days eight ironclad steamers for use on the Mississippi and its tributaries. He afterward built a number of other ironclads and mortar-boats, which were of considerable service to the North. He built an arch bridge across the Mississippi at St. Louis. (See EADS BRIDGE.) His works for improving the South Pass of the Mississippi delta were successfully completed in 1875-9; and his great plan for deepening the river as far as the mouth of the Ohio by means of jetties has been demonstrated to be entirely practicable. A later suggestion, for the construction of a ship-railway across the Isthmus of Tehuantepec, attracted much attention. In 1884 he received the Albert Medal of the Society of Arts, being the first American citizen to whom this honor had been awarded.

Eads Bridge, The, so named after its chief engineer, Capt. Jas. B. Eads (q.v.), is the great steel arched bridge over the Mississippi River at St. Louis, Mo. It has three spans, the central being 520 feet in the clear, and the side spans 502 feet. The rise of the central arch is 47½ feet. Each span consists of four steel ribs carrying two railways and a broad highway for teams, street-cars and pedestrians.

The bridge is remarkable chiefly in four respects: (1) The depth and size of the foundations and piers. (2) The method employed in sinking the piers. (3) The novel construction of the arched ribs. (4) The method of erection.

1. All four of the great piers stand upon the bed-rock far below the ordinary bottom of the river. The eastern river-pier extends 126½ feet below extreme high water, with a total height to the upper roadway of 109¼ feet. Its base is an elongated hexagon, 82 feet long by 60 feet wide. The east abutment pier has a larger base and a depth below high water of 134½ feet. These depths were beyond all precedent.

2. The deep piers were built upon hollow iron caissons which at first floated upon the water, and which later during the sinking were supported by the friction of the loose sand which formed the river bed, and by the compressed air in the chambers of the caissons. All the masonry was laid in the open air at or near the level of the water. The sand below the caissons

was removed by an ingenious device known as the sand pump (q.v.), invented by Capt. Eads. The difficulties encountered and overcome in sinking the piers to the rock, and in working men under several atmospheres of compressed air—form most valuable chapters in the history of bridge engineering. The air chambers were finally filled with concrete so that the piers now stand solid masses of masonry.

3. Each of the arched ribs consists of two parallel series of steel tubes, one above the other, and 12 feet apart. The tubes are 18 inches in diameter and about 12 feet long, with their ends slightly beveled so that they follow circular arcs. A tube is formed of six bars of steel inserted in a steel envelope one fourth of an inch in thickness, like staves in a barrel. Sleeve couplings and heavy braces give every rib the strength and rigidity of a continuous mass of steel. The first or springing tubes, which are very thick, are screwed into wrought-iron "skew-backs" which are fixed to the masonry by three or four steel (or wrought-iron) bolts 6¼ inches in diameter, and from 24 to 34 feet in length. Under moving loads and changes of temperature the tubes are alternately subjected to tension and compression. These arched ribs with tubular members are unique in engineering history and were the result of a vast amount of study and experiment. In construction they were very expensive.

4. The bridge was erected over a deep and rapid stream without centring and without interfering with the river traffic. The fixed end of a rib made it self-supporting while it was built out from above to about 100 feet; it was then supported by cables passing over the pier and over a temporary tower standing on the pier and by a secondary cable until the centre of the span was reached.

Recent investigations have found the bridge sufficiently strong for the heaviest locomotives and trains. When tested publicly 14 locomotives stood upon each span. Capt. Eads designed the piers, the arched ribs and the method finally adopted for closing them. Charles Pfeifer developed the mathematical theory of the arch, which was finely elaborated by Prof. William Chauvenet. The method of erection was devised by Col. Henry Flad, who gave to the whole work continued study and supervision.

Work on the bridge was begun in 1867 and finished in 1874. The cost of the bridge was about \$6,500,000. The difficulties, financial and physical, were many and great. Over 600 men were prostrated by the compressed-air work, and 13 died. The complete story with the "Theory of the Ribbed Arch" is told in 'The History of the St. Louis Bridge,' published in 1881 by the writer of this sketch. See BRIDGE.

CALVIN M. WOODWARD,
School of Engineering and Architecture, Washington University.

Eagan, Charles Patrick, American military officer: b. Ireland January 1841. In 1862 he entered the Union army as first lieutenant; in 1874 was promoted captain and commissary of subsistence; in 1892, major; in 1897, lieutenant-colonel; on 11 March 1898, colonel, and on 3 May, following, brigadier-general and commissary-general. In January 1899, he made remarks concerning Gen. Miles, in his testimony before the War Investigation Commission, for

EAGLE

which he was tried by court-martial and sentenced to dismissal from the army. His sentence was commuted by the President to suspension from duty and honors for six years. On 6 Dec. 1900, he was restored to duty and immediately afterward retired.

Eagle, James Phillips, American Baptist clergyman: b. Maury County, Tenn., 10 Aug. 1837. He was educated at Mississippi College (1870). He served through the Civil War as a Confederate in all grades from private to colonel. In the close of the War he became a Baptist minister and cotton planter in Arkansas; has been elected four times to the Arkansas legislature, served one term as governor of the State, and for years has presided over the Baptist State Convention.

Eagle, as a popular name includes several raptorial birds which vary in some respects from the strictly defined group in which science has been wont to place it. The order *Accipitres*, to which it belongs, is broad enough in definition to include all the vultures, the typical eagles, and the buzzards. Recent osteological demonstrations, however, have led to the separation of American vultures from the Old World vultures, including the latter in the family *Falconidae*, to which eagles and vultures belong. This family, which embraces 300 species of diurnal raptors, is characterized by imperforate nostrils, legs of medium length, and, except in the Old World vultures, a feathered head, a bill decidedly hooked, the hind toe inserted on a level with the three front ones, and the claws roundly curved and sharp. The subfamily *Aquilina* makes prominent the cutting edge of the upper mandible, the bony shield over the eye, the feet heavy and short, either scutellate or feathered. The Lämmergeier (*Gypaetus barbatus*), lamb-killer, or bearded vulture of the Alps, the Pyrenees, and the Himalayas, finds its nearest affinity here. The *Aquilina* are naturally divided into two genera: *Aquila*, land eagles, and *Haliaeetus*, sea-fishing eagles. The former is feathered to the toes, the latter half way to the toes.

The leading specimen of *Aquila* is the golden eagle (*A. chrysaetos*) one of the largest and most magnificent of its kind, dark brown with purple gloss; head and neck brownish-yellow; tail rounded and dark brown, ending in light and dark tints. The length is about three feet, the extent of wing seven feet. In North America its range is from Mexico north. It is very scarce in the United States but more abundant in Canada, where it is distinguished as *canadensis*. It is regarded as a variety of the European species, which seldom occurs in England, though more prevalent in Scotland, where the demand for its eggs has favored its increase. The nest is usually placed on some inaccessible cliff, the eggs are spotted and do not exceed three. Closely allied to the golden eagle are the imperial eagle (*A. mogilnik*) of southwestern Europe and of Asia, and the king eagle (*A. hiliaca*) of the same range. The smallest of the kind is the dwarf eagle (*A. pennata*) which measures less than two feet and is native in Southern Europe, North Africa and in India.

First in interest among the sea-eagles stands the bald-headed eagle (*Haliaeetus leucocephalus*), selected as the national emblem. Its markings are familiar, though the term "bald" is to be

referred not to the absence of feathers, but to the effect produced by the white feathers on the head. In size, it corresponds nearly to the golden eagle, but it differs in its habits, living mainly upon the fish which it seizes along the sea-shore and around lakes and rivers. The nest is built on a high tree top or upon a rocky cliff. A finer specimen than this is the northern sea-eagle (*Haliaeetus pelagicus*) of northeastern Asia. It is conspicuous by its large form and bill, and by the contrast of its main color, brown, with the white of its shoulders, rump and tail. The African sea-eagle (*H. vocifer*) is a fish-eater, about half the size of the "bald-head," remarkable for its color-markings, being white on the head, neck, and breast, while the under parts and wing coverts are chestnut, and the upper parts are black or brown. Nearly related to the *Haliaeetus* is the fishing-eagle (*Polioaetus ichthyaeus*) of India and the East Indies, with extremely curved talons, and living entirely on fish. In countries bordering on the Mediterranean and ranging into India and Central Europe, is the serpent-eagle (*Circus gallicus*) with short toes, white, brown-spotted under parts, and dark brown upper parts. It feeds upon reptiles, which it kills and carries away, not eating the game on the spot, as do other eagles. A buzzardlike genus, *Helotarsus*, is represented in Southern Africa by *H. ecaudatus*, the short-tailed eagle, ornamented with maroon and black plumage, and bright red, very short legs.

The buzzard-eagles include some species which command notice from their great size and powerful action which fairly entitle them to their name. South America, in the dense forests of the Amazon, is the habitat of the Guiana eagle (*Morphnus guianensis*) relatively small, but with a tail longer than that of almost any other species. The wings are short and rounded, adapting it to swooping down with great force upon its prey, rather than for lofty or prolonged flight. From southern Mexico through the forests of Brazil, the harpy-eagle (*Thrasaetus harpyia*) has its home, and for muscular power is scarcely surpassed by any bird of prey in the world. It is larger than the golden eagle, gray in color, with long crest feathers, a stout, vicious bill, and talons of extraordinary force and sharpness. Though rapacious and apparently destructive, the eagles are useful in killing many other birds which venture nearer to farms and human habitations, in reducing the number of injurious reptiles and small mammals, and in helping to preserve the balance of the animal world.

Eagle, a gold coin in the United States of the value of 10 dollars, or £2 1s. 8d. sterling, and weighing 258 grains troy, 900 fine. It was first coined in 1795, in accordance with an act of Congress, dated 2 Jan. 1792. There are also half eagles (first coined in 1795), quarter eagles (first coined in 1796), and double eagles (first coined in 1849), of proportionate values.

Eagle, in astronomy, name given to a northern constellation, from the bird supposed to have carried the thunderbolts of Jove. The constellation is usually called by its Latin name, *Aquila*. The most important star in the constellation is Altair, whose brightness is nearly that of a typical star of the first magnitude.

The name is also given to the standard carried by the ancient Roman legions. This standard consisted of a staff, with an eagle perched upon its extremity. A special band of men was appointed to precede and guard these eagles, which always led the army into battle. The French battle standard, in imitation of the Roman, is also surmounted by an eagle.

In heraldry a bearing of frequent occurrence, and often assumed by sovereigns as the emblem of empire from having been borne on the legionary standard of the ancient Romans. The United States, in 1785, adopted the bald eagle, its wings displayed, proper, as the national emblem. The eagle of Russia is *or*, with two heads, displayed, sable, each ducally crowned of the field; the whole imperially crowned, beaked, and membered gules. The eagle of Austria is also displayed with two heads. The Prussian eagle has only one head.

Eagle, Black, a term applied to the golden eagle, *Aquila chysactus*, also to the young of the bald-eagle. See EAGLE.

Eagle, Black, Order of, a Prussian order, founded by Frederick II. in 1701. The number of knights in the order is limited to 30, exclusive of the princes of the blood royal, and all members must be of unquestioned nobility. The badge is a cross of eight points having in the centre a circle with the monogram F.R. (for *Fredericus Rex*); the four arms are enameled red with the eagle of Prussia in black enamel between each two arms.

Eagle Hawk, or **Hawk Eagle** is the name for a group of some rather small and some large raptorial birds, closely related to *Aquila*, and chiefly represented by the genus *Spizactus*. They are beautifully crested and range in South Africa, Central and South America. A notable specimen is the crowned eagle (*S. coronatus*) of South Africa, of medium size, its under parts buff, banded with black, the head furnished with a crest of long, brown feathers. Of the same geographical range is a species of *S. (Lophoactus) occipitalis*, a small bird with a crest four inches long. In Central and South America are crested members of the group, *S. (Lophotriorchis) isidori* and *S. ornatus*.

Eagle Owl, an owl of the genus *Bubo* (family *Strigida*, horned owls, order *Accipitres*, represented in nearly all parts of the world except Australia. Of rare occurrence in Great Britain, it is common in the foot-hills of the Ural Mountains, and throughout Siberia as far as China. In the northern Old World *B. ignavus* is one of the largest owls, of unsurpassed strength and daring. The colors are black, brown and white, mottled. A grown specimen weighs about eight pounds and measures 26 inches from bill to end of tail; the wing is 18 inches long, and the plume feathers, constituting the horns, are nearly 4 inches in length. It is the boldest and most ravenous owl, and is a match for the eagle. To the superstitious people of the north, its weird call-note sounded at night in the depths of the forest announces the presence of evil spirits. The great horned-owl of America (*B. virginianus*) bears a general likeness to its European congener, though smaller in length of body and wing. The colors are the same but differently arranged. The lower parts are barred rather than spotted, the breast and throat are marked with a large white patch, and a

black ring is stamped on the disk of the face. Like the European species, it preys upon hares, large ground birds, rats, mice, reptiles, and fish, and besides on the young of the American turkey.

Eagle Pass, Texas, town, county-seat of Maverick County; on the Rio Grande River; the Mexican I. and the S. P. R.R.'s; about 155 miles southwest of San Antonio. It is a trade centre for a coal mining and cattle section, and the shipping of cattle, hides, and wool is steadily increasing. It contains large brick and lumber yards. Pop. 3,200.

Eagle Ray, a fish of the order *Raia*, of which the torpedo and the sting-ray are familiar members, and associated with the sea-devil in the family *Myliobatida*. It is a flat fish with a very broad disk distinguished by pectoral fins which continue to the snout and then reappear at the extreme end of the head. The tail is long and slender like a whiplash. The teeth are flat for crushing crabs and for grinding shells. Though much smaller than the sea-devil, which is sometimes immense, the eagle ray often attains a considerable size. It brings forth its young alive, and inhabits tropical or subtropical waters.

Eagle, Red, Order of, originally called Order of the Red Eagle of Baireuth, and also called Order of Sincerity; founded by the Margrave of Baireuth in 1705. The badge is an eight-pointed cross, having in the centre a medallion with a red eagle bearing the arms of the Hohenzollern family.

Eagre, a Norse word signifying a formidable influx and surging of the tide, the same as *bore* in a river, as in the Severn and Hough's rivers and the Bay of Fundy. See BORE.

Eakins, ĕk'inz, **Thomas**, American artist; b. Philadelphia 25 July 1844. He was a pupil of Gérôme. He has been professor in several art schools, lecturing there on anatomy and painting. Among his works are many pictures of American domestic scenes, out-of-door sports, portraits and several large canvases, such as Dr. Gross and Dr. Agnew at their clinics. The colossal figures of the prophets, Witherspoon building, Philadelphia, were molded by him and his pupil Samuel Murray.

Ealing, ĕ'ling, England, town, and also a parliamentary division of Middlesex, the former a few miles west of London. The town has a free library, science and art schools, and a training college for teachers of the deaf. Pop. of town 23,979; of the parliamentary division 70,748.

Eames, ĕmz, **Charles**, American lawyer and journalist; b. New Braintree, Mass., 20 March 1812; d. Washington, D. C., 16 March 1867. He was graduated at Harvard in 1831, and began the study of law. After accepting a position in the navy department at Washington in 1845, he took editorial charge of the *Washington Union*. He was sent by President Polk as U. S. Commissioner to the Sandwich Islands, and afterward became United States minister to Venezuela, under President Pierce. Returning in 1858 he gained a great reputation as a lawyer in admiralty cases.

Eames, Emma, American operatic prima donna; b. Shanghai, China, 13 Aug. 1867. She studied music in Boston and Paris, singing in

churches and concerts in the former city, and making her début in grand opera, Paris, 13 March 1889, in 'Juliette,' appearing in grand opera at the Covent Garden, London, 1891, and in New York the same year, since which time she has been a popular member of grand opera companies in Europe and America. She married the well-known artist, Julian Story, 1891, and resides in Paris, France.

Eames, Wilberforce, American bibliographer: b. Newark, N. J., 12 Oct. 1855. He has long been prominent in bibliographical matters, having been assistant at the Lenox Library, New York, 1885; assistant librarian 1892; librarian 1893-5, when upon the consolidation of the Astor Library and Tilden Trust as the New York Public Library, Astor, Lenox and Tilden Foundations, he became librarian of the Lenox branch. He edited volumes 15-20 of 'Sabin's Dictionary of Books relating to America' (1885-92). Among his works are: 'Bibliographies of the Bay Psalm Book' (1885); of 'Ptolemy's Geography' (1886), and of 'Sir Walter Raleigh'; bibliographic notes on 'Eliot's Indian Bible' (1890), reprinted from 'Pilling's Indian Biographies,' and a bibliographic account of the early catechisms of New England (1898).

Ear, Anatomy, Physiology, and Disorders of the. In most of the animal creation the vibrations which we term sound have special portions of the body for their recognition, more or less precise; although in the lower forms every part of the simple organism can respond to them in some degree. The earliest separation of a distinct hearing-organ is seen in the Meduse, of which the common nettle of the salt waters is a well-known example. Here we find certain of the tentacles covered with delicate cells having hair-like projections and enclosing a chalky concretion, the otolith (Fig. 1). This structure of a tiny vesicle with single or mul-

FIG. 1.— 1. Hairs of the hair-cells; 2. Otolith; 3. Sensitive (nerve) cells.

multiple otolithic contents (Fig. 2), connected with the more sensitive or distinctly nervous portions of the organism may be regarded as the fundamental form of the ear; as it develops, it takes on more and more complicated forms

of fluid-containing sacs deserving the name of "labyrinth," in which chalky particles (often of special crystalline form) lie in close relation to "hair-cells,"—as we term these structures with their delicate prolongations. A nerve, more or less defined, passes to the sac (Fig. 3) and connects it with the sensory centres, which in the vertebrates and some of the higher invertebrates may be called brain-centres. This apparatus is in the vertebrates imbedded in the cartilage or bone on either side of the head; and in those creatures which do not live in the water, accessory apparatus

FIG. 2.— 1. Otolith; 2. Hair-cells directed toward cavity; 3. Nerve-cells.

is present to help transmit the air-vibrations to the fluid ("endolymph") of the labyrinth. As we pass up the scale of animal life the organ of equilibrium is found in relation to that of hearing; and thus in the lowest fishes we find that the sac assumes a ring-form (Fig. 4) by reason of the formation of a semicircular canal with a pear-shaped widening or ampulla at either end. In these the nerve terminates in hair-cells without otoliths, while between these a larger portion of the sac receives the main nerve-supply at a prominent "macula" supplied with hair-cells and otoliths. A second and a third semicircular canal, each with its own ampulla and nerve, is found in the higher forms, and the main sac divides into two increasingly separate portions with separate nerve-supply. One of these portions communicates with the semicircular canals, while the other is connected with a tubular outgrowth, which in the highest forms coils into a spiral and is encased in a snail-shell covering, which gives it the name of "cochlea." The nerve passing to this becomes highly developed and the end-organ is greatly elaborated into an apparatus generally called after its discoverer, "Corti's organ." Around this essential apparatus more and more complex protective envelopes and spaces filled with "perilymph" have been developed, while accessory apparatus, called middle and external ear, have been formed to aid in the conduction of sound-waves to the percipient contents of the labyrinth.

The development thus roughly traced in the ascending scale of animals can be still more perfectly seen in the development from the ovum of the embryo of the higher forms. Here we see a portion of the external surface dip inward as a pit, become separated as a closed sac beneath the surface, undergo the elaboration described, secure nerve-connection with the brain and at such points of communication develop its hair-cells and otoliths. Originally a spherical sac, its complexity soon merits its name of labyrinth and this membranous laby-

rinth gives form to a surrounding labyrinth of cartilage or bone, which has been longer known and studied.

Taking the human ear as representing that of all the higher vertebrates and as an elaboration of that of lower animals, we find an acoustic nerve emerging from each side of the pons or lower back part of the brain, to pass, in close association with the nerve giving motion to the face, into the stony-hard, innermost part of the temporal bone which encloses the ear, but may be paralyzed by involvement in tympanic disease. The facial nerve passes on through, and practically has but accidental relation to the ear. The acoustic nerve, containing nerves for the organ of equilibrium, divides and

certainly the apparatus in form and elaboration meets most of the requirements of such a theory and its partial destruction by disease has caused loss of hearing for certain tones—low if the apex, high if the base, be injured.

Outside of the labyrinth or *percipient* apparatus we find a *conducting* apparatus of external and middle ear (Fig. 9). The outer ear is formed by the in-growth of a pit of the skin-surface to constitute an external auditory canal, around the edge of which gristly projections raise the skin-covering into the prominent but unimportant features to which the name "ears" is commonly applied. The inward growth of the canal brings its bottom into close relation with the middle ear, so that only a thin partition, the drumhead, intervenes. The middle-ear is an outward development of the mouth-cavity, which hollows out the tissues between the external and internal ears—forming the Eustachian tube as its inner portion, the drum-cavity or tympanum just within the drumhead at the bottom of the external canal, and other air-spaces, "mastoid cells," of less constant presence and form and of doubtful value, but notable because of serious disease-conditions to which they are subject. Two "windows" make communication between the internal and middle ear, both closed by membranes shutting in the fluids of the labyrinth—that closing the lower "round window" being called the secondary tympanic-membrane. The upper or "oval window" is occupied by the foot-plate of the stirrup-bone, which with the little hammer and anvil forms (Fig. 11) a compound lever between the drumhead and the labyrinth-fluids. This serves to increase the force while lessening the amplitude of the vibrations of the drumhead and thus aids the transmission of waves of sound, especially of low tones, from the air to the internal fluids. The lower animals move the external ears as an aid in locating sounds, but the muscles effecting this are rudimentary in man and the external ear can be lost with little recognizable impairment of hearing. More important, although of ill-determined working, are the muscles moving the little bones of the drum-cavity; one, the drumhead tensor, drawing in the hammer-handle and thus tightening

FIG. 3.—1. Otolith; 2. Hair-cells; 3. Nerve-trunk.

is distributed to the various parts of the labyrinth. At each point of its distribution cells with hair-like projections form end-organs through which impressions are received to be conveyed to the brain. Three of these points are in the three pear-shaped swellings of the semicircular canals, two are in the two vestibular sacs and the most elaborate enters the base of the snail-shell (Fig. 8), and is distributed to the highly elaborated organ of Corti, here located. This consists of a fairly orderly arrangement of hair-cells without otoliths, supported by curiously modified cells of like origin (Fig. 7), all resting upon a delicate "basilar membrane" narrowest below and broadest above, which winds spirally from the bottom to the top of the shell-like cochlea, and is formed of parallel transversely stretched fibres. Here we have an apparatus comparable to the strings of a harp or piano; and just as each string of a musical instrument can vibrate in accord with those attuned to it in another and can even repeat the tones of an inaudibly distant instrument with which it is connected by a wire; so there is much to support Helmholtz's claim that each fibre of the basilar membrane is a cord tuned to a certain pitch and vibrating responsive to any tone of that exact pitch which reaches it. This serves to excite a special hair-cell resting upon it and send a nerve-impulse along the ultimate nerve-fibril of which this forms the terminus. Cer-

FIG. 4.—1. Acoustic nerve and macula in vestibular sac which communicates with (2) the anterior and (3) posterior ampulla of (4) the semicircular canal.

the drum-membrane to which it is attached, and one acting on the stirrup. Even the drumhead and chain of little ear-bones can be actually or virtually destroyed with preservation of a large part of the hearing; but their presence in damaged condition may be a serious obstacle to useful function by impeding sound conduction.

EAR

The upper and lower limits of human hearing are somewhat in dispute, but it is fairly safe to say that tones of 32 double vibrations per second and up through 10 octaves, should be audible to a healthy ear. If a cog-wheel touching a card or other elastic plate be turned with increasing speed the individual strokes or vibrations can be distinguished up to 16 per second;

sureing its defects. Variable as are voices or even the same voice within its range, it constitutes our best practical test of the degree of deafness. Generally the faintest articulate whisper should be heard at arm's length and a loud "stage whisper" 50 feet or more. The numbers up to 100 make good tests if rightly selected and should be spoken clearly with the "reserve-air" which can be expelled from the lungs after an ordinary "tidal expiration"; and they should be repeated by the person examined in evidence that they have been correctly heard. The watch is a very variable, limited, and imperfect test, which may be ill-heard by ears otherwise perfect, well-heard by some with little useful hearing and imagined or falsely claimed to be audible when it is not, in a way not always easy of detection. All measurements of hearing for sounds or speech should be made with the eyes screened from seeing the approach of a sounding body or "reading the lips" as many deaf persons do most successfully, at times unconsciously. Medically, the best tests of hearing are by speech and by tuning-forks—the latter serving not only to measure the hearing or loss of it, but to locate the seat of trouble as a prime requisite to successful effort for recovery. A "continuous tone-series" of tuning-forks or other instruments may be used by the expert to test the entire ten or more octaves; and the aurist should always have several forks, although much may be learned with a single one. A fork of 200 to 500 double vibrations per second is the most useful and should be seven or more inches in length and weigh as many ounces: the latter is important as the loudness and duration of tone depend upon it. One of 30 to 50, and one of 2,000 double vibrations should also be used, while intermediate tones have value. The lower forks should have thickened ends or clamps or pieces of rubber-tubing on the tips

FIG. 5.—Developing labyrinth dividing into two sacs with separate areas of hair-cells.

then they blend and a continuous tone is produced; but the tone heard may be an overtone and not that of 16 per second as is often claimed. Through the thin young drumhead or one having an opening in it still higher tones can be heard, probably up to 55,000 vibrations; but age and disease easily effect changes which bar out these high and relatively weak tones; yet it is striking to note how well they may be heard by those deaf to ordinary speech. Those unable to enter general conversation by reason of impairment of the conducting apparatus may often hear the same voice readily over the telephone, which transposes it to a higher key; and some much-advertised hearing-helpers have their value as portable telephone lines. Human speech, the hearing of which is in civilized life the most important use of the ear, has a range from near the lowest limit of perception in the sound of R to some 4,000 vibrations per second in the sibilants S and X. We have in speech, therefore, with its easy gradations of intensity from faint whispers to loud shouts, a ready means of testing the hearing and mea-

FIG. 6.—Diagram of the cochlea in section with the channels for its nerves and the perilymph spaces which surround the cochlear canal in its windings.

to damp the "over-tones," which may be heard by ears to which the fundamental note is inaudible. The fork should be struck by falling of its own weight through its own height upon a rather dead surface such as the top of the knee, and will thus give a tone of fairly constant strength; and testing a number of normal ears will show for each fork at what distance

or for how many seconds it should be heard after a standard blow. Thus if a fork which a normal ear hears at 15 inches or for 100 seconds is heard by a deaf ear only 5 inches or for 30 seconds, $5/15$ or $30/100$ fairly represents the fraction of hearing remaining. Ears with impairment of the percipient apparatus of the internal-ear hear high sounds relatively less as a rule; those with the more usual conduction-defect hear low tones worse. A case of "nerve-deafness" may hear no sound from the 2,000 fork—a case of tympanic catarrh none from the 50 fork; although all other tones are fairly or even perfectly heard. A whistle de-

paratus sounds produced or conducted within the head. The deafer ear may hear the sound by bone-conduction better than its fellow. More than this—it can often hear better than a normal ear, perceiving through the bone for 50 seconds, perhaps, the vibrations which ought to be heard for only 45. With this generally goes a marked loss of hearing through the air, which may be reduced from 100 seconds to 40, 20, or less. Under such conditions bone-conduction will be better than air-conduction and the sound will be louder as well as longer when resting on the head. This constitutes Rinne's or Schwabach's test and is simplified by resting the handle of the lightly vibrating fork back of the ear and then placing it outside the opening with the question "louder back or front, front or back?" The perception through the bone, especially at the bridge of the nose, ought to be nearly the same in duration as the *feeling* of the vibrations by the examiner's fingers; and Gardiner Brown saved time and confusion by noting how many seconds before or after his fingers lost the vibration, it ceased to be heard in the ear. Bone-conduction may greatly preponderate, in evidence of the conductive defect in an ear with marked loss of air-conduction, and yet this test or Schwabach's timing will show that the percipient apparatus is also defective and loses the sound sooner than normal, instead of having it exaggerated. So we must test the actual, as well as the relative, perception through the bone.

Another delicate and important test may be here mentioned. The drum-cavity communicates with the throat back of the nose by a trumpet-shaped tube called after its describer Eustachius. This serves as a drain for the removal of any mucus from the drum-cavity and as a ventilating passage for maintaining equal air-pressure on each side of the drumhead. It is really a slit habitually closed, but opens in the act of swallowing or yawning, from the action of the muscles lifting the palate. If a sounding tuning-fork, then, is held before the

FIG. 7.—Scheme of human cochlear canal in section showing Cortis organ and its nerve connections.

vised by Galton giving tones from 4,000 up to 40,000 double vibrations is a practical and useful aid in studying the upper limits of hearing, as are the steel rods suspended by threads introduced by Koenig, since tuning-forks of such a pitch are unusual and costly. All of these tests should be made at the side of the head, but not so near that they may be *felt* instead of heard. The other ear may need to be closed with a down cushion or other adequate cover and we must avoid several "deaf-spots" nearly opposite the opening of the canal where the sound-waves by interference are weakened or lost.

Thus far we have considered tests of the hearing for sounds coming through the air in the usual way; but if the handle of a vibrating tuning-fork or other sounding instrument be rested upon the head it will be heard through the bone, and the sound will generally be much louder if the fingers are stuck into the ears. If only one ear be stopped, it will be heard louder in this ear—so much so that the other generally fails to recognize its vibration, even though the fork is resting close behind or above it. Normally this "bone-conduction" is only half as loud as "air-conduction"—the fork which should be heard for 100 seconds through the air in front of the ear is heard but 45 when resting behind it. It can usually be heard from the bridge of the nose or the teeth after it has become inaudible back of the ear; but when unheard here it should be audible for a further period if held close outside of the canal-opening. Yet disease-conditions can affect the matter like stuffing the fingers in the ears; the obstructions in the conducting apparatus which bar out in greater or less degree the outside air-vibrations shut in and echo back upon the percipient ap-

FIG. 8.—Cut through the cochlea, showing its nerve (4) passing to the turns (2,7) of the cochlear canal, above which are those of the vestibular scala (5) and below the tympanic (6); the facial nerve (3) is seen in close relation to the auditory.

nostrils as the patient swallows there should be a brief opening of these tubes permitting freer passage of the sound to the ear. We thus determine the normal action or its lack

EAR

in these very essential parts of the apparatus.

This proper ventilation of the drum-cavity is needful for perfect function. It is said that the head of the military drum will split if there is no opening in the side; and certainly a stuffed Eustachian tube makes all concussions painful if not damaging to the drum-membrane. Any excess of pressure within interferes with the freedom of the windows, while any lack of air makes pressure on the outside preponderant, forcing in the drumhead and through the chain of bones pressing upon the labyrinth. More than this, if the partial vacuum in the drum-cavity is increased through absorption of the unrenewed air by the moist lining, the drumhead becomes stretched until it collapses into contact with the inner wall, or the walls congest and swell to fill the space or else fluid is poured out to occupy the cavity. Generally all of these results are present in varying degree and from this comes the large majority of ear-diseases. So, too, interference with the freedom of the breathing through the nose unfavorably affects the ears. If one holds the nose and blows, air will be forced up the tubes into the drum-cavities, and swallowing motions have to be made

this patient that only the recent losses can probably be recovered, and that ill-health or recurrent cold-takings may offset his best efforts. Yet many of these cases tend to grow steadily worse unless judiciously treated and a gain, however slight, is better than a loss. Mere inflation of air up the Eustachian tube by the Politzer bag or the catheter can aid the earlier stages; but in chronic conditions intratympanic medication must be used to stimulate the lining of the drum-cavity and retrace the steps by which it has become thickened and stiffened.

Accompanying the defect of hearing for outside sounds there may be greatly increased hearing of noises within the head. Every one hears a singing in the ear when a shell or other resonator is held against it, and similar results often follow any thickening and stiffening of the conducting apparatus. Tinnitus, as the subjective sound is called, may be due to many causes, however, and its relief is often difficult. Generally a perception of the sounds of the blood-circulation, it may be caused by changes in the blood itself in anemia, by overaction of the heart, by brain-pressure due occasionally to stuffiness of the upper nasal passages, as well as to more local affections. It is usually worse when lying down and in a silent place, since outside noises and occupations of mind and body make it less noticeable; but it is in some cases unceasing and intrusive, seeming to bar out other hearing, and may be almost maddening. In its milder forms it is annoying and excites apprehension of deafness or of brain-disease, with which it is known to be sometimes associated; but its many causes, often wholly trivial, must be remembered and rational measures employed for its relief. As stuffing of the Eustachian tubes or tension of the drumhead and chain of bones are its common causes, much relief can often be gained by simple hot gargling to

FIG. 9.—Section through external ear with its pinna (1) and (4) canal and the middle ear with its drumhead (7) and Eustachian tube (10), showing the labyrinth with its cochlea (12) and semicircular canals.

to relieve the distention. If this swallowing is done while the nose is held closed, strong suction is exercised, making partial vacuum in the drum-cavity, and this occurs when cold-taking stuffs up the nose or tonsillar enlargement narrows the upper throat just behind it. It is not surprising then, to find that two thirds of ear-patients have middle-ear trouble, only one fourth external-ear affections and in hardly one tenth is the perceptive nervous apparatus at fault. This explains why much of the treatment of ear-diseases must be directed to or through the nose and throat in the effort to restore free ventilation and repair the injury due to the lack of it. The unfavorable influences are often slow and insidious in action; deafness may be advanced in one ear without attracting the notice which any defect of the second ear quickly forces upon the attention; and treatment must be long-continued if it is to retrace much of the course by which the affection has passed to its later stages. Discouragements are frequent, and the conscientious aurist has to tell

FIG. 10.—Developing ear with cartilage in the partition between external and middle ear, which are beginning to form.

free the former, or gentle massage of the drum-structures, as may be well done with the hands.

A curious characteristic of conduction-defects is the ability to *hear better in a noise*, often better than normal ears. A person deaf to ordinary speech in a quiet place will hear on a train much that is inaudible to persons nearer the speaker. One with nerve-deafness will be un-

duly disturbed by other noises, although perhaps unconscious of defect in a still place.

Only less important than freedom of the Eustachian tube is a healthy free condition of the external canal. This is lined with skin and supplied with glands like the sweat-glands elsewhere, but furnishing the ear-wax or cerumen which consists of the dead skin-scales and oily material. The purpose of this seems to be to arrest by its stickiness the entrance of dust, small insects, etc., from outside; but it serves a more useful purpose in cleansing the ear. The growth of new skin is most active at the centre of the drumhead and is there rapid enough to spread out over the membrane, moving the older cells before it by a glacier-progress which carries them beyond the margin and out upon the

FIG. 11.—Inner surface of drumhead (9), to which is attached the handle (7) of the hammer, the head (5) of which is hinged to the anvil (4), the long arm (6) of which connects with the stirrup (10) the chain pivots on the horizontal arm (3) of the anvil and conveys vibrations to the labyrinth.

walls of the canal before they become effete enough to be thrown off. Hence the normal drumhead is self-cleansing and needs no officious aid. The loosening scales of dead skin pass out along the walls of the canal and about its middle become a pasty mixture with the secretion of the cerumen-glands. This clings to the fine hairs of the canal, but is gradually worked outward by the motions of the jaw-joint, which presses upon the canal, and drying into unnoticed scales it escapes from the exit. Under diseased conditions, including those of the throat and middle-ear, the wax tends to diminish in quantity and grow harder, escaping less readily or collecting in firm plugs. So long as any crack remains for the sound-waves to pass between it and the wall, hearing may be unaffected by an almost total filling of the canal; but jarring may force it down upon the drumhead and moisture may swell it into complete closure. Marked and sudden deafness results, often with dizziness, tinnitus or coughing. The plug may dry or crack away from the wall, quickly relieving the trouble, but only for the time; and it becomes so

moulded to the irregular curves of the canal as to make it difficult to remove. Most of the sponges and spoons offered in the drug-stores are good only for ramming in the wax more firmly and pressing it down upon the drumhead. They should never be used. The best solvent for ear-wax is hot water, and it should be syringed in with gentle force until the last particle of the plug has been removed. Dropping in of oil or other fluids rarely does much to loosen the collection, they can often increase the distress caused by its presence—they certainly cannot remove it, although some hope that they will do so seems present to many that use them. Any violence in digging out the plug or too vigorously working even with the syringe is to be condemned. Underneath it skin-flakes have been forming which are often partly incorporated in its mass, partly still fast to the walls—ready like “hang-nails” to tear down into the quick and leave open wounds, very easy of infection. One seventh of the work of the aural surgeon consists in removing ear-wax, rather especially for those of his private patients who *seek to be too clean*. It is easy to do it skilfully and promptly, yet it is often not so removed. If spoon-like instruments be used at all they should be *sharp*—they will thus be more efficient, while no mistaken idea of harmlessness will make them doubly dangerous. There is many a thing besides a firearm that a man “did not know it was loaded.”

Seeds, beads and other foreign bodies are sometimes put into the ears. If they are let alone they may remain for many years without doing the least harm; but forcible removal has often done great or fatal injury. If the ear is directed downward they will often fall out, especially with a little rotary rubbing in front of the ear. The syringe will almost invariably bring them away promptly and safely. If they have been rammed in and fixed, it is really gentler to remove them by laying forward the soft parts under ether and operating in the bony canal.

Two other affections of the external ear make up much of the 25 per cent of disease involving this part—the diffused and the circumscribed inflammations of the canal. The first may be broadly called eczema—the latter furuncle or boil. Gout and many general conditions can predispose to the eczematous inflammation, which by its heat and moisture makes the ear a hot-bed for the growth of the moulds and bacteria which maintain or increase the trouble, and it may have an intensity verging into erysipelas. The milder, chronic forms are generally responsible for furuncles, for they furnish the itching which leads to scratching and the germs which punish this. “What did you scratch it with?” will generally bring confession of a hairpin or a match-stick according to the sex, and boils are more common on the right-hand side. The suffering caused by a boil may be extreme; sometimes keeping the patient walking the floor all night. They are rarely serious matters, but each tends to cause others, so they cannot be made light of. They consist of an infective inflammation of the glands of the skin lining the canal and are apt to be trivial when the superficial sebaceous glands are involved, but more severe if a deeper cerumen-gland is

EAR

the seat. These glands extend into the subcutaneous tissue, possibly into the periosteum, so their inflammation can excite a periostitis pressing the ear out of place and perhaps strongly suggesting mastoid inflammation. Pressure or motion of the parts, as in chewing, is acutely painful; but firm pressure on the bone can be comfortably borne if all motion of the canal be avoided. Hot douching (110° F.) is usually comforting and if fully used has an excellent tonic effect; warmth and moisture often increase and renew the trouble. The infection should be fought by mercurial oxide ointment and, if bearable, a firm plug covered with it should be passed into the swollen canal where it will exercise pressure, secure a useful massage from each jaw-motion and continue throughout the day the rubbing in of the salve.

Bony outgrowths of the walls sometimes narrow or close the external canal and less often cancerous growths involve it and the external ear. The bony growths are curiously common in the ears of ancient Peruvian and Mound-builders' skulls and in modern times in Hawaii and in England. The London surgeons among their private patients see and remove more of these bony outgrowths than are reported from all the hospitals of the world. Their causes are not clear, and bathing has been suggested as influencing their formation. As seen in other than Englishmen, the great majority seem due to long-continued discharge from the ear; and this suppuration must be cured or the growth removed, lest the confinement of pus may lead to serious or fatal complications.

The suppurative inflammations of the middle-ear form the most important phase of our subject, not only because of their malign effect in producing deafness and deaf-mutism, but from their serious menace to the life. Thousands are known to die annually from ear-diseases, and the records of large numbers of post-mortem examinations show that a larger proportion usually escape recognition during life. The prevalence of influenza for ten years past has hugely increased the frequency of serious outcomes, as well as served to bring them to notice; but even before that the record was long and grim. All the eruptive fevers, especially scarlatina, measles and typhoid, are apt to bring involvement of the ears. These should, therefore, be closely watched and generally guarded in some measure by coverings, especially in children, who may never call attention to their ears and yet if they lose hearing are prone to become deaf-mutes.

It is well known that discharge from the ear is apt to lessen or cease at the onset of serious extension and that bottling up of the flow may give rise to such results; but the somewhat prevalent view that such suppuration should be "let alone and it will be outgrown" is as mistaken as is the idea that it is dangerous to bring it to an end. To "stop it up" is wholly different from stopping it by cure: and the chronic cases of slight discharge, often hardly noticeable, are those from which fatal diseases such as brain-abscess, pyæmia, and sinus-clotting are generally recruited. Few good insurance companies will have anything to do with a man having a long-standing running ear—the risk for the individual may not be very noticeable, but it is

enough in any large aggregate to consume all the profit of insuring lives.

Suppuration of the middle-ear is ushered in by pain, and the severity of this "ear-ache" is at times some measure of the seriousness of the attack. The onset may be insidious or misleading, however, and relief may be sought of the dentist; while in children the fever, delirium or convulsions may draw attention away from the ears. Stains upon the pillow or visible moisture in the canal may be the first indications that the ears are involved. But every such case, however stormy or mild its beginning, may go on immediately or remotely to the worst of issues; and it is our duty to take reasonable precautions from the start, lest we have reason later to reproach ourselves. Mere external protection as by ear-tabs or a night-cap may conserve the recuperative powers; gentle hot douching with clean water may relieve the pain by reducing the inflammatory congestion; and spray and gargling may strike at the root of the trouble in nose and throat. However ill the patient may be in other respects it is mistaken kindness to withhold these simple yet often effective measures of treatment. The tendency is to a "gathering in the ear," which may be watery or mucous or may be purulent and infective. If the simple measures named, with dry heat from a salt-bag or hot water-bottle fail, there is need for surgical aid. Drainage by the natural Eustachian channel can only sometimes be gained; but after good cleansing of the nose and upper throat, it should be gently attempted by the Politzer method or the catheter. Abuse of these means is rightly condemned; so only the expert can maintain his right to use them if ill results follow—in spite rather than because of them. If they fail and the drumhead is seen to be bulging, especially with yellowish fluid, it should be delicately cut along its back margin to furnish a free escape for the collected fluid. If the swelling is marked at its upper portion, the knife should be carried up into this region, coming out in a sweep to the bone along the upper back wall. Free bleeding may be encouraged by warm douching, and is more effective from such a cut than from external leeching; yet since much of the blood-exit from the drum-cavity is along the front wall of the canal, leeching in front of the ear may be almost as good, but should remove not less than four to eight ounces. A wick of gauze or absorbent cotton, dry or moistened with carbolic or boric glycerine, should be inserted deep into the canal and the protective covering replaced. "But if you cut the drumhead you destroy the hearing!" is a fallacy which is still repeated. The opening of the drumhead is a delicate operation, often very painful so as to require ether or other anæsthesia and capable of doing injury to the structures beyond it; but it only forestalls the opening which would occur spontaneously, makes a free and well-placed opening and really saves the drumhead from ulcerating through. Far more important is its influence for good in relieving the injurious pressure in the drum-cavity and it may be really life-saving in preventing fatal extension of the suppuration.

It is impossible to foresee how mild or serious any case is going to prove; and without panicky fighting of shadows, it is only reasonable to

EAR

press home all due precautions. The patient is best in bed, especially if feverish, and all exposure and stimulating diet avoided. Constipation must be relieved, for straining of every sort is not only painful but increases the congestion.

With the opening, artificial or spontaneous, of the drum-membrane, there is generally relief of the pain; yet this is almost sure to recur, especially at night, but with lessening severity, duration and frequency. The fever, which is commonly marked in children, declines and some of the lost sleep is made up. The tension within the drum-cavity is lessened by the escape of the "gathering" and obtains continued relief by the persistence of the discharge. This is thin and bloody at first, then thicker and probably stringy. Its amount is often surprising, so that hourly cleansing is needful, and it may excoriate the skin in and about the canal, calling for protective ointments. The ideal treatment is thoroughly to cleanse before cutting the drumhead and thereafter as frequently as the flow demands to change the sterile wicks of cotton in the canal. If these are prepared by the hundred, each wrapped in a waxed paper and the package of them baked, the patient can readily remove the moist plug and substitute a clean one without contaminating it. Practically, frequent syringing with boiled water at 110° F. or more and a clean soft-rubber bulb better relieves the pain and cleanses the deeper parts of the canal. The heat can penetrate where the water cannot and is the best astringent and stimulant. After two or three weeks the discharge should cease, and another week or two should bring cure; but the cardinal fact in these cases is the infected character of the inflammation, which endangers serious destruction in the drum-cavity and adjacent more vital regions. Often worse than the destruction is the scarring which results from nature's effort at repair. An opening in the drumhead generally heals and may leave no visible scar; in an important minority of cases the edges are skinned over, preventing its closure and grafting skin upon the mucous surfaces within. Nature is prepared to sweep away fluid waste material in the drum-cavity, but skin-flakes forming there are difficult of removal; they tend to collect and by their presence excite more exaggerated scaling. Onion-like masses may thus form, constituting "cholesteatoma" or pearly tumor, and these can do much damage by their pressure as well as maintain or renew the suppuration. The bony walls and the little ear-bones may be destroyed by pressure or decay; and while an exit may thus be made for the cholesteatoma-mass, it too often works inward instead of outward, damaging the labyrinth and may carry the infective process into the brain-case. Just under the thin floor of the drum-cavity is the head of the jugular vein, its intracranial part is equally vulnerable just behind, and an even thinner roof alone protects the brain-membranes above. It is not surprising, then, that symptoms of brain-inflammation are not unusual in ear-diseases; and while these may be merely irritative and transitory, they are at times of deadly meaning. Where the bone suppurates and decays the mastoid-projection just behind the ear is apt to be involved, forming a "mastoid abscess," and may need to be chiseled open to

give exit to the matter and dead bone. Even without this, the inner wall of bone can decay and an abscess-collection form on the outer surface of the brain-membrane. Yet this is strong and firm and may thicken to better protect all within; so such "extra-dural abscesses" have but a fraction of the danger of a collection upon or in the brain itself. Even this can now be often recognized in time by its subnormal pulse and temperature, and located sufficiently by its symptoms to permit of surgical relief; and nearly 80 per cent of the reported operations have been followed by cure. The infection can penetrate the adjacent great blood-vessels and cause clotting within them, with general blood-poisoning and formation of abscesses in the lungs or other parts of the body; but the septic clot can be recognized and safely removed in many cases even when extending down almost to the heart.

Disease of the nervous apparatus of the internal ear is met in hardly 10 per cent of ear-patients. Some of these are due to injury and fracture at the base of the skull, others to cerebro-spinal meningitis or other severe fevers, more still to the extension inward of the catarrhal or the suppurative middle-ear inflammations. Mumps, too, or diphtheria may be followed by sudden total deafness. Inherited syphilis is one of the insidious and slowly acting causes, generally also giving rise to clouding of the cornea of the eye and marked by typical malformation of the second teeth. In any of these conditions the main hope of relief is through the absorption by mercury and iodine of the exuded material, which in the meningitis cases may be in the brain itself and not in the labyrinth. Of notable interest are the cases of "boiler-makers' deafness," as we sometimes call a group of occupation-disorders, usually located in the internal ear, and affecting those subject to persistent clangor—a condition which may compel change of work, if freeing the Eustachian tubes and good plugging of the external canals fails to relieve the advance of deafness. Important too are the cases of vertigo, due to ear-disease. Menière called attention to some of these as caused by labyrinthine apoplexy and they are often called by his name; but the recognizable disease may be of different nature and often is located in the drum-cavity, indirectly affecting the organ of equilibrium in the semicircular canals. Influenza has caused a number of these cases in which the hearing for more or less of the scale has been suddenly lost and the patient made incapable for days or weeks of lifting the head from the pillow. Absorption is here also the best hope; but in some extreme cases advantage has been taken of the damaging effect upon the ear of large doses of quinia, and the irritative condition has been by it changed to a destruction with cessation of the vertigo.

Finally we may mention the brain-affections in which the hearing-centres, especially that for speech, are involved, when we may have "word-deafness," which prevents recognition of the spoken word, although the hearing is perfect for tones of every pitch; for while the ear itself is uninvolved, it is only through ear-examination that one can by exclusion reach a correct diag-

nosis and perhaps point the way for the surgical removal of a brain-tumor.

B. ALEX. RANDALL, M.A., M.D.

Ear Cockle, a disease peculiar to wheat caused by the presence in the grain of worms belonging to the family *Vibria*. In some parts of Europe the disease is known as purples.

Ear-ring, a ring or other ornament for the ear, a hook passing through the lobe, with a pendant of diamonds, pearls, or other jewels, frequently attached. It seems to be in repute among all nations, the most savage as well as the most civilized, and it dates from the most remote antiquity. In Gen. xxiv. 22 we read that Abraham's servant presented Rebekah with an ear-ring, and the same ornament is mentioned in several other passages of Scripture. In the statue of Aphrodite by Praxiteles the goddess was represented with rings in her ears. Among the fine specimens of antique art now extant there are several heads bearing only a single ear-ring on the left ear; and it appears that the Greek children only wore them on the right ear. Ear-rings were not so commonly worn by men as by women, yet, that men did sometimes do so is evident from the fact that the Emperor Alexander Severus thought it necessary to interdict this ornament to men. The ear-rings worn by the ancients sometimes consisted of simple rings, but pendants were frequently attached to them, and these sometimes very heavy. The form of the pendants was various. The Roman ladies used ear-rings of great value. European women, as well as some of the men, wear ear-rings at the present day, although the custom has become almost obsolete in the United States and children's ears are no longer pierced as formerly.

Ear-shell, Sea-ear, Oreille de Mer, names given to any one of the several species of *Haliotis*.

Ear-trumpet, an instrument used by persons partially deaf to strengthen the sensation of sound. The purpose of the external ear, both in men and beasts, is to collect, by its funnel form, the waves of sound, and conduct them to the internal organs, the seat of the sense of hearing. All the artificial instruments, then, ought to resemble in form the natural ear. They are sometimes made like a trumpet of moderate size, the smaller aperture enters the ear, and the wider is directed to the quarter from which the sound proceeds. But these instruments are inconvenient, both on account of their size and the necessity of continually holding to the ear. Ear-

cornets (so called from the French, *corne acoustique*) are applied to the outside of the ear, and kept in their place by a slender steel spring. A small instrument in the form of a scroll, called an auricle is worn inside the ear, the mouth only being visible. Flexible india-rubber tubes, kept open by a spiral wire spring, are among the most convenient forms of ear-trumpet.

Ear-worm. See CORN INSECT-PESTS.

Ear of Dionysius, a famous quarry near Syracuse, in which the slightest whisper was audible at a great distance. It was connected by a secret passage to the palace of Dionysius, the Elder, who died 367 B.C.; also an acoustic instrument with a large mouthpiece to collect the sound, which a flexible tube conducts to the ear. The cave was afterward used as a prison.

Eardley-wil mot, Sydney Marrow, English rear admiral: b. East Sheen, Surrey, 3 Oct. 1847. He entered the navy in 1861, retiring in 1893. He has published 'Life of Vice Admiral Lord Lyons'; 'Our Navy for a Thousand Years'; 'Our Fleet To-day and its Development during the Last Half Century'; 'Our Flags: Their Origin, Use and Traditions.'

Earl, Robert, American jurist: b. Herkimer, N. Y., 10 Sept. 1824; d. there 2 Dec. 1902. He was graduated from Union College 1845, and was admitted to the bar 1848. Elected county judge in 1855 he served two terms and in 1869 was elected to the court of appeals, retiring in 1894. He founded the Herkimer Free Library in his native town.

Earl, a degree of the British nobility between marquis and viscount. The title was made hereditary by William the Conqueror, and for a time was used interchangeably with that of count, the corresponding title on the Continent. The wife of an earl is still called a countess. An earl's coronet is composed of eight pearls raised upon points, with small leaves between, above the rim. Though not of the highest rank earl is the title of highest antiquity in Great Britain. See HERALDRY.

Earl Marshal, the eighth great officer of state in Great Britain, who had, anciently, several courts under his jurisdiction, as the court of chivalry and the court of honor. He is the head of the College of Arms (Herald's College), grants armorial bearings, and determines all claims in connection with them. The office is hereditary in the family of the Howards.

Earle, érl, Alice Morse, American writer: b. Worcester, Mass., 27 April 1853. She was married to Henry Earle in 1874. She has written extensively upon the manners and customs of the colonial period in New England and New York. Her published works are: 'The Sabbath in Puritan New England' (1891); 'Customs and Fashions in Old New England' (1893); 'Life of Margaret Winthrop' (1894); 'Diary of a Boston School Girl' (1894); 'Costumes of Colonial Times' (1895); 'Colonial Dames and Goodwives' (1895); 'Old Narragansett' (1896); 'Curious Punishments of Bygone Days' (1897); 'Colonial Days in Old New York' (1897); 'Home Life in Colonial Days' (1898); 'Child Life in Colonial Days' (1899); 'Stage Coach and Tavern Days' (1900); 'Old Time

EARLE — EARLY

Gardens; Sundials and Roses of Yesterday' (1903).

Earle, Ferdinand Pinney, American soldier: b. Hartford, Conn., 11 Sept. 1839; d. 2 Jan. 1903. He served as a private soldier in the Federal army during the Civil War. In 1889 he was appointed on the staff of Gov. Hill of New York to represent the artillery branch of the State service with the rank of brigadier-general. In 1884 he was decorated by the Venezuelan government with the Order of the Bust of the Liberator as a recognition of services rendered that country.

Earle, John, English ecclesiastic: b. York, England, 1601; d. Oxford 17 Nov. 1665. He was educated at Oxford and after graduation became tutor to Prince Charles and accompanied him in his exile. After the Restoration he was advanced in succession to the offices of dean of Westminster, bishop of Worcester, and bishop of Salisbury. He was the author of several works, the best known being 'Microcosmographie,' one of the "character" books popular in the 17th century.

Earle, John, English philologist: b. Elston, England, 29 Jan. 1824. He was educated at the Plymouth New Grammar School and at Kingsbridge Grammar School in early life, entering Oxford in 1842. He took his B. A. degree in 1845 and was elected fellow of Oriel. Taking the degree of M. A. in 1849, he became professor of Anglo-Saxon, being later ordained deacon. He was presented by Oriel to the rectory of Swanswick 1857; appointed to the prebend of Wanstrow 1871, and became professor of Anglo-Saxon in the University of Oxford 1876. His chief publications are 'Gloucester Fragments' (1861); 'A Book for the Beginner in Anglo-Saxon' (1877); 'English Plant Names from the Tenth to the Fifteenth Century' (1880); 'Anglo-Saxon Literature' (1884); 'English Prose: its Elements, History and Usage' (1890); 'The Psalter of 1539: a Landmark in English Literature' (1894); 'A Simple Grammar of English Now in Use' (1897).

Earle, Mary Tracy, American fiction writer: b. near Cobden, Ill., 21 Oct. 1864. She was educated at the University of Illinois and since 1893 has devoted herself to literary pursuits. She is the author of 'Through Old-Rose Glasses and Other Stories' (1900); 'The Man Who Worked for Collister'; 'The Wonderful Wheel'; 'The Flag on the Hill Top' (1902).

Earle, Mortimer Lamson, American classical scholar: b. New York 14 Oct. 1864; d. New York City 26 Sept. 1905. He was educated at Columbia College; was instructor in Greek at Barnard College for six years beginning 1889, and was then appointed associate professor of Greek and Latin in Bryn Mawr College; 1898 to 1900 was lecturer in Greek at Columbia; and in 1900 was appointed professor of classical philology in Barnard College. Among other literary work he edited Euripides' 'Alcestis' (1895), and Sophocles' 'Oedipus Tyrannus' (1900).

Earle, Parker, American horticulturist: b. Mount Holly, Vt., 8 Aug. 1831. He took up his residence for some years in Illinois and became a trustee of the State University; thence he removed to Mississippi. At the

World's Exposition at New Orleans, in 1884, he superintended the horticultural department, and since 1885 has been president of the American Horticultural Society.

Earle, Pliny, American inventor: b. Leicester, Mass., 17 Dec. 1762; d. there 10 Nov. 1832. In 1785 he became engaged in the manufacture by hand of machine and hand cards for carding cotton and wool, and invented in 1790 a machine for the manufacture of such cards by which the labor of one man for 15 hours could be performed in as few minutes.

Earle, Pliny, son of the preceding, American physician: b. Leicester, Mass., 31 Dec. 1800; d. Northampton, Mass., 18 May 1892. He was educated at the Friends' School, Providence, R. I., and was graduated as M.D. at the University of Pennsylvania in 1837. He was resident physician of the Asylum for the Insane at Frankford, near Philadelphia, 1840-2; physician to Bloomingdale Asylum N. Y., 1844-9; elected professor of materia medica and psychology in the Berkshire Medical Institution at Pittsfield, Mass., in 1863, and was superintendent of the Massachusetts State Hospital for the Insane 1864-1885. In the years 1837-39, 1849 and 1871, he traveled in Europe visiting the most important insane asylums. He is the author of 'Marathon and other Poems' (1841); 'Institutions for the Insane in Prussia, Germany, and Austria' (1853); 'An Examination of the Practice of Blood-letting in Mental Disorders' (1854).

Earlham College, a coeducational institution in Richmond, Ind., founded in 1847, under the auspices of the Order of Friends. In 1902 the school had in attendance 300 students and 21 instructors.

Early, Jubal Anderson, American soldier: b. Franklin County, Va., 3 Nov. 1816; d. Lynchburg, Va., 2 March 1894. He was graduated from the United States military Academy in 1837, fought in the Seminole war (1837-8), and having resigned from the service, entered legal practice at Rocky Mount, Franklin County, Va., in 1838. A member of the Virginia House of Delegates in 1841-2, he was also attorney to the commonwealth in 1842-7 and 1848-52. During the Mexican War he was major (1847-8) of volunteers; and at the outbreak of the Civil War, although strongly opposed to secession, he received the appointment of colonel in the Confederate forces. Promoted brigadier-general for services as a brigade commander in the first Bull Run, he fought with distinction at Williamsburg, the second Bull Run, and Antietam. He was in command of a Confederate division at Gettysburg, and in 1864 of an army for the invasion of Maryland. He crossed the Potomac, defeated Lew Wallace at Monocacy Junction (9 July), threatened an attack on Washington, D. C., but at the arrival of a considerable Union reinforcement, withdrew to the Shenandoah, possession of which he contested with Sheridan, then commanding the Federal army in the valley. On 19 September he was defeated at Opequon Creek, with the loss of 3,000 prisoners and 5 guns, and on 22 September at

EARLY ENGLISH ARCHITECTURE—EARTH

Fisher's Hill, where he lost heavily, and from which point he was driven to the mountains. On 19 October he surprised the Federals in the morning at Cedar Creek, but the tide of victory was turned by Sheridan's arrival from Winchester, and he was completely routed. After his defeat by Custer at Waynesborough (March 1865), he was removed from his command. He attained lieutenant-general's rank. Subsequent to the war he practised law in Virginia, and was, with General Beauregard, a director of the Louisiana lottery. He never took the oath of allegiance. He is ranked high in the list of Confederate officers, and by some authorities was considered not inferior to "Stonewall Jackson." His chief publication is a 'Mémoir of the Last Year of the War for Independence in the Confederate States of America' (1867). Consult 'Battles and Leaders of the Civil War,' edited by Johnson and Buell (1887).

Early English Architecture, the name generally given to the first pointed Gothic used in England. This style of architecture began to be used in England about the end of the 12th century, and lasted for about 100 years. It immediately succeeded the Norman, and finally merged in the Decorated style. It is characterized by long lance-shaped windows, which are often gathered into clusters and enclosed by a large arch, the space between which and the tops of the windows is often pierced with circular, trefoil or quatrefoil ornaments. The molding consist of alternate rounds and deeply cut hollows, separated by small fillets. The doorways are often divided into two by a single shaft.

Earth, The. The earth is at once the subject and the object of many sciences. Of these the most elementary are geography and physiography, which deal primarily with the salient surface features of our planet. Next in order of difficulty are geodesy and geology, which deal more minutely with the shape, the size, the constitution, the mechanical properties, and the material history of the earth. The science of meteorology is concerned with the phenomena of the atmosphere; and our theories of the tides and terrestrial magnetism must be added to the list of purely physical sciences of the globe. All of these sciences are intimately related, and they are sometimes grouped under the single term geophysics. In a broad sense, also, these sciences may be regarded as branches of astronomy, for astronomy is founded on, and hence includes, geophysics. This article is written from the point of view of geophysics and deals especially with the physical and mechanical properties of the earth.

THE SHAPE AND THE SIZE OF THE EARTH.

First Approximation.—The form and the dimensions of the earth have presented a problem of the greatest interest and difficulty to men of science for more than twenty centuries, and they promise to tax the resources of the ablest physicists for some centuries to come. The first approximation to a solution of this problem, of which we have definite record, was made by Eratosthenes of the Alexandrian school of astronomers. Assuming the surface of the earth to be spherical, he measured the length and the angular amplitude of an arc of a great circle

extending from Alexandria to Syene. He observed that at Syene, which is about 500 miles south of Alexandria, the sun shone vertically downwards into deep wells at noon on the day of the summer solstice, proving thus that at that place and time the sun was in the zenith. On the same day at Alexandria he observed, by means of the gnomon, that the sun at noon was south of the zenith by one fiftieth of a circle, or 7.2° . The principles involved in these measurements and in the calculation of the size of the earth are very simple, but they are so fundamental as to justify a full explanation. They assume, first, that the earth is spherical in shape; secondly, that the plumb bob at any

FIG. 1.

point of the earth's surface is directed towards the earth's center; and, thirdly, that the sun is so distant that lines drawn to it from different parts of the earth are sensibly parallel. Thus, in Fig. 1, if A and B indicate the relative positions of Alexandria and Syene and C the center of the earth, lines from A and C to the sun will be parallel; and hence the angle ZAS, or the meridian zenith distance of the sun at Alexandria, will be equal to the angle ACB. Knowing this angle and the distance AB, the rule of three gives the entire circumference.

Second approximation.—No substantial advance beyond this first approximation was made until Newton showed that the gravitation and the rotation of the earth ought to make it somewhat flattened at the poles, or that the surface of the earth should have the shape of an oblate spheroid of revolution. The proof of this theoretical conclusion of Newton constitutes the second approximation to the figure and the size of the earth. Such a figure, however, is much more difficult of measurement than a spherical

FIG. 2.

figure. This is seen by a glance at Fig. 2, representing an ellipse, which, if revolved about its shorter axis PP' , will generate an oblate spheroidal surface. The principles of mechanics

EARTH

show that when such a surface is due to the attraction and the rotation of a fluid mass, the plumb line at any place will not in general point towards the centre of the mass, but will pass somewhat to one side of it, as shown by the line LQ in the figure.

Newton's conception, therefore, involved the difficulties of the more complex spheroidal figure and of the hypothesis that the earth was primitively a fluid mass. Two ways of testing Newton's views were proposed. One was to measure the meridional lengths of a degree of latitude at different places on the earth's surface. If the earth is an oblate spheroid, it is seen from Fig. 3 that the meridional distance along the surface intercepted by two plumb lines which make an angle of one degree (or any constant angle) with each other is greater at the poles than at the equator, or in general, greater in high than in low latitudes. The other method proposed to measure by means of the pendulum the varying acceleration to which a body is subject in different latitudes on the earth's surface. If the Newtonian view is correct, that acceleration, which is the resultant of the effects of attraction and rotation of the earth, and hence the weight of a body, must increase in passing from the equator to the poles.

FIG. 3.

But the Newtonian theory was neither readily accepted nor easily verified. In the early part of the 18th century, in fact, the theory was hotly opposed by the justly distinguished Cassinian school of French astronomers, whose erroneous interpretation of a carefully measured arc of a meridian in France indicated that the earth is an oblong rather than an oblate spheroid. The question was permanently settled by the famous Lapland expedition sent out by the Academy of Sciences of Paris, in 1735, under the auspices of Maupertuis and Clairaut. They proved beyond doubt that the earth's surface is very closely that of an oblate spheroid, thus "flattening the poles and the Cassinis," as Voltaire remarked at the time.

A vast amount of labor has since been devoted to the determination of the dimensions of the spheroid which best fits the earth's surface. This is, indeed, the principal problem of the precise geodesy of to-day. The dimensions of the earth which have been provisionally very generally adopted are those of General A. R. Clarke published in 1866. The theory of a spheroidal surface requires a knowledge of the lengths of the longer and the shorter axes of

the generating ellipse, or equivalent data. Generally the half axes, or the equatorial and the polar radii are given. The values of these are as follows:

Equatorial semi axis = a , polar semi axis = b .
 $a = 20,926,062$ feet = 3,963.3 miles = 6,378,259 meters.
 $b = 20,855,121$ feet = 3,949.8 miles = 6,356,635 meters.

It should not be inferred from these figures that the semi axes are known to the nearest foot or meter. The values given above are those derived from computations carried out to the nearest foot. More approximate values will be determined from computations now in progress, and they may possibly show Clarke's values to be in error by a few hundred feet.

The following derived values appertaining to the earth's spheroid are often referred to:

Equatorial diameter of the earth..... = 7,926.6 miles
Polar diameter of the earth..... = 7,899.6 miles
Difference of diameters..... = 27.0 miles
Circumference of equator of earth.... = 24,902.0 miles
Meridian perimeter of earth..... = 24,859.8 miles

Area of the surface of the earth $\left\{ \begin{array}{l} = 196,940,000 \text{ square miles} \\ = 510,071,000 \text{ square kilometers} \\ = 197 \times 10^9 \text{ square miles (about)} \\ = 51 \times 10^9 \text{ square kilometers (about)} \end{array} \right.$

Volume of earth $\left\{ \begin{array}{l} = 259,880,000,000 \text{ cubic miles} \\ = 1,083,200,000,000 \text{ cubic kilometers} \\ = 260 \times 10^9 \text{ cubic miles (about)} \\ = 108 \times 10^{10} \text{ cubic kilometers (about)} \end{array} \right.$

The following table gives the length of a degree of a meridian in different latitudes; the length of a degree in longitude measured along a parallel of latitude; and the areas of quadrilaterals of the earth's surface of one degree extent in latitude and in longitude. The latitude in the first column of the table is that of the middle point of the corresponding meridional arc or quadrilateral.

Latitude	Length of 1° of meridian	Length of 1° of parallel	Area of quadrilateral 1° × 1° in latitude and longitude
	Statute miles	Statute miles	Square miles
0°	68.703	69.171	4752.3
10	68.725	68.128	4682.0
20	68.786	65.026	4472.8
30	68.879	59.956	4129.6
40	68.993	53.063	3661.0
50	69.115	44.552	3079.2
60	69.230	34.674	2400.5
70	69.324	23.729	1645.0
80	69.386	12.051	836.2
90	69.407	00.000	

From the second column of this table it is seen that the length of a degree of a meridian is about seven tenths of a mile greater at the poles of the earth than at the equator.

Third Approximation.—A third approximation to the figure of the earth may be briefly referred to here. Imagine the mean sea level, or the surface of the sea freed from the undulations due to winds and to tides. This mean sea surface, which may be conceived to extend through the continents, is called the geoid. It does not coincide exactly with the earth's spheroid, but is a slightly wavy surface lying partly above and partly below the spheroidal surface, by small but as yet not definitely known

EARTH

amounts. The determination of the geoid is now one of the most important problems of geophysics. Its solution will be accomplished by means of gravimetric surveys, or by measuring the acceleration of gravity at a great number of points on the earth's surface.

PHYSICAL PROPERTIES OF THE EARTH.

The Atmosphere.—Adopting the convenient terminology of geologists, the earth may be divided into four parts, namely: the atmosphere; the hydrosphere, or oceans; the lithosphere, or crust; and the centrosphere, or nucleus. These are considered in turn without encroaching on the fields of the meteorologist or of the geologist.

The atmosphere is a gaseous envelope covering the earth to an extent not yet fully determined. The pressure it exerts at the surface of the earth is easily measured and is definitely known to be about 14.7 pounds per square inch, or about 1.033 grammes per square centimeter.

The pressure, density, and temperature of the atmosphere are observed to decrease rapidly with increase of height above the earth's surface, but the exact laws of decrease are not yet known. Hence it is impossible in the present state of science to assign a height to the atmosphere. It appears certain, however, that it is more than two hundred miles high, since it is dense enough to set meteorites on fire at that height.

Many investigations of the properties of the atmosphere have been made during the past century. These are all too technical for presentation, even in abstract, here. But their results may be summarized as follows:

(a) If the earth did not rotate and if the atmosphere were of the same density throughout as at the earth's surface, its height would be 26,200 feet, or about 5 miles.

(b) If the earth did not rotate, and if the adiabatic law (pressure proportional to the 1.4 power of the density) held in the atmosphere, it would be about 17 miles high.

FIG. 4.

(c) But the earth rotates and the atmosphere must be supposed to rotate with the same angular velocity. From this fact, and from the assumption that the atmosphere behaves like a fluid, Laplace concluded that it must be limited by a lenticular-shaped envelope as indicated in Fig. 4. The revolution of this figure about the axis LM, which is supposed to be coincident with the axis of rotation of the earth, E, will generate the envelope and the earth in their true relative dimensions. The polar and equatorial axes LM and AB are, re-

spectively, 4.4 and 6.6 times the diameter of the earth. According to this theory, therefore, the atmosphere may be about 17,000 miles high above the poles of the earth and about 26,000 miles high above the equator. The latter limiting height is that at which the centrifugal force due to rotation is just balanced by the attraction of the earth. The volume of the envelope is 156 times the volume of the earth. Whether the atmosphere actually extends to the limits thus defined has not been determined either by Laplace or by subsequent investigators.

A question of great interest is that of the quantity of the atmosphere, since the oxygen thereof is essential to the existence of all higher forms of life on our planet. By quantity is meant the amount of mass of the atmosphere. If the law of distribution of this mass within the Laplacian envelope were known the total quantity could be computed. But that law is not known, and hence it is only possible to attain an approximation, or to set limits, to the actual amount. A lower limit may be found from the adiabatic distribution of (b), above, for a non-rotating earth. This distribution does not differ widely from the actual distribution near the earth's surface; but since it is limited to a height of 17 miles it will give too small an amount. A computation on this basis makes the mass of the atmosphere 1-1170000th part of the total mass of the earth; or, in round numbers, one millionth part of the mass of the earth. This result is also reached, substantially, if it is assumed that the mass of the atmosphere is the same as the mass of a uniform layer of water, or mercury, which would produce the same pressure at the earth's surface. On the other hand, if the adiabatic distribution is supposed to hold within the Laplacian envelope, of (c), above, an upper limit of about 1-1200th of the mass of the earth is obtained. The actual value of the mass of the atmosphere is undoubtedly much closer to the lower than to the upper limit; but how much closer is still a matter for investigation.

The Hydrosphere.—It is well known that about three fourths of the earth's surface is covered by oceans and seas. Precise measures of the relative areas of land and sea are difficult to obtain, and the present state of knowledge does not justify the use of more than three significant figures in defining these areas. The values given below are derived from H. Wagner's 'Lehrbuch der Geographic.' They do not differ widely from the values given recently by other German authorities, though they make the total ocean area about one per cent greater than the earlier estimates of the distinguished British geographer, Sir John Murray. The table below gives the continental areas along with their average heights and the total oceanic area along with its average depth:

CONTINENT	Area in square miles	Average height or depth, in feet
Europe	3,860,000	980
Asia	17,100,000	3,120
Africa	11,500,000	2,130
North America	9,260,000	2,300
South America	6,840,000	1,070
Australia	3,440,000	1,310
Total continental area...	52,000,000	2,300
Total oceanic area.....	145,000,000	11,480

EARTH

The total area of the continents is, therefore, 26.3 per cent of the total surface of the earth; leaving, with the same degree of precision, for the total area of the sea surface 73.7 per cent of the surface of the earth.

The average depth of the oceans according to Wagner is 3,500 meters or 11,480 feet, or, in round numbers, 2.2 miles.

The data thus given show that the volume of the oceans is 315,000,000 cubic miles, or, in round numbers, 1-800th of the entire volume of the earth. Assuming the density of sea water to be 1.03 times that of pure water, and the density of the latter to be 62.3 pounds per cubic foot, the mass in the oceans is found to be 1.49×10^{18} tons of 2,000 pounds, or one and one half million million tons.

It is interesting to contrast this mass of the oceans with the mass of the continents which lies above sea level. The average heights of the continents given in the above table require an average height for the entire land area of about 2,300 feet. This combined with the area of the continents gives for the volume of the continents above sea-level 22,500,000 cubic miles. If to this mass a density of 2.75 times that of water be attributed, the resulting mass of the continents above sea-level is 284×10^{15} tons. This is about one fifth the mass of the hydrosphere, or oceans.

The Lithosphere.—The lithosphere is the special province of the geologist, and is treated in detail under GEOLOGY. It is here considered, therefore, only in its broader physical aspects.

No precise value to the thickness of the shell which is called the crust can be assigned. The estimates of geologists make it 5 to 10 miles thick. It is the shell to which are confined the great rock movements and transformations with the attendant phenomena of crust crumpling, folding and faulting. For the present purposes it may be assumed to be 10 miles thick.

In its mechanical aspects the most important fact presented by the crust is that it rests on the centrosphere, or nucleus, in substantially the same manner as a fluid crust would. In other words, the crust is essentially, in view of the forces to which it is subject, a viscous mass, which may be likened in its behavior to sealing wax. This conclusion is reached when one compares the compression to which the crust would be subjected if it were self supporting, like a dome, with the crushing strength of rocks. That compression is about thirty times the crushing strength of the finest steel and five hundred to one thousand times that of the best building stones. Hence we must infer that at a depth of a few miles there can be no such thing as a cavity in the crust. Another conclusion of great importance, also, is that the surface shape of the earth must conform very closely to the shape it would have if it had been originally fluid, as assumed by nearly all geodesists and geologists, many of whom adduce that shape as a proof of primitive fluidity. Given time enough, and the amount of time available is ample, as seen below, the viscous earth will assume the same shape, essentially, as a fluid earth.

Since the lithosphere, the hydrosphere, and the atmosphere are the theatre of the principal activities, physical and biological, of our planet, it is of interest to know their volume, mass, and chemical constitution. The volume of the shell

10 miles thick below sea level is 1,969,400,000 cubic miles. Adding to this the volume of the crust above sea level, namely, 22,500,000 cubic miles, there results for the volume of crust and hydrosphere down to a depth of 10 miles below sea level, 1,992,000,000 cubic miles. Of this, as stated above, 315,000,000 cubic miles are sea water, leaving for the solid matter of the crust to the depth in question 1,677,000,000 cubic miles. Attributing to this volume a density 2.75 times that of water, the mass of this solid part of the shell is 21×10^{18} tons of 2,000 pounds. This is about 14 times the mass of the oceans. These two masses and that of the atmosphere give, in round numbers, a total of 23×10^{18} tons, the contribution from the atmosphere being taken as 7×10^{15} tons.

CHEMICAL COMPOSITION OF THE LITHOSPHERE, HYDROSPHERE, AND ATMOSPHERE.

ELEMENT	Solid crust	Oceans	Mean, including atmosphere
Oxygen	47.29	85.79	49.98
Silicon	27.21	25.30
Aluminum	7.81	7.26
Iron	5.46	5.08
Calcium	3.77	0.05	3.51
Magnesium	2.68	0.14	2.50
Sodium	2.36	1.14	2.28
Potassium	2.40	0.04	2.23
Hydrogen	0.21	10.67	0.94
Titanium	0.33	0.30
Carbon	0.22	0.002	0.21
Chlorine	0.01	2.07	0.15
Bromine	0.008
Phosphorus	0.10	0.09
Manganese	0.08	0.07
Sulphur	0.03+	0.09	0.04+
Barium	0.03	0.03
Nitrogen	0.02
Chromium	0.01	0.01
	100.00	100.00	100.00

Professor F. W. Clarke, making use of the above data, has worked out the relative abundance of the chemical elements in the combined mass of the atmosphere, the hydrosphere and the lithosphere. His results are given in the preceding table. (See Bulletin of the United States Geological Survey, No. 78.) It is interesting to note that nearly one half of that part of the mass of the earth visible to us is oxygen, the next most abundant contributions being in order, silicon, aluminum, iron and calcium.

The Centrosphere.—Since the crust of the earth, as seen above, rests like a viscous fluid on the centrosphere, the latter, whatever its temperature and other properties, must be subject to great internal stress. Indeed, the mechanics of celestial bodies of large mass leads inevitably to the conclusion that pressure is the dominant factor in the earth at no great depth below the surface. Given time enough, therefore, the distribution of pressure will be essentially the same as if the mass of the earth were fluid. This justifies the application of the laws of hydrostatics to the earth as a whole, whether it was originally fluid or not. With this concept, and with the law of gravitation, several facts enable us to determine within narrow limits what must be the constitution of the earth as regards distribution of density, gravity and pressure. The principal of these facts are (1) the surface

EARTH

density, (2) the mean density, and (3) the surface value of the acceleration of gravity. In addition to these facts, there are some others of less importance depending on the attraction of external bodies on the earth. Laplace correlated all these facts by means of an hypothesis with regard to the compressibility of matter. This asserts that the pressure in the earth increases as the square of the increase in density.

Adopting the indications of Laplace the following table showing the variation of density, acceleration of gravity, and pressure with depth below the surface of the earth has been computed. The relatively unimportant effect of the rotation of the earth is ignored in the calculation. The assumed values of the surface density and the mean density are 2.75 and 5.5, respectively, times that of water. In the third column of the table g represents the average surface value of the acceleration.

DISTRIBUTION OF DENSITY, ACCELERATION, AND PRESSURE IN THE EARTH.

Depth in fractions of earth's radius	Density relative to water	Acceleration of gravity	Pressure in millions of pounds per square inch
0.0	2.75	1.00g	
0.1	3.9	1.04	3.09
0.2	5.0	1.04	7.24
0.3	6.2	1.00	12.42
0.4	7.2	0.94	18.37
0.5	8.2	0.84	24.53
0.6	9.1	0.72	30.61
0.7	9.8	0.55	35.99
0.8	10.3	0.38	40.39
0.9	10.7	0.20	43.04
1.0	10.8	0.00	43.96

It is seen from this table that the acceleration attains a maximum value. This value is 1.05 times the surface value and it is attained at a depth of about 610 miles. At this depth a given mass would have a greater weight than at any other distance from the earth's center. A more extended table, computed by the author from slightly different data, is given in the article on GEOLOGY.

The variation of the density, acceleration and pressure are shown graphically in the following diagram, Fig. 5, in which these quantities are all measured horizontally from the line AO, representing the earth's radius, to the right. The curves have different horizontal scales and are designated, respectively, D.C. (density curve), A.C. (acceleration curve), and P.C. (pressure curve). The pressure curve intersects the axis OQ at right angles at Q.

Another interesting question in this connection is what total radial compressibility is compatible with this Laplacian distribution of density, acceleration and pressure. The answer may be stated in convenient form thus: If the pressure of the atmosphere were to be doubled the radius of the earth would be shortened everywhere by about 2 meters, or 6.5 feet. This explains how mere inequalities in surface loading of the earth may account for some of the great observed movements of the earth's crust.

Acceleration at Surface of Earth.—What is commonly called the acceleration of gravity at the surface of the earth is the resultant of the accelerations due to the attraction and to the

rotation of the earth. This quantity has been measured with considerable precision at various points of the earth's surface by means of the pendulum, and the results have been combined in the following formula, g being the accelera-

FIG. 5.

tion at any point of the sea level whose latitude is ϕ :

$$g = 978.00 + 5.22 \sin^2 \text{ centimeters / (seconds)}^2 \\ = 32.087 + 0.171 \sin^2 \text{ feet / (second)}^2.$$

Mean Density and Mass of the Earth.

Since the volume of the earth is known accurately, the mass can be computed if its density can be ascertained. The author has recently shown (*The Astronomical Journal*, No. 424), that the product of this mean density and the gravitation constant may be derived with a precision comparable to that of the value of the acceleration just given above. The gravitation constant is the quantity essential to convert the proportionality of Newton's law of gravity into an equality. That is, if m and m' are two masses, D their distance asunder, F the force of attraction they exert on one another, and k the gravitation constant, then

$$F = k \frac{mm'}{D^2}.$$

It is thus seen that k is not a mere number, but a quantity such that the second member of the equation is force as well as the first member. k is, in fact, the cube of a length divided by the product of a mass and the square of a time.

Denoting the mean density of the earth by ρ , it is found in the paper referred to that

$$k\rho = 36797 \times 10^{-11} / (\text{second})^2.$$

this quantity being the reciprocal of the square of a time. In a more interesting, as well as a more intelligible, form this relation may be written

$$k\rho = \frac{3\pi}{T^2}$$

where π is the number 3.1415+ and T is the time it would take an infinitesimal satellite to pass around the earth, under the law of gravi-

EARTH

tation, just grazing the equator, if there were no atmosphere to impede its progress. This time is seen to be 1 hour, 24 minutes, 20.9 seconds.

It is clear then that ρ will be given by the above equation if k is known. This quantity has been measured directly by several observers. A mean of the most recent and most trustworthy determinations is, in C.G.S. units. (See 'The Century's Progress in Applied Mathematics,' Science, N. S., Vol. XI.)

$$k = 6673 \times 10^{-11}.$$

Thus ρ is found to be 5.514 times the density of pure water. The uncertainty of this value as shown by the computation is about four units in the last place of decimals. In view of this fact, and of the great difficulties in measuring the quantity k , we shall use the round number 5.5 as hitherto.

From the volume of the earth given above the following results are derived for its mass:

$$\begin{aligned} \text{Mass of Earth} \quad \left\{ \begin{array}{l} = 1.311 \times 10^{21} \text{ pounds} \\ = 6.552 \times 10^{18} \text{ tons (of 2,000 pounds)} \\ = 5.945 \times 10^{20} \text{ kilogrammes} \end{array} \right. \end{aligned}$$

For convenience of reference the masses that have been given above are here collected and expressed in tons of 2000 pounds.

Mass of Earth	= $6,550 \times 10^{18}$
Mass of Centrosphere	= $6,529 \times 10^{18}$
Mass of Lithosphere	= 21×10^{18}
Mass of Hydrosphere	= 1.49×10^{18}
Mass of Atmosphere	= 7×10^{15}

The Internal Heat of the Earth.—That the earth has a great store of heat a few miles below the surface is amply proved by a variety of geological phenomena. Wherever deep wells, or bore holes, have been sunk the temperature is observed to increase with depth at a rate of about a degree F. for 60 feet. This shows that heat is being conducted from the interior to the surface of the earth and is thence radiated into surrounding space. The amount of this heat is sufficient to melt a layer of ice 6 to 8 millimeters (or $\frac{1}{4}$ inch, say) thick, covering the globe, per annum, or more than 800 cubic miles of ice. It seems most probable (though it is by no means certain) that the temperature of the centrosphere is high enough to melt all known rocks, although the lower strata of the crust do not assume the molten or viscid form of lavas except on relief from the great pressure to which they are subject. This was, essentially, the view of Fourier, the earliest physicist to investigate this question, and it is still regarded as the most plausible hypothesis with respect to the actual state of the earth.

Whether this hypothesis is exact or not, however, the theory of heat conduction founded by Fourier enables us to draw with certainty two important conclusions with respect to the earth, namely: (a) that the heat conducted from the interior to the surface escapes as if there were neither atmosphere nor oceans; and (b), that a million years is the smallest unit of time convenient for measuring the historical succession of thermal events.

With less certainty it may be affirmed that the earth is shrinking in bulk as it cools, and that this is one of the principal causes of the grand crust crumplings and volcanic activities to which geologists pay special attention. This cubical contraction goes on exceedingly slowly, however; requiring, so far as one can infer from

present indications, nothing short of thousands of millions of years for its completion.

The Earth as a Time Keeper.—The time of rotation of the earth is the most trustworthy unit of time man has discovered. The present value of this unit is 86164.1 mean solar seconds. That the earth must rotate with great steadiness is at once apparent when the immense amount of its energy of rotation is considered. This energy is about 156×10^{27} foot-pounds, or 2×10^{30} ergs. It is more than will be developed at Niagara (at the present rate of 5 million horse-power, say) in a million million years. Nevertheless, the period of rotation of the earth is subject to variation from four obvious causes. These are (1), secular contraction of the earth's mass; (2), the influx of meteorites, or meteoric dust; (3), tidal friction; and, (4), shiftings in position of the surface load of the earth, as in the processes of sedimentation, glaciation, etc.

The effects of the first two causes have been investigated. ('The Astronomical Journal,' No. 502.) Contraction tends to shorten the day, and may possibly cause a diminution of as much as six per cent of the present length. The change goes on very slowly, however, and will not be perceptible in any such interval as that of human history (20 centuries, say). Meteoric dust tends to lengthen the day; but at the present rate of influx (about 20 millions of meteorites daily) the effect will not amount to so much as a quarter of a second in less than a million million years. During this interval of time the total effect, substantially, from secular contraction will have accrued.

The effects of the other causes named have not been evaluated, though the last one is probably the most important of all of them; since it may be easily shown that such shiftings of the surface load as are now taking place on the earth may modify the length of the day by an amount which, if cumulative, might in a few centuries seriously disturb astronomical reckonings.

President of Carnegie Institution, Washington, D. C.

Earth Currents, a term used in electricity. Telegraph lines and particularly long submarine lines, are constantly troubled by violent electrical disturbances of the nature of transient currents which rush in one direction or the other through the line. The name earth currents is given to these movements of electricity. They are frequently so powerful and so changeable as to render the use of the telegraphic instruments for the time impossible, the earth currents passing so rapidly as to confuse the speaking signals completely. The nature of these disturbances is not thoroughly understood. They are found, however, to be very intimately connected with the perturbations of terrestrial

EARTH CURRENTS — EARTH, INTERNAL HEAT OF

magnetism called magnetic storms, and these, it is well known, are closely connected both with the appearance of the *aurora borealis*, and with the occurrence of the sun's spots. It seems probable that earth currents and the aurora are due to secondary discharges taking place in consequence of alterations in terrestrial magnetism, and that these alterations in terrestrial magnetism are caused by violent solar disturbances.

Earth, Estimated Race Population of the.

The total population of the earth is estimated at 1,440,650,000, divided among the following races: Mongolian, 630,000,000; Indo-Germanic, 545,500,000; negro, 150,000,000; Semitic, 65,000,000; Malay, 35,000,000; Indian, 15,000,000; Hottentot, 150,000. In the world's religions the peoples generally termed heathen have a far larger space, numerically, than all other religions combined. They are as follows: Confucians, 250,000,000; Hindus, 200,000,000; Buddhists, 150,000,000; Mohammedans, 175,000,000; Polytheists, 120,000,000; others, 65,000,000; total, 960,000,000. Christians are as follows: Catholics, 230,000,000; Protestants, 145,000,000; Greeks, 90,000,000; Jews, 9,000,000; and all others 6,000,000; total, 480,000,000. The human family is subject to 48 principal governments. The average duration of human life is estimated at 33 years. The deaths are calculated at 67 per minute, 97,970 per day, and 35,639,835 per year; the births at 70 per minute, 100,800 per day, and 36,792,000 per year. One quarter of the people of the earth die before age 6, one half before age 16, and only one in 100 attains to the age of 65.

Earth-houses, a name generally given throughout Scotland to underground buildings, also known as "Picts' houses" or "Picts' dwellings." The earth-house in its simplest form consists of a single irregular-shaped chamber, formed of unhewn stones, the side walls gradually converging toward the top until they can be roofed by stones of four or five feet in width, all covered in by a mound of earth rising slightly above the level of the surrounding district. In the more advanced form of these structures two or three chambers are found. Earth-houses are frequent in the northeast of Scotland, occasionally 30 or 40 being found in the same locality. Very similar structures, known as bee-hive houses, occur in Ireland. In the United States modern earth-houses are to be found in Nebraska, Kansas, and other Western States, and are commonly called "dug-outs." In Arizona and California certain dwellings of adobe may be designated as earth-houses. See ADOBE.

Earth, Internal Heat of. There is abundant evidence that the interior of the earth is warmer than the surface. All deep mines, tunnels, and borings show a temperature considerably in excess of that which prevails in the shallower strata. At Rosebridge Colliery, near Wigan, England, a temperature of 94° F. was found at the depth of 2,445 feet, although the mean temperature of the surface is only about 49°. We have thus an increase of 45°, which is at the rate of about 1° for every 54 feet of depth. In the Mont Cenis tunnel, at one part where there is a thickness of a mile of rock overhead, the temperature was 85°. The tempera-

ture at the depth of 400 metres in the well of Grenelle at Paris is 75°, the temperature of the superficial strata being about 52°. In a bore through rock-salt at Sperenberg, near Berlin, the temperature at the depth of 3,490 feet was found to be 116°, the mean temperature of the air at the surface being only about 48°. At Yakutsk, in Siberia, where the mean temperature of the air is 13½°, it was found, in sinking a well to the depth of 540 feet, that the soil (which was frozen for the entire depth) increased in temperature by about 1° for every 52 feet of descent.

There is usually a considerable amount of irregularity in the rate of increase at different depths. In a deep boring at Wheeling, W. Va., the increase in the 1,000 feet from 2,375 feet to 3,375 feet is about 13°, while the increase in the next 1,000 feet is more than 16°, the temperature at that depth being 108°. Also, the mean rate of increase is by no means the same at all places, being sometimes as rapid as a degree for every 40 feet, and sometimes as slow as a degree for every 80 feet. Its average value appears to be about a degree (F.) for 50 or 55 feet.

The simplest theory to account for the increase of temperature in descending is that which supposes that the earth has formerly been at a high temperature throughout and is gradually cooling. This theory has been fully developed by Lord Kelvin. Solid rock has greater specific gravity than melted rock, even at the same temperature. Hence, if the earth were originally melted, and were then subjected to loss of heat from its surface, the solid crust which would form would from time to time fall in and allow fresh portions of liquid to come to the surface, until a solid interior had thus been formed, containing perhaps numerous cavities filled with liquid, but having on the whole the characteristics of a solid globe. After this stage a few hundred years would suffice to make the surface nearly as cool as it is at present, although a temperature nearly as high as the melting-point of rock would still exist at the depth of a few feet. The cooling would gradually penetrate deeper, and the rate of increase of temperature with depth would become slower, until, after about 100,000,000 years, this rate would be reduced to the value which it has at present. If we suppose the earth not to have been originally melted, but to have had a temperature considerably below the melting-point, a still shorter period of time would suffice to bring about the present condition of things. Hence Lord Kelvin argued that the age of the earth, as a globe cool enough for habitation cannot be greater than about 100,000,000 years. Professor Tait, on revising the physical data on which this calculation was based, came to the conclusion that the limit must be drawn still closer, namely, at about 10,000,000 years.

It was, until quite recently, maintained by geologists that the solid part of the earth consisted only of a thin crust enclosing a molten interior. This has been disproved by Lord Kelvin, both by the line of argument above sketched, and also by another argument based on the phenomena of the tides. A thin crust enclosing a liquid or pastry interior would yield and change its shape under the action of those forces (emanating from the moon and sun) which produce the tides. Evidently if the sur-

EARTHENWARE — EARTHQUAKE

face and bottom of the sea at a given place rise together and fall together, the depth of water may remain unaltered. The observed effect is the difference between the tide at the surface and the tide at the bottom. Hence the observed effect will be greater with a rigid than with a yielding earth. Now the observed effect agrees with what calculation gives on the supposition that the earth taken as a whole is highly rigid, and is completely at variance with calculation on the supposition that the earth is highly flexible.

Volcanic eruptions have an obvious connection with the question of the condition of the earth's interior. According to one theory they are due to local generation of heat by friction. The outermost layers of the earth have long since attained a nearly permanent temperature. The layers below them are cooling more rapidly, and have therefore a tendency to shrink faster. This tendency finds its relief from time to time in dislocations, which are the source of earthquakes, and which frequently involve the rubbing of one part against another under the enormous pressure of the superincumbent weight. Such friction would certainly involve an enormous local development of heat. See EARTHQUAKE; VOLCANO.

Earthenware, vessels or objects of clay, as distinguished from porcelain, is opaque, as distinguished from stoneware the body is dull and earthy. The clay is baked or fired in a kiln, or more rarely sun-dried. The glaze depends on the quality of the ware; generally it is of a readily fusible character and contains lead; but a simple salt glaze is employed for common articles. Occasionally the unglazed body is employed, as for water-bottles, cream-jugs, vases, and ornaments; these have generally a reddish-brown color, due to iron. The finer kinds of earthenware, such as Majolica, Delft ware, Faience, and Palissy ware, are not only glazed, but are besides elaborately colored and enamelled and ornamented with raised figures of various kinds. See FAIENCE; POTTERY.

Earthnut, a common name for many unrelated plants. The most common are probably the following: *Bunium flexuosum*, and *B. bulbocastanum*, both members of the natural order *Umbellifera*, the latter referred by some botanists to the genus *Carum* (caraway). Certain species of *Carum*, *Enanthe*, and *Cherophyllum* of the same natural order, also bear this common name. All these species are natives of Europe and all bear tubers which have been used to some extent for human food, but are more valued as food for swine, since the animals can be turned loose to root them out of the ground. They are also known as earth chestnuts, pig-nuts, etc. Certain species of *Cyperus* of the order *Cyperaceæ* are also called earthnut (see NUT-GRASS), and so are various species of the natural order *Leguminosæ*, especially *Arachis hypogæa* (see PEANUT), *Apisios*, or *tuberosa* (see GROUND-NUT), known also as wild bean.

Earthquake, a trembling of the earth's crust due to internal causes. It consists of a series of undulatory impulses or elastic waves, transmitted through the rocks of the crust in somewhat the same way that sound is transmitted through the air. These waves are of two classes: (1) compression waves propagated

parallel to the direction of transmission; (2) distortion waves normal to the direction of transmission. The speed with which these waves are transmitted varies greatly. It is greatest near the starting point and diminishes somewhat as the waves die out. The speed is also affected by differences in the elasticity and homogeneity of rock masses. In general it varies from several hundred to several thousand feet per second. The waves of the Charleston earthquake, 31 Aug. 1886 (the data were carefully compiled), had the great speed of nearly 16,000 feet per second. The destructive effects of earthquakes are due to the high velocity of the undulatory impulses rather than to the amplitude of the vibrations since the latter is usually only a very small fraction of an inch and but rarely is as much as two inches.

The violence of earthquakes varies greatly. Delicate instruments, seismographs, constructed to show variations in the stability of the earth's crust, show that the crust is almost continually trembling even in regions where shocks of some magnitude are rarely felt. Earthquakes are sometimes classified as central and linear: in the first the undulatory impulses radiate from a centre of origin or focus in all directions; in the second the strong impulses are felt along narrow strips of the earth's crust. If rocks were of equal elasticity and an earthquake focus were a point, the undulatory impulses would travel outwardly in all directions and at the surface of the earth points equally distant from the focus or seismic centre, would feel the shock at the same moment and the isoseisms or lines drawn through places simultaneously affected would form circles. The point over the seismic centre when the shock is vertical is termed the epicentrum. The results from the study of earthquake data are often variable and puzzling and the determination of the focus is not an easy matter. In general the seismic centre has been found to be not a point but an area and in the case of the Agram earthquake in Hungary (1880), the area must have been large since vertical impulses were felt over a considerable region. It is also known that the seismic centre is very seldom 30 miles below the surface and the commonest depth is 8 or 10 miles. The seismic centre of the Charleston earthquake was at a depth of about 12 miles.

An earthquake tremor may be felt on the surface distinctly and not in the lower levels of a deep mine and *vice versa*. The size of the area when the trembling is perceptible probably bears some proportion to the violence of the initial shock. The great Lisbon earthquake (1755) was distinctly felt from Madeira to Great Britain or over the whole of southwest Europe and northwest Africa. The Charleston earthquake was felt from northern Florida to New England and as far west as Iowa, or over an area approximately 1,000 miles long and 800 miles wide. In the Lisbon earthquake the tremors lasted but about six minutes. In the Calabrian earthquakes (1783-7) the trembling was practically continuous for four years. When an earthquake occurs beneath the sea, the ocean above is uplifted and the shock spreads outwardly in low long waves that travel rapidly but are slower than the earth waves. In mid-ocean such waves are of no importance, but as they approach shore the drag of the sea bottom decreases their speed and length, but greatly increases their height, and

EARTHQUAKES, INSTRUMENTS FOR RECORDING

what are erroneously termed tidal waves result. On a low-lying coast such waves may be very destructive. The explosion of Krakatoa in August 1883 caused sea waves that went around the world at a speed of 400 miles an hour. At distant points like the coast of Europe, the waves were slight, and were detected by tide gauges. On the coast of Java the waves were over 60 feet high and thousands of people were drowned. An earthquake in the North Pacific in June 1896 caused waves 40 feet high along the northern coast of Japan, that did great damage. Over 27,000 people being drowned. Such an earthquake wave on the coast of Peru once picked up a gunboat of the United States navy and left it stranded a mile inland. Earthquakes are usually commonest in regions of present or recent volcanic activity. In the United States they are commonest in California, and in general earthquakes are more often felt near the coasts than inland, just as volcanoes are more often found near the sea. At the same time there is a seismic zone encircling the whole earth in which earthquakes are more numerous than elsewhere, and this zone does not coincide with the distribution of volcanoes. The zone includes Central America, the West Indies, the Azores, Italy, Syria, Persia, Afghanistan, Tibet, Japan, and Hawaii. It is by some regarded as the real earthquake centre, since shocks in regions without the belt are sometimes traced to disturbances within it. Thus the earthquakes of the Mississippi valley (1812) ceased when the volcano of St. Vincent, 2,000 miles distant, burst into activity.

Causes of Earthquakes.—As earthquakes are frequently connected with the eruptions of volcanoes, and are common in volcanic regions, many observers have thought that earthquakes were volcanic phenomena. This view was first expressed nearly 2,000 years ago by Pliny, and during the first half of the 19th century was held by many geologists including von Humboldt. From the fact, however, that many earthquakes in the countries about the Mediterranean, in California, and elsewhere, are not accompanied by any volcanic activity, and since any heavy shock or blow within the earth's crust would be propagated by undulatory impulses to the surface, causing an earthquake, it is now generally recognized that earthquakes are due to a variety of causes. It is plain that some earthquakes are due to the explosions of steam that are the chief characteristics of violent volcanic eruptions. Earthquakes frequently precede volcanic outbursts and cease as the eruption begins. Again it is possible that in regions of present or recent volcanic activity when no volcanic outbreak accompanies or follows an earthquake the latter may have been caused by movements of molten rock deep underground. The sudden expansion of such rock, if pressure were relieved by the opening of some fissure, as in the formation of dikes, might cause a severe earthquake.

Effect of Earthquakes.—Aside from the destruction of life and property the work done by most earthquakes is relatively unimportant. Of geological effects may be mentioned landslides in mountainous regions, as in the earthquakes in 1870 in northwestern Greece. Such landslides may divert the course of streams. Violent

earthquakes are frequently accompanied by the opening of fissures in the ground, which may or may not close again. As noted before, earthquakes frequently accompany the formation of faults. While downward displacements of the earth's crust are of common occurrence, elevations are much less common and some geologists deny that any elevation has ever been observed after an earthquake. See MOUNTAIN; TIDAL-WAVE; VOLCANO, etc.

SAMUEL SANFORD,
Engineering and Mining Journal.

Earthquakes, Instruments for recording.

The first record of an earthquake really worthy of being regarded as accurate and complete was obtained by Professor James Ewing at the University of Tokio, on 3 Nov. 1880, by the aid of a new seismograph of his own invention. This great epoch-making result was dimly foreshadowed, no doubt, by earlier crude attainments, yet Ewing's work was far in advance of that of the times, and his records were the first and only ones from which the approximate amplitudes, periods and accelerations of the motions of the ground could be deduced.

In order that a seismograph may faithfully record the motion of the ground during an earthquake it is in general a necessity that some portion of the instrument must remain relatively at rest throughout the disturbance. Nevertheless, many centuries elapsed in the evolution of seismometry before this primary requisite was clearly perceived, developed and applied. It seems to the writer that to Ewing more than any other is due the credit of having formulated the kinetic basis of all modern seismometry. He was the first to show how to realize and utilize the principle of the steady mass in the measurement of earthquake motion. There is scarcely any type of seismograph now in use that does not find its prototype among the large number of devices and arrangements either described or actually constructed and employed by Ewing at the University of Tokio from 1880 to 1883. We cannot attempt to describe in this brief account any of his early work,¹ or the equally important contributions to seismology by Milne, Gray and others² of that period.

Within the past 10 or 15 years seismographs have multiplied very greatly throughout the civilized world, and by their records it is found that any considerable earthquake literally sets the entire crust of the globe vibrating and its tremors are measurable at almost any point on the surface by the aid of the sensitive instruments now employed.

Nature of Earthquake Motion.—A short statement explaining the motions of the ground will aid in understanding the instruments and their records. The commonly current conception that earthquake motion is a comparatively simple

¹ Memoirs of the Science Department, University of Tokio, No. 9—1883.

² Publications of the Seismological Society of Japan, since 1880.

EARTHQUAKES, INSTRUMENTS FOR RECORDING

vibratory displacement of the ground in some particular direction is shown to be decidedly erroneous by the actual records. The motion, in fact is exceedingly complex; the vibrations in a horizontal plane take place in all conceivable directions and are compounded with motion in the vertical. With this complex sort of vibratory displacements there may also coexist certain twisting and tilting rotations. No single instrument can possibly produce the record of such highly intricate motions. They must be separated or resolved into elementary components for satisfactory registration. It is generally recognized that no less than six distinct and separate components require to be measured, namely, three displacements in directions at right angles to each other, that is, one North and South, one East and West and one vertical; also, three components of rotation about the same three axes. The turning on the vertical axis may be called a twisting component. The turnings on the horizontal axis are tilting effects. Seismologists have not yet succeeded in recording all of these elementary components. Unfortunately most of the instruments thus far employed are influenced by more than one component of motion, and the records cannot therefore be entirely interpreted.

Seismographs—The seismographs chiefly employed up to the present time are those designed to register the horizontal vibratory displacements of the ground. In a limited number of cases efforts have been made to register the vertical component of motion. In still fewer cases the tilting motions of the ground have been the subject of special measurements. The writer is not aware that the twisting component has thus far ever been recorded, although forms of apparatus for the purpose have been proposed.

Vertical Component.—Instruments for vertical motion are not so easy to design, and the results obtained by their use have been less satisfactory than with other types either because the vertical motion of the ground is relatively very small, or because it may be absent altogether. In seismographs for vertical motion the so-called steady-mass must, in general, be suspended by means of very flexible springs, or their equivalents, in order that it may remain at rest in the vertical sense while the ground may rise and fall beneath it. If the springs are too stiff the steady-mass fails to remain at rest but is made to rise and fall with the movement of the ground. On the other hand, if the springs are too weak, very slight variations of strength, due to temperature and prolonged excessive stress, cause the steady-mass to wander slight amounts from its normal position of rest. As the motions are generally greatly magnified, these slight progressive displacements often carry the tracing entirely off the sheet designed to receive it, or otherwise prove fatal to the desired result. These characteristics of ordinary springs constitute serious limitations in the construction of seismographs for vertical motion. What is needed in this connection is some sort of available material for springs that, under very great extension does not exhibit with the lapse of time any minute slow, progressive, after deformations and is unaffected by variations of temperature.

Horizontal Motion.—A simple pendulum consisting of a massive bob, weighing several hundred pounds in some cases, suspended by a steel wire from a massive support has been extensively employed especially in Italy and Spain as the "steady mass" for a seismograph. The motions of the ground with respect to such a mass must be magnified from 10 to 100 or more times if we are to produce satisfactory records of small distant earthquakes. The means of doing this will be shown later.

A simple pendulum of this character fails to provide a reliable steady mass for two or three reasons. If the length is short, 10 or 20 feet, the mass very quickly responds to the earthquake movements and presently the pendulum is itself swinging in a more or less violent manner. A long pendulum (several hundred feet) cannot be supported with sufficient rigidity. The top of a lofty tower, even during the absence of an earthquake, wanders all about a fixed point within it, due to the influence of temperature, wind, etc., on the tower, and the effects of moisture, temperature, rainfall, etc., upon its foundation and the adjacent earth. During an earthquake the motions of the top of such a tower cannot be the same as those of the ground and are doubtless much greater, thereby seriously influencing the steady mass, notwithstanding the great length of its support.

The Horizontal Pendulum.—The type of pendulum employed first by Ewing for the measurement of earthquake motion in the horizontal plane, is commonly called the horizontal or conical pendulum. A modern design of this form of seismograph is shown in Figs. 1 and 2. The steady mass, C, (about 40 lbs.) is supported upon the massive column A by a horizontal strut and the diagonal wires W. W. so that it is exceedingly free to swing about a pivot point at D and another at B. The two points D and B are not quite in a vertical line, hence the steady mass is in slightly stable equilibrium and if disturbed oscillates like a very long pendulum. As ordinarily adjusted at the Weather Bureau the pendulum illustrated, makes a complete oscillation in about 35 seconds. This is equivalent to a simple pendulum about 4,000 feet long. The record is made upon the clock-driven drum R by means of the lever L, carried in the heavy yoke piece G. For this purpose the surface of the drum is closely covered with a piece of smooth white paper which is uniformly coated with soot from a wide-flame, smoky, kerosene lamp. The drum makes one revolution an hour, and each minute of time is electrically marked on the record sheet by the time-ticker magnet M. The distant end of the drum-shaft is cut with a coarse thread which causes the drum to move endwise about 3-16 of an inch with each revolution, thus separating the lines traced by the stylus.

The manner in which the registration of the earth motion is effected is more clearly seen in Fig. 2. The lever L is pivoted very freely in the stirrup F. The short end of the lever is forked and engages the slender steel staff *f*, which is pivoted in the most delicate manner in the frame F, rising from the steady mass C. Observing now that the steady mass is free to remain at rest with respect to the lateral motions of its pier and the yoke piece G, it is plain

EARTHS

that the stylus at the long end of the lever will trace a magnified record of all lateral displacements of the pivot *d*, because the point of the fork which engages the steady mass at *f* must

remain at rest with the mass. The amount of magnification depends upon the ratio of the lever arms. In instruments of the kind illustrated a 10 or 15-fold magnification is usual. Owing to the fractional resistance offered by the soot and at the pivot points greater magnifications require proportionately greater mass in the pendulum, if the same period is retained.

Record of San Francisco Earthquake as made by the Seismograph at the U. S. Weather Bureau, Washington, D. C.

Very similar devices to those shown are quite generally employed in all instruments with mechanical registration.

Two separate pendulums installed at right angles to each other are required to register both components of horizontal motion.

Photographic Registration.—Much less massive horizontal pendulums can be employed to register photographically by the aid of light reflected from a mirror in the usual manner. The Milne seismograph used in the English work records photographically without the use of mirrors. A small steady mass is suspended on a horizontal strut only an inch or two long, but the strut is prolonged beyond by a very light boom to a length of nearly three feet or more. This long boom at the outer end carries a light aluminum vane pierced with a narrow radial slit. The photographic paper, in the shape of a long ribbon is placed in a box just under the vane. The box has a slit in its top at right angles to that in the vane. Light from a lamp is thrown upon the aluminum vane and passes into the box at the point where the two slits intersect, thus making the photographic record.

Magnetographs.—It has been found that the delicately suspended magnetic needles employed for the purpose of recording continuously the small diurnal and other changes going on in the earth's magnetism are nearly always disturbed by even very small earthquakes. These are not seismographs at all, in the ordinary meaning of the word, and the records give very little information except the time at which the needles were disturbed. The needles act like any other small, light pendulum and simply suffer certain mechanical agitation during the earthquake. In some less frequent cases there appear to be certain distinct magnetic effects that occur with the earthquake, but these are only imperfectly understood at the present time.

Interpretation of Records.—Serious compli-

cations are likely to enter into the records of seismographs especially of the horizontal pendulum. This instrument is more and more sensitive to minute tilting motions the greater its period of oscillation. If the ground at the Weather Bureau instrument tilts as little as only one inch in a mile the stylus of the seismograph will be thrown out of line nearly one-quarter of an inch. Furthermore, the instrument is sensitive to the twisting component of motion and finally we cannot feel entirely sure the steady mass has remained quite at rest. If the earthquake motion synchronizes with the free motion of the pendulum, the latter is quite certain to be set swinging. In the face of these complications it is hardly possible, as yet, to exactly interpret the records obtained. Great improvements in the instruments are constantly being made and it appears as if the horizontal pendulums are likely to be displaced in the future by better types of apparatus.

Records.—The interesting features of the Weather Bureau record of the San Francisco earthquake appear in Fig. 3. The small preliminary tremors begin at "a", at 8 h.—19 m.—20 s., A. M., that is 6 mins. 42 sec. after the strong motion recorded at the University of California. The stronger motion begins at "b", on the record at Washington and at 8:32 to 8:35 the pen was deflected off the sheet by the very strong motion, producing a gap in the record which, however, was resumed when the motion subsided a little. The original record sheet is 36 inches long and vibratory motion is perceptible for fully four hours. The complete period of the larger waves was from 20 to 30 seconds. Such vibrations are very slow and appear to be entirely imperceptible to human beings, nor do they affect buildings or other structures injuriously, so far as can be ascertained.

C. F. MARVIN,
Professor of Meteorology, United States
Weather Bureau.

Earths, a term applied by alchemists to substances which were considered elementary bodies, but since the researches of Lavoisier and Sir Humphry Davy, defined as metallic oxides, or compounds of oxygen with metals similar to potassium and sodium. Earths are seldom found in a state of natural purity, but constitute chiefly the component parts of gravel, soil, or strata. The more important earths are divided into two classes; alkaline earths,

lime, baryta, strontia, and magnesia; and proper earths, alumina, zircoma, glucina, yttria, and thorina; most of these are treated under separate titles, to which refer. The alkaline earths resemble the alkalis. They are soluble in water; baryta and strontia readily, lime sparingly, and magnesia very slightly. Their solutions affect vegetable colors similarly to the alkalis. They combine with acids, forming neutral salts, some of which are readily soluble in water, and others insoluble. The proper earths are insoluble and infusible, and by exposure to heat lose the property of easy solubility in acids.

Earthworks, in military parlance, are permanent or temporary defenses chiefly of earth forming a shield against the enemy's fire. For the various forms of military earthworks see **FORTIFICATION**; **TRENCH**.

Earthworm, annelid of the order *Oligochata* (q.v.). Although certain families of *Oligochata* are strictly aquatic and others exclusively terrestrial, still others contain both aquatic and terrestrial species, and aside from peculiarities which are obviously adaptations to the mode of life no sharp distinctions can be drawn between these two classes. The earthworms generally are larger and more robust, with shorter setæ than the waterworms, and have dorsal pores. Within recent years the earthworms have attracted much attention from systematic writers and no less than 800 species, of which upwards of 90 inhabit North America, are now known. Externally they look much alike, but in their internal anatomy exhibit an astonishing variety. The common earthworms of Europe and America, of which a dozen or more species may be found in almost any suitable locality, belong chiefly to the genera *Lumbricus* and *Allolobophora* which have the setæ arranged in four pairs on each somite, a well-developed girdle or clitellum occupying a variable number of segments toward the anterior end, the female and male genital pores on the 14th to 15th segments respectively, and various complex internal peculiarities of the reproductive organs. While our species rarely equal a foot in length, several South African and Australian species reach five feet. Earthworms inhabit nearly all parts of the earth except the frozen regions of high latitudes and altitudes, dry sandy soils, and some portions of the North American prairies. Their habits are everywhere much alike. They burrow in damp earth, which the common kinds penetrate to the depth of about two feet. They swallow the soil, and after digesting its nourishing elements reject the rest in the form of castings from the mouths of their burrows. At night they partly leave their burrows and draw to them the petioles of leaves, etc., on which they feed and with which they close the openings in cold weather. In this way they also seek one another's company and copulate, as hermaphrodites mutually fertilizing each other. A cocoon is formed by secretions of the clitellum and receives the eggs and spermatozoa in a quantity of albumen as it slips past the openings of the genital ducts toward the head, from which it passes and remains in the earth. During the winter they burrow to a depth beyond the reach of frost, but some species at least will survive actual freezing. The importance of earthworms as cultivators of the soil can scarcely be over-

estimated. By their burrowing they render it porous and permeable to the rain and air; they continually turn the earth by bringing up soil from beneath the surface, and they add to its fertility by burying vegetable matter and by their secretions. Darwin has estimated that earthworms bring to the surface in rich meadow lands not less than one fifth inch of soil per annum, and recent laboratory experiments demonstrate most emphatically the beneficial influence on plants of the presence of earthworms. Consult: Beddard, 'Monograph of the Oligochaeta,' and Darwin, 'Formation of Vegetable Mould.'

Earwig, an orthopterous insect, forming type of a family, *Forficulidae*, and an order *Dermaptera*. This insect has generally a habit of concealing itself in cavities, endeavoring to reach their innermost recesses, and in some rare cases may have sought a hiding place in the ear, but its passage into the internal ear would be stopped either by the waxy secretions or by the tympanic membrane. The common earwig (*F. auricularia*) is found throughout Europe, in north Africa, Asia Minor, and North America. It has a length of from two fifths to two thirds of an inch; the antennæ are thread-like, and the number of joints is 15. The fore wings are short, horny, and somewhat rectangular, but the larger hind wings are thin and mainly membranous, and fold up somewhat like a fan under the fore wings. The last segment of the abdomen carries a pair of curved, horny, pincher-like appendages, which in the male are toothed at the base. The eggs are laid in spring, about 20 at a time, and are carefully protected by the female. The young earwigs differ little except in size from the mature insects; they are guarded by the mother during the first period of their existence. Earwigs shun light as far as possible and this habit is taken advantage of by gardeners to catch them and destroy them. In the daytime they may be found in various situations, such as beneath the bark of trees, under stones, in the soil, or in any suitable hole. They feed on fruits, seeds, leaves, and flowers, and at times on animal refuse. Eight other species of this genus are found in Europe. In the genus *Chelidura*, represented in Europe by nine species, the wings are altogether wanting. *Labia* is another genus with only one European species (*L. minor*), which is common in Great Britain about manure heaps and similar habitats.

Easement, a legal term, denoting a privilege comprising a permanent public or personal right as legal owner of one parcel of land, to use, or forbid its use, for some special purpose, with regard to a parcel of land belonging to another owner. This definition includes easements strictly so called, which are always appurtenant to land, public easements, and easements in gross or such as are attached to the person. In more general terms it is said that the right of making use of the land of others, whether it be that of the public or individuals, for a precise and definite purpose, not inconsistent with a general right of property in the owner, especially where it is for the public use, is in legal contemplation an easement or franchise, and not a grant of the soil or general property. In the civil law the land against which the privilege exists is called the servient tenement; its proprietor the servient owner; he

EAST—EAST AFRICA

in whose favor it exists, the dominant owner; his land the dominant tenement. And, as these rights are not personal and do not change with the persons who may own the respective estates, it is very common to personify the estates as themselves owning or enjoying the easements. Easements have these essential qualities. There must be two tenements owned by several proprietors: the dominant, to which the privilege is attached; the servient, upon which it is imposed. Considered strictly, easements exist only in favor of, and are imposed only on, corporeal property. They confer no right to any profits arising from the servient tenement. They are incorporeal. At common law they may be temporary; by the civil law, the cause must be perpetual. They impose no duty on the servient owner, except not to change his tenement to the prejudice or destruction of the privilege. Easements are of various kinds. They are as various as the exigencies of domestic convenience or the purposes to which buildings or land may be applied. The following attach to land as incidents or appurtenances, to wit: The right of pasture on other land; of taking game on other land; of fishing in other waters; of taking wood, minerals, or other produce of the soil from other land; of receiving air, light, or heat from or over other land; of receiving or discharging water over, or having support to buildings from other land; of going on other lands to clear a mill stream, or repair its banks, or draw water from a spring there, or to do some other act involving ownership; of carrying on an offensive trade; of burying in a church, or a particular vault, etc. Some of these are affirmative or positive, that is, authorizing the commission of acts on the lands of another actually injurious to it, as a right of way,—or negative, being only consequentially injurious, as forbidding the owner from building to the obstruction of light of the dominant tenement. Easements of every kind must originate in a grant or agreement, express or implied, of the owner of the servient tenement. By the common law, the evidence of their existence may be by proof of the agreement itself, or by prescription, requiring actual and uninterrupted enjoyment immemorially, or for upward of 20 years, to the extent of the easement claimed, from which a grant is implied. Easements of the negative kind do not admit of possession, and by the civil law they cannot be acquired by prescription, and can only be proved by grant. Use is not essential, therefore, to their existence. Easements may be extinguished by release; by merger, when the dominant and servient tenements are united under the same title and to the same person; by necessity, as by a license to the servient owner to do some act incompatible with its existence; by cessation of enjoyment, when acquired by prescription,—the non-user being evidence of a release where the abandonment has continued at least as long as the user from which the right arose. A shorter time will answer in some cases.

East, Alfred, English artist: b. Kettering, Northamptonshire, 15 Dec. 1849. He studied in Paris at the École des Beaux Arts and under Julian and Bouguereau. He has exhibited at the Royal Academy for many years, and among his works are: 'A Passing Storm,' in the Luxembourg, Paris; 'A Haunt of Ancient Peace,' in the National Gallery of Hungary; 'The Nene Valley,' in the Permanent Gallery of Venice; 'An Idyl of Spring,' in the Preston Gallery.

East. In European countries the East, also called the Orient, signifies the countries of Asia lying east and southeast of Europe. In the western parts of the United States the East is a colloquialism for the region east of the Mississippi River, more especially that north of Maryland and of the Ohio River.

East Africa, British, comprises an area of over 1,200,000 square miles, situated to the north of German East Africa and south and west of Italian Northeast Africa, and extending inland to the Congo State and the Anglo-Egyptian Sudan, but here the boundaries are not definitely settled. It has a coast line of about 450 miles, from the river Umba on the south to the river Juba on the north. This vast region has a population estimated at over 13,000,000, and includes Masailand and the Kenia Uplands, parts of Somaliland and Gallaland, lakes Rudolf and Stefanie, the Albertine head-waters of the Nile, Lake Albert, part of Albert Edward Nyanza, the northern part of Victoria Nyanza, the countries of Uganda, Kavirondo, Unyoro, Ankole, Koko, etc. Great Britain has authority also over the coast islands of Pemba and Zanzibar. In 1888 a charter was granted to a company called the Imperial British East Africa Company, from the initials of whose name the country was for a time called Ibea, and on this body devolved the preliminary work of opening up the whole country. In 1893, however, the company retired from Uganda owing to political and other difficulties, and the protectorate was declared in the following year over that portion of the country. In 1896 this Uganda Protectorate was extended to the neighboring regions of Unyoro, Usoga, Ankole, etc., and the whole district of Uganda is now placed under a commissioner resident at Entebbe, the administrative capital of Uganda. The province of Uganda is recognized as a native kingdom under a "Kabaka." For Europeans and non-natives of the Uganda Protectorate, justice is administered by the British consular courts. Forts have been established at various places, and are garrisoned mainly by Sudanese troops, part of whose duty is to restrain the Unyoro and other peoples from predatory incursions on their neighbor's territory. All the rest of the country, with the exception of the islands of Zanzibar and Pemba, constitutes the East Africa Protectorate, declared in 1895. (See EAST AFRICA PROTECTORATE.) In the interior are many extensive plateaus; the highest mountains of this part of Africa are Mt. Kenia (18,370 feet), Mt. Elgon, and in the extreme west Ruwenzori. The most important rivers are the Nile and its head-waters, with the Tana, Juba, and Sabaki, entering the Indian Ocean. A considerable trade is carried on chiefly with Great Britain and British India. The natives of Uganda and other parts show great skill in various arts, and great

EAST AFRICA — EAST AFRICA PROTECTORATE

capacity for adaption to European conditions and customs. Zanzibar and Pemba are still ruled by a sultan, but form a British protectorate. Some German firms are now in trade here and some trade has been established with Persia and Arabia.

East Africa, German, the German possessions in east Africa, acquired in 1885-90, lying immediately to the south of British East Africa, and having an estimated area of about 400,000 square miles, and estimated population of 4,000,000, of whom 1,000 are Europeans. They are bounded on the north by a line running northwest from the Umba River to the eastern shore of the Victoria Nyanza, and continuing west from this lake to the Congo State. Lake Tanganyika forms the western boundary, and thence a line to Lake Nyassa and the river Rovuma form the southwestern and southern boundaries. In September 1894 it was agreed that the German-Portuguese frontier should follow parallel lat. $10^{\circ} 40'$ S. from the coast to its intersection with the river Rovuma, leaving Kionga and the mouth of the Rovuma to Germany, and Cape Delgado to Portugal. Several stations have been established by the German East Africa Company. A narrow-gauge railway from the coast to lakes Victoria Nyanza and Tanganyika was projected in 1899. The products of the country are coffee, tobacco, cotton, ivory, caoutchouc, and gum. The highest mountain is Kilimanjaro, reaching 19,600 feet. Among the chief rivers are the Rovuma, Rufiji, Kingani, and Pangani, flowing to the Indian Ocean; the Kagera, Shimiya, and Ruwara flowing into Victoria Nyanza; and the Malagarazi flowing into Tanganyika. In the north there are several small lakes, and in the southwest the larger salt lake, Rukwa or Hikwa. On the coast the chief towns are Mikindani, Lindi, Dar-es-Salaam, Bagamoyo, Pangani, Wanga, and the English mission station Saadani. Inland there are Mpwapwa, Kanyenye, Tabora (Kazeh), Urambo, and Ujiji, the last named being situated on the shore of Tanganyika. The country is under an imperial governor.

East Africa, Portuguese. The possessions of Portugal, comprising the three provinces of Lourenço Marques, Mozambique, and Zambesi. Its coast line extends south from Cape Delgado, the southern extremity of the coast-line of German East Africa to Kosi Bay, just below Delagoa Bay, at a point separating British from Portuguese territory, as fixed by the Anglo-Portuguese agreement of 1891; the northern boundary is the river Rovuma, running west from Cape Delgado to Lake Nyassa. The frontier between German and Portuguese East Africa runs along parallel lat. $10^{\circ} 40'$ S. from the coast to its intersection with the river Rovuma, leaving the mouth of the Rovuma and Kionga to Germany, and Cape Delgado to Portugal. The eastern boundary is the lake and British Central Africa, or the Nyassa Protectorate down to the junction of the Shiré with the Zambesi; while from that point the British South Africa Company's territory, including Mashonaland and Matabeleland, and the former South African Republic, form the boundary. Its area is about 3,000,000 square miles; population about 1,600,000. The principal exports are oilnuts and seeds, caoutchouc, and ivory. The Mozambique Company administers Sofala and Manica, the Nyassa Com-

pany has jurisdiction in the northern part between Lake Nyassa, the Rovuma, and the Lurio, and there is also a Zambesia Company. There is a railway from Delagoa Bay to Pretoria, and one from Beira to Fort Salisbury in the Transvaal. The coast-lands are low-lying and not very healthy, but in the region of the Namuli Mountains there is one of the finest and most beautiful tracts of country in the whole continent. There are several important rivers, including the Zambesi, Limpopo, Rovuma, Sabi, Pungwe, Lurio, Mtepewesi, Lukuga, and many others. The most important towns are Lourenço Marques, Inhambane, Sofala, Beira, Quilimane, Chinde, Mozambique, Ibo, Zumbo, Tete, and Sena. Gold is found in the Manica region on the west, and has been worked by British capitalists.

East Africa Protectorate, British possessions in East Africa, extending about 400 miles along the coast north from Umba, at the mouth of the Umba River. The south boundary runs from Umba in a northwest direction to the intersection of the Victoria Nyanza with the first parallel of N. lat., skirts the north shore of the lake, and thence west to the boundary of the Congo Free State. The river Juba begins the north boundary, which from the intersection of the river with the 6th parallel of N. lat. runs to the 35th meridian E. lon., and follows that to its intersection with the Blue Nile; the Congo Free State and the west water-shed of the basin of the Upper Nile forming the west boundary. The total area is about 300,000 square miles, embracing a great part of Somaliland, the Equatorial province, Usoga, Unyoro, etc. It is subdivided so as to consist of seven provinces and a tract of unorganized territory in the northwest. The provinces are under a sub-commission, and are divided into districts and sub-districts. Nandi and Kericho were formerly under the eastern province of Uganda, but 1 April 1902, they were transferred to the East Africa Protectorate. Mombasa is the largest town and the capital of the whole Protectorate. Pop. of Mombasa 27,000. The population of the Protectorate is estimated at 4,000,000. The Imperial East Africa Company opened up the country, having in 1888 obtained a concession of territory from the Sultan of Zanzibar and a charter from the British government. An arrangement for buying them out, was, however, made in 1895. The chief ports are Mombasa, the capital, Lamu, Umba, and Kismayu.

The prevailing religious belief is paganism of some form, but a large number are Mohammedans. A number of Christian missions have been established, and elementary schools founded. Legislation is by ordinances made by the commissioner, the codes of India being followed as far as applicable. The higher courts are at Zanzibar and Mombasa. Slavery is legal on the 10-mile coast strip, but nowhere else under the Protectorate. The principal exports are ivory, rubber, grain, cattle, hides, horns, gum-opal, and fruits. The principal imports are: Manchester and Bombay goods, brass, wire, beads, and some provisions. Trade is chiefly under the control of the East Indian merchants. In 1901 the railroad from Mombasa to Kisumu on Lake Victoria was completed, and other railroads are in process of construction. Post-offices, telegraph lines and other public im-

EAST ANGLIA — EAST INDIA COMPANIES

provements have been introduced and are being extended. See EAST AFRICA, BRITISH.

East Anglia, an ancient kingdom of England, its territory corresponding to what is now Norfolk and Suffolk counties. Redwald was its first historical king (593-615).

East Aurora, N. Y., village in Erie County, on the Western N. Y. & P. R.R., 18 miles south-east of Buffalo. The place is noted as the home of the colony of Roycrofters. (See ROYCROFTERS). It is a residential suburb of Buffalo.

East Cape, the name of the southeastern extremity of New Guinea, in Goschen Strait, and of the most easterly headlands of Madagascar; also on the North Island of New Zealand; also in Siberia, on Bering Strait, in lon. 169° 38' W., in the eastern extremity of Asia. The latter is a bold, rocky promontory, almost cut off from the mainland by swamps and shallow lakes. On the north side is a village, Uedle, of less than 100 huts, with a population of about 260.

East Greenwich, R. I., town, county-seat of Kent County: on Greenwich Bay, and the New York, N. H. & H. R.R. The manufactories are cotton and yarn mills; it has also a large cotton bleachery. Pop. 2,825.

East Hampton, N. Y., town in Suffolk County, in the eastern part of Long Island; on the Long Island R.R., about 122 miles east of New York. The first settlement was made in 1649 and the place was considered as belonging to Connecticut from 1657 to 1664 when it came under the jurisdiction of New York. It was the home of John Howard Payne (q.v.). Pop. 3,800. Consult: Gardner, 'Records of East Hampton'; Hedges, 'History of the Town of East Hampton.'

East Hartford, Conn., town in Hartford County, on the New York, N. H. & H. R.R. The railroad shops and paper-mills give employment to a number of people. Large quantities of tobacco and garden vegetables are raised on the surrounding farms. Pop. 6,500.

East Humboldt Mountains, a range of mountains in Nevada, principally in Elko County. Fremont's Pass is in these mountains. Their slopes have more and larger trees than some of the other mountain ranges in the vicinity.

East India Companies, the various European trading companies chartered by their respective governments for the control of their trade in India and the adjacent countries and islands. From an early period, the Italian republics had established a flourishing trade with these eastern dominions, which was interrupted by the Moslem conquest of Egypt and Constantinople, and the establishment of Turkish rule in Africa and Europe. Under these circumstances arose that spirit of maritime exploration in the 15th century for the discovery of a new passage to the Indies which resulted in the discovery of America by Columbus while seeking a westward route, and in Vasco da Gama sailing around the Cape of Good Hope and reaching the Malabar coast in 1498. This latter discovery gave a new impulse and direction to commercial enterprise and in nearly all the leading nations of Europe, steps were taken to participate in the advantages prospectively revealed in the opening up of this new ocean highway. The 16th century was marked by the Portuguese establishing themselves in India; by English efforts to discover over-

land and northern passages to India, which while fruitless in the latter direction gave rise to commercial relations with the northern coast of Russia; by the union of Portugal and Spain in 1580, and the war with England which closed the Spanish-Portuguese avenues for Indian produce to that country; and by the revolt of the Netherlands against Spanish dominion which gave a parallel check to the Dutch Indian trade. These two latter events compelled Holland and England to seek direct communication with India; in 1582, a Capt. Stephens was the first Englishman to reach India via the Cape of Good Hope, and in 1586 Sir Francis Drake and Thomas Cavendish followed by way of Cape Horn. In the following decade the great historical commercial corporations known as the Dutch and the English East India companies, were organized, and later were followed by Danish, French and Swedish enterprises.

The Portuguese East India Company was organized in 1587, when, owing to laxity in the official management of the trade developed since 1498, it was entrusted to a company of Portuguese merchants in consideration of an annual payment. The company had a turbulent existence, chiefly of conquest by the Dutch until its dissolution in 1640, since when the unimportant Portuguese settlements have been under crown administration.

The Dutch East India Company formed at Amsterdam in 1595 as "a company for remote parts," in 1602 amalgamated with several minor companies and received a charter conferring the exclusive privilege of trade to the East Indies for 21 years, with the necessary civil and military powers. It had a wonderfully prosperous career and its charter was extended to 1644, when French and English competition had made itself so felt that the Dutch company had difficulty in raising the government subsidy for a 21 years renewal of the charter.

The peace of Westphalia in 1648, ensuring the independence of Holland, inaugurated a new era of prosperity; the company colonized the Cape of Good Hope between 1650 and 1670; in 1658 captured Ceylon from the Portuguese; the same year took Formosa, from which they were driven three years later by a Chinese adventurer; in 1663 obtained possession of the chief Portuguese settlements along the Malabar coast, and in 1666 monopolized the spice trade by the capture of Macassar. Their charter was renewed periodically until 1776; in 1781 owing to the expenses of the prolonged struggle against English encroachment, the company had to be assisted with a government loan, and in 1795 the proclamation of the Batavian republic terminated its existence; in 1798 the mother-country assuming the administration of the company's former possessions.

The English East India Company formed in 1599 and chartered by Queen Elizabeth in 1600, under the title of the "Governor and Company of Merchants of London trading with the East Indies," was the most important, commercially and historically of the East India companies. The trading limits assigned by the charter for 15 years were "all the islands, ports, havens, cities, creeks, towns and places of Asia, Africa, and America, or any of them, beyond the Cape of Bona Esperanza to the Straits of Magellan, with the exception of such places as are already in possession of any Christian prince in league

EAST INDIA HOUSE—EAST LIVERPOOL

or amity with the British crown who shall refuse his consent to such trade." The company comprised 125 stockholders, including a governor and 24 directors elected annually to supervise the company's business. The early voyages of Lancaster, Beal, Best and others resulted in large profits; in valuable commercial treaties being entered into with native princes; and in English prestige being considerably enhanced throughout the Orient by naval and political successes over the Portuguese. The establishment of factories in various stations, however, excited the jealousy of the Dutch, who in 1623 massacred the members of the English factory at Amboyna, an atrocity for which Cromwell in 1654 compelled the Dutch government to cede an island and to pay a sum of \$1,500,000 as compensation to the victims' families. This incident inaugurated the struggle which resulted in the loss to the Dutch of all their possessions on the Indian peninsula. With periodical renewals of its charter, the company, overcoming all rivalry and opposition, maintained its position. From 1745 to 1761 it was engaged in a crucial fight throughout the Carnatic for supremacy with the French company established in 1664, and which under La Bourdonnais and Dupleix had obtained almost paramount power in India; Clive (q.v.) brought it safely through the struggle. It was with reluctance, however, that the company accepted the position which their victories over the French and the native states was forcing upon them of territorial magnates, and unconsciously, of founders of the British empire in India; especially when their growing political importance inspired the home government with a desire to control their company.

In 1766 the right of the company to acquire territorial possessions formed a subject of inquiry in the British Parliament; and a year later a resolution of the proprietors to raise their dividend to 12½ per cent was vetoed. The question of the political rights of the company being thus raised, the British ministry acted on their view of it by sending a crown plenipotentiary to India, and after a protracted struggle, a regulating act was passed in 1773 remodeling the powers of the company and placing it under the control of Parliament. The constitution of the councils of the presidencies was regulated and their superintendence assigned to a crown official, Warren Hastings (q.v.) being appointed first governor-general. A further act introduced by Pitt in 1784 modified the political power of the company by a board of control, to superintend, direct, and control all acts, operations, and concerns relating to the civil and military government or revenues of India. From this time the political power of the company was little more than nominal, the right of nominating its officials still remained with the directors, but the absolute right of recall was vested in the crown. The company's charter was renewed with a few changes in 1793 and subsequently at intervals of 20 years; in 1813 they lost the monopoly of the Indian trade, which under certain restrictions was thrown open to all British subjects; their right of exclusive trade was restricted to China, but in 1833 this monopoly was also abolished. Their charter was renewed for the last time in 1853; the Indian mutiny, 1857-8, discredited the company's administration, and in 1858 a proclamation at Calcutta announced that Queen Victoria had assumed the government of

India. The company continued to receive and distribute the dividends guaranteed by the government until the East India Stock Redemption Act became operative in 1874 when the company was dissolved.

The Danish East India Company, founded in 1618, dissolved in 1634, reconstituted in 1670, again dissolved in 1729, was succeeded in 1732 by the Danish Asiatic Company. This company had a prosperous career until the war between Great Britain and Denmark in 1801, when its trade declined and ended with the cession of Tranquebar and Serampore to Great Britain in 1845.

The French East India Company, known as "La Compagnie des Indes Orientales," was founded in 1664 by Colbert, minister to Louis XIV. It had extensive privileges, and in 1675 made a settlement at Surat, and in the following year at Pondicherry. It had a long and prosperous career, notwithstanding the loss of trading privileges at various periods and its connection with the Mississippi Bubble (q.v.). It reached the height of its prosperity under Dupleix and La Bourdonnais (qq.v.), extending its operations until the Deccan and the Carnatic were practically under French control, when antagonism with the English under Clive, the recall of Dupleix, and practical abandonment by the French government, led to the dissolution of the company by royal decree in 1769.

The Swedish East India Company, founded at Gothenburg in 1741, was reorganized in 1806. Consult: Bruce, 'Annals of the East India Company' (1810); Stevens, 'Dawn of British Trade to the East Indies' (1886); Castonnet des Fosses, 'L'Inde Française avant Dupleix' (1887).

East India House, the home of the East India Company in Leadenhall Street, London, well known during the 17th century. Charles Lamb, James Mill, and John Stuart Mill had clerkships at East India House. See **EAST INDIA COMPANIES**.

East Indies, a name given to what was once called the peninsula of Hindustan and Farther India, and includes also the Malay Archipelago. This name was given to distinguish the Indies reached by sailing east from the Indies (West Indies) reached by sailing west.

East Lake, Ala., town in Jefferson County, about seven miles northeast of Birmingham. Howard College was established here in 1841, under the auspices of the Baptist Church. In 1902 there were in this college 10 teachers and 120 students. Pop. 3,150.

East Liverpool, Ohio, city in Columbiana County; on the Ohio River, and on the Pennsylvania R.R., 45 miles west of Pittsburgh. It has freight packet connections with all important Ohio river ports, extensive china, porcelain, earthenware, terra cotta and glass works, foundries, and machine shops. It has the largest pottery works in the United States, natural gas furnishes light and fuel, and the water-works are owned by the city. It has good schools, one business college, three national banks, and daily and weekly newspapers. Under the charter of 1882 the government is administered by a mayor and city council elected biennially. Pop. (1900) 16,485.

EAST INDIAN MANUFACTURES.

EAST LYNNE—EASTER

East Lynne, a novel by Mrs. Henry Wood, which appeared in 1861. It takes its name from the ancestral home of the heroine, Lady Isabel Vane. Several years after marriage, mistakenly doubting her husband's fidelity, she leaves him for another, but later returns in disguise as nurse to her own children, and on her death-bed receives his forgiveness. Although 'East Lynne' has little literary merit, it secured immediate popularity, has been through many editions on two continents, and proved extremely successful as an emotional drama.

East Main, a region of the Dominion of Canada which formerly belonged to the Hudson Bay Territory, but which is now in the Ungava District. It is a bleak and desolate country, yielding little to commerce but fish oil and a few furs.

East Orange, N. J., city in Essex County, on the main line of the Lackawanna R.R., and on a branch of the Erie R.R.; about 12 miles west of New York. It is a residential city, its population being made up largely of people who do business in New York and Newark. The city contains many handsome churches, and private residences, a public library, high and graded schools, a national bank, and weekly newspaper. Pop. (1900) 21,506.

East Providence, R. I., a town in Providence County, on the Seekonk River, and on the New York, New Haven & Hartford R.R. It lies directly opposite the city of Providence. East Providence and the town of Seekonk, Mass., were once a part of the old town of Rehoboth. The town has extensive chemical works, electrical and wire works, bleacheries, linen manufactures, and other industries. The government is administered by a town council, which elects a majority of the local officials. The council members are elected annually by popular vote. The town was incorporated in 1862. Pop. (1890) 8,422; (1900) 12,139.

East River, the strait connecting Long Island Sound and New York harbor, separating the boroughs of Manhattan and Brooklyn. It is about 10 miles long, and is navigable by the largest ships.

East River Bridge. See WILLIAMSBURG BRIDGE.

East Saginaw, Mich. See SAGINAW.

East Saint Louis, Ill., city in Saint Clair County on the Mississippi River and on the Baltimore & Ohio, Chicago, B. & O., the Illinois and other railroads, opposite Saint Louis, Mo., and connected with it by the Eads Bridge. This is an important railroad and industrial center, the converging point of all the railways, 22 in number, entering Saint Louis, Mo.; it is also the great livestock distributing center of the United States, there being large stock yards here, numerous packing-houses and kindred establishments. It also has the largest and most important horse and mule market in the world. As a manufacturing city it contains rolling mills, steel plants, iron works, locomotive and machine shops, glass factories, sugar mills, grain elevators, flour mills and manufactories of various wood products. Seven miles distant are the great fields of Illinois. In public buildings the City Hall, High School, Public Library, Roman Catholic Academy, and Business College are

notable examples. There are three national banks, and one daily and four weekly newspapers. The city has electric light, gas and water works plants and electric street car service, municipal and suburban. East Saint Louis was incorporated as a village in 1861, and as a city in 1865. It expended over \$5,000,000 for public improvements from 1890 to 1900. The city is governed by a mayor and city council, elected biennially. The minor municipal officials are likewise elected by the people. Pop. (1870) 5,664; (1880) 9,532; (1890) 15,000; (1900) 29,655; (1903) estimated 40,000.

JAMES W. KIRK,
Editor East Saint Louis Journal.

Eastcheap, at one time a large market in the east of London. It occupied what is now Billingsgate and Leadenhall market. Several streets or roads converged at the great square, then called Eastcheap. Two of those highways were the old Roman roads which extended northeast and northwest out of the city. Some of the old taverns, notably "Boar's Head," mentioned by Shakespeare and others of the English writers, were at Eastcheap. At the north end of London Bridge there is now a small street called Eastcheap.

Easter, the festival commemorative of the resurrection of Jesus Christ, is called in the Greek and Latin and in the languages derived from them *Pascha*, *Pasch*, *Pasqua*, *Pascua*, *Pâques*, etc., from the Chaldee word *Pascha*, the equivalent of the Hebrew *Pesach*; and that name recalls the act of the Destroying Angel in "passing over" the households of the Hebrews when he smote the Egyptians (Exod. xii.). In languages of Germanic origin the festival has a name *Ostara*, derived from the goddess of spring, in Teutonic mythology. Besides being commemorative of the resurrection of Jesus Christ the Easter festival is a memorial of the Christian passover—of the atonement wrought by the death of Christ upon the cross. At first the Christian passover was celebrated on the same day as the Hebrew, the 14th day of the month Nisan. But before long in the Church of Rome and in other churches of the Latin world, the observance was transferred to the Sunday next after the 14th Nisan; this doubtless primarily to make the difference between Judaism and Christianity.

The churches of Asia and some in the West which were founded by missionaries from the East, were slow to adopt the usage of Rome, and the diversity of usage gave rise to no little controversy; the westerns taunting the easterns with subservience to Judaic custom, and the easterns accusing the westerns of innovation and departure from the ways of Jesus Christ and his apostles. It was not till the year 235 that a general law of the Church was enacted at the Council of Nice prescribing for the universal Church a day for this solemnity. To the bishops of Alexandria was committed in permanence the task of computing for all the churches the time of Easter, that city being the metropolis of science in those times. But the Alexandrine Paschal Cycles fixing the date of Easter for a long course of years were unsatisfactory, being both obscure and incorrect, and hence were not accepted generally; and as a result, in 444, Rome observed 26 March as Easter Day, while Alexandria observed 23 April; and earlier,

EASTER ISLAND — EASTERN QUESTION

in 387 Easter Day in Gaul was 21 March, in Italy 18 April, in Egypt 25 April. The churches in Great Britain and in Ireland were, like those of Gaul and Egypt, at variance with Rome, and from that circumstance has been rashly inferred an Oriental origin of the Gaelic, Scotie, and pre-Saxon British churches: in fact those churches were but adhering to an antiquated rule which they had received from Rome, but which Rome herself had abandoned having reformed her calendar. It was in 669 that Theodore, Archbishop of Canterbury, established the reformed Roman calendar in England. The movable feasts of the Roman Catholic and the Anglican churches are determined by the day of the month upon which Easter Day falls. (See CALENDAR.) The way by which Easter Day is now determined is that of the first Sunday after the paschal full moon (14th day of the calendar moon, or the full moon which happens upon or next after the 21st of March). If the full moon happens upon a Sunday then Easter Day is the first Sunday following.

Easter Island, an island in the South Pacific Ocean, lon. 109° 17' W.; lat. 27° 6' S. The surface is hilly and the soil fertile; yams and sweet potatoes are the principal crops. A number of remarkable sculptures have been found on this island, gigantic stone images. In 1888 Chile took possession of the island, and has since made it a penal settlement. Pop. about 1,500.

Eastern Empire, the ancient empire lasting from 394 A.D. to 1453 A.D., which had its metropolis at Constantinople as distinguished from the western empire with its capital at Rome. It is known also as the Byzantine empire, the Roman empire of the East, and the Greek empire. See BYZANTINE EMPIRE.

Eastern Question, **The**, the name originally given to the diplomatic and national interests affected by the gradual retrocession of the Turkish empire in Europe, and the problem of disposing of the territory thus left, or presumably to be left. Bulgaria, Rumania, Servia, and Greece are the new states which have naturally arisen on the withdrawal of the Turkish power, and their history in connection with the respective policies of England, France, Austria, and Russia toward them is the history of the phases of the "Eastern Question" so far. The Crimean war of 1854-6, with the Treaty of Paris which followed; the Russo-Turkish war of 1877-8, with the Treaty of Berlin; and the Greco-Turkish war of 1897, are among the notable events connected with this subject. British diplomacy on this question has mainly aimed at checking the attempts of Russia to extend her empire and strengthen her strategic position by the absorption of part or all of the territory now belonging to the decaying Turkish empire. Of late years, however, the meaning of the phrase has been much extended, and may now be said to embrace the problem of preventing the aggression of Russia, either in Europe or Asia, from becoming a menace to the authority or commerce of Great Britain. The Russo-Chinese phase of the subject is the most recent one, and arose after the Japanese triumph of 1895 had shown the essential military, naval, and administrative weakness of China. The Turkish atrocities in Armenia showed how jeal-

ous of each other the Great Powers are in connection with these questions.

Whenever any phase of the Eastern question is reopened, all the world is concerned, and Russia becomes particularly interested because the question affects her route to the sea, and what is more her relations with England, the United States, and others of the Great Powers. Austria is concerned because it affects her prospects among the Balkan states. France is concerned because it affects her commercial ambitions in the Orient, her claims in Africa, her route to the East, and the interests of Russia, her great ally. Germany is concerned because of her relations to Russia and France. England is concerned because of Russia and her own life-and-death interests as the maintainer of a world empire in the Suez canal. All the colonial interests in southern Asia and in Africa are concerned. International politics all over the world, whatever the apparent issue and habitat, are resolvable into some form of the Eastern question and stand in sensitive connection with this great political storm centre of the world, the Ægean and the Bosphorus. America is also concerned with the Eastern question in its larger bearings.

The struggle between Occidentalism and Orientalism, and who is to lead as champion of the former, constitutes what may be called the greater Eastern question. When one crosses the Ægean, which is at one part only 100 miles wide, or crosses the Bosphorus which is merely a broad river, deep and rich, flowing down out of the Black Sea, and comes to the shores of Asia Minor, one becomes aware that he has passed out of one world into another world. He has passed out of the Occident into the Orient. The contrast between them, one cannot mistake. The West is full of creation, progress, restlessness, achievement, failure, disappointment, exultation; the East abounds in quietism, resignation, and blissful stagnation. Those are the great outlines of the difference, but they are outlines which force an absolute frontier through life, through the nations of men. Greece stands there at the gateway, and whatever comes from Asia to Europe comes through it. This is the lesson of early European civilization; will, force, empire came down from the North; refinement and civilization moved back in the reverse of their track. The reaction from Alexander's onslaught on the East came late, but it came strong. It came in the form of Islam. Mohammedanism is inspired Orientalism. On came Islam in a mighty tide, seeming, as it were, to have gathered force from the strong impact of Alexander's onslaught a thousand years before, as well as from having been pent up under that tremendous pressure which the Roman empire urged on it for so long. It came on in a terrible tidal wave, swept across northern Africa, across Spain, half across France, all over Asia Minor, up into the map of Europe to the gates of Vienna, and buried old Greece under a terrible slavery for centuries.

That was the reverse tide. The reaction set in long ago. Spain was long since cleansed. The Balkan states have been freed; Greece since the twenties has been free. The Sick Man of Constantinople lingers there by slender footing. He stays where he is by the sufferance of the Powers, or rather as the Persian empire stood — namely, so long as the Greeks could

EASTERN QUESTION

not agree among themselves about the leadership of Occidentalism. That is what we are waiting for now. Who is to be the leader, who is to be the champion of Occidentalism in the 20th century? This is the practical form in which the greater Eastern question is stated to us now.

First of all, Turkey commands our attention. She still sits at the old-time gate by the Bosphorus, and her guns at the fort at Kum Kaleh still command the entrance to the Dardanelles. As a state, Turkey is a heterogeneous assemblage of people under the absolute sway of the sultan. It is a government lacking altogether a sense for the right of a community to choose concerning its own government. It thoroughly represents the Oriental idea whereby government is transcendent, a power above and outside the people, and not imminent, a power within the people. Herein lies the application of the Occidental-Oriental antithesis to political institutions. Turkey, though thoroughly Oriental in its political ideas, maintains its place on Occidental soil because the forces of Occidentalism cannot agree among themselves as to leadership.

Among the various peoples and races whom the fate of history has assigned to Turkish sway are the Armenians. Though their proper district is a province in northeastern Asia Minor, they are found scattered all through the Orient, nearly a quarter of a million of them living in Constantinople alone, and constituting nearly a quarter of its population. The Turkish empire, however, in its lack of sense for what we call distributed government, has no place for their individuality in its scheme. They are to the Turks, as far as they possess individuality and the tendency to use it, simply a plague spot in the empire. Crete is another plague spot on the Turkish map. The population of the island is essentially Greek. Of the quarter million inhabiting it there are perhaps 50,000 Mussulmans, but all speak Greek. Since the 17th century it has been in the hands of Turkey. The insurrection of 1866-8 stirred profoundly the sympathy of Christian people, but the governments of Europe as represented by the Powers insisted, even with a severe menace to Greece, in maintaining the *status quo* of Turkish possession. Repeated insurrections have taken place, notably those of 1891 and 1896; indeed the island has been in a perpetual state of unrest during most of the past century. Various promises of reformed administration have been at different times made by Turkey, but no satisfactory government has resulted. Turkey is unable to administer government. To the Turk the Greek is what the Armenian is—a nuisance. Similar conditions exist in the coast districts of Macedonia and in Epirus, though in the latter the discontent is not so acute or so well formulated. In both, the prevailing population is Greek, and the language, even of the Mussulman, in the latter, Greek. The unnaturalness of the situation teaches that postponement of a settlement can only be temporary. The greatest apprehension attaches to any consideration of any change whatsoever in the existing status. The moment the dismemberment of the Turkish empire in Europe begins, a long list of long-filed claims must be considered. They are unwilling to recognize preferred creditors. Crete, too, lies on

the route to the Suez Canal. It is possible there are other ambitions than those of Greece.

The Greeks are a people that must be reckoned with in the future settlement of Eastern questions. Commercial interests around the entire line of the Ægean are largely in Greek hands. More than one fourth of the population of Constantinople itself is Greek. Now that the Greek state has been created, it constitutes a rendezvous and point *d'appui* for the sentiment of nationality among the scattered millions of Greek blood and language. The Greek nation itself is bankrupt. The land offers no great hope of greatness under present day conditions. It is not suited to agriculture. It has neither water power, minerals in abundance, nor coal supply. But it has an energetic, active, optimistic, though restless and impulsive and, as yet, half-educated people. They are abstemious and thrifty. In foreign lands they accumulate wealth. They are profoundly patriotic. All the traditions of their glorious past are molded into the substance of their modern national life. They are thorough Occidentals, and their antagonism to Orientalism, both in spirit and in the concrete forms of Turkey and Turks, is thorough. The fight with them is on and it will last to the death, because it is grounded in an indestructible difference of thought, mood, and character.

Among the small states of the Balkan peninsula, Bulgaria is now the one developing most rapidly in strength and prestige. She has become the rival of Greece among the lesser states. They both look with greedy eyes toward Macedonia, whose inland population is Slavic, but whose coast population is Greek. Bulgaria is now reconciled with Serbia and Montenegro, and by the formal act of allowing the baptism of the crown prince into the eastern Church sealed her acceptance of Russia's headship. As the Prince of Bulgaria said on the occasion of the baptism, "I turn my face toward the East." All the Balkan states, with the exception of Rumania, have, therefore, now virtually accepted the suzerainty of Russia. Rumania, in her isolation, has re-established friendly relations with Greece.

Austria of all the great powers fears most acutely the reopening of the Eastern question. The Slavic-Balkan states, consolidated now under Russia's protection, interpose between her and the Ægean a solid wall. It has been her eager ambition to secure a port on the Ægean (Salonica), and a right of way to it. She has now no chance. Any dislodgment of conditions in the Orient at this time could bring her no good, and would produce only relative injury.

Germany utilizes her influence as a power apparently in Russia's interest, so far as the Eastern question is concerned. She stands between France and Russia. If both are hostile she is lost. It is, therefore, her policy to trade the interests of the East for Russian favors. The failure of England's effort a year ago to extort reforms from the sultan was due more or less directly to Germany's duplicity. Germany played secretly Russia's game, with the result that Turkey became a province of Russia. This brings us to Russia.

Russia seems to-day the destined possessor. She was once at its gates, and only England's intervention kept her out. England's prestige in the Orient has suffered severe loss by the

collapse of her Armenian policy. Russia has made steady gains. The Slavic-Balkan states are her children, first by natal claims, for she freed them; now by formal diplomatic recognition. They are closing in steadily about Constantinople. Turkey herself has become virtually a Russian province. Russia has besides a natural geographic claim. So great a power as that cannot be cooped up away from the seaboard. The Bosphorus is her natural exit. She is a great world-power, bestriding Europe and Asia. France and China, as well as Turkey, are her allies, almost her provinces. She is immensely strong in her position for diplomatic aggression, because her whole power can be swung by a single hand. Safe in her position, unmenaced from the rear, she has only to bide her time, and as occasion offers to push forward. She is strong furthermore in a certain sympathy her semi-barbarism has with that of the border peoples of Asia. The peoples of the East always prefer the Russian to the Englishman. Russian diplomacy understands the Oriental use of language. Language is used by the Oriental for the purpose of producing kindly feeling or inducing another mortal to see things as you do, but certainly not for the purpose of reporting on objective verities. It is a mechanism for reporting on the greater subjective verities. The Englishman is not liked, though England is everywhere highly respected, feared, and trusted.

Constantinople has been for the last dozen years systematically fortified against the English but not against Russia. A Russian army can enter Constantinople at will. When the question of forcing the Dardanelles with an English fleet was agitated, the English naval authorities estimated that of the 19 ships lying at Salonica, 6 must be sacrificed to do it. The cards have been stacked for Russia. It looks to-day as if the ultimate occupation of Constantinople by Russia were a foregone conclusion. The opening of the Suez Canal has changed things, and as if by jealous interposition of geographic fate, drawn the issue back to the old fighting ground in the eastern Mediterranean. England must, if she is to hold India and Australia, control the Suez Canal and its approaches. England stands in political isolation, a grand isolation, strong not by alliances, but in and by her own intelligence, rectitude, and Anglo-Saxon grit. Within the last five years England has made up her mind that she must be strong enough, if necessary, to face all Europe single-handed. Within that time her navy has been doubled in strength. She is preparing for an inevitable conflict. The conflict concerns this question: who is to be the leader and champion of Occidentalism in the 20th century? Shall it be the Anglo-Saxon or the Slav?

The world is arraying itself in two great camps. Russia spans the north from China to France, and guiding the foreign policy of Germany rules in the last decision northern Asia and all Europe, except England and Italy. England spans the seas and holds in a mysterious bond of common interest and guaranteed justice the diverse elements of her world-empire. Russia's strength has been possibly greatly overestimated. The bonds which hold her empire together might weaken under the testing of adversity. Those which bind the British empire together would strengthen. The financial difficulties which Russia would face in the event

of a great struggle are an element of great weakness in her situation. England's resources are unlimited, infinitely varied and self-supplied. The power of the British empire as it is now organized has never been called to the test. It is no longer a question merely who shall hold Constantinople or who shall control the Suez Canal, who shall command the pass of Thermopylae, or who shall control the oracle of Delphi. It is a larger question, and it concerns larger interests. It concerns the habitable globe.

See BALKANS; DARDANELLES; RUSSIA; SUEZ CANAL; TURKEY, etc.

BENJAMIN IDE WHEELER,
President University of California.

Eastern Rite, Churches of, a name given to various bodies of Eastern Christians who are members of the Roman Catholic Church, but who have been permitted to retain many of their ancient customs, which differ from those in general use throughout the world. The Armenians, Copts, Greeks, Maronites, and some others belong to the Eastern Rite. They differ from the Latin Church in nothing doctrinal, only in some matters of discipline. Their liturgy is in the language first used by their bishops and priests, and in no case is the Mass said in their vernacular of to-day. For instance, the Syrians use now the Arabic language (in some places modified) but the Maronite liturgy is in the old Syriac language, as used at the time of Christ. (See MARONITES.) They differ as to the manner of administering communion; some using for consecration only the leavened bread, others only the unleavened, and some giving communion to the laity under the form of both bread and wine, others using only one of the species as in churches of the Latin Rite. The discipline of marriage for the clergy differs from the Latin Church. Candidates for the priesthood may marry before becoming deacons, not after. All points of difference between the Eastern and Latin Rites are of discipline, not of faith.

Eastern Shore, a name given to all that part of Maryland lying east of Chesapeake Bay, and also the counties of Accomac and Northampton in Virginia. Delaware is sometimes included in the Eastern Shore. The country is noted for its fruit and for its mild climate. Great quantities of oysters are taken annually from the waters of the Eastern Shore lands.

Eastern Star, Order of the, a secret society composed exclusively of Freemasons in good standing, and their wives, mothers, sisters, and daughters, and the widows of Freemasons. The order originated in New York 1868. In 1904 there were 44 grand chapters in as many States, and nearly 297,116 members. Its rites and services are conducted with all the impressive se-

EASTERN STATES — EASTMAN

crecy peculiar to Freemasonry. A five-pointed star, between whose points the word "Fatal" is inscribed, is the badge of the order.

Eastern States, in popular parlance, the six New England States — Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut; in the Mississippi valley the inhabitants refer to the Eastern States as that section lying east of the Alleghany Mountains.

Easthampton, Mass., town in Hampshire County; on the New York, N. H. & H., and the Baltimore & M. R.R.'s; 12 miles northwest of Springfield. The chief manufactures are cotton goods, yarns, buttons, shoe-web, rubber and elastic goods. Williston Seminary, a preparatory school for boys, is located here. Easthampton was settled in 1665; and on 13 May 1704 an Indian attack upon the settlement resulted in 19 killed and much loss of property. Three villages are included in the town of Easthampton. Pop. 5,700.

Eastlake, Sir Charles Lock, English artist: b. Plymouth 17 Nov. 1793; d. Pisa, Italy, 23 Dec. 1865. He entered the schools of the Royal Academy, where Haydon supervised his education. In 1816 he went to Italy, and for 14 years his home was at Rome, his Italian life being broken by visits to England and Greece. Pictures of banditti and other subjects exhibited in England procured him the associateship of the Academy in 1827. 'Pilgrims Arriving in Sight of Rome' (1828) became so popular that the artist became tired of repeating it in different versions. In 1830 he was made an R.A., his diploma picture being 'Hagar and Ishmael,' 'Escape of Francesco Carrara' (1834); 'Gaston de Foix' (1838); 'Christ Blessing Little Children' (1839); and 'Christ Weeping Over Jerusalem' (1841), were next among his noteworthy productions. 'Helena' (1849); 'Ippolita Torelli' (1851); 'Violante' (1853); may also be mentioned. He translated Goethe's 'Theory of Colors' (1840), and published in 1847 'Materials for a History of Oil-painting.' He became president of the Royal Academy in 1850, being knighted on the occasion; was keeper of the National Gallery in 1843-7, and director of the same institution from 1855 onward.

Eastlake, Charles Locke, English art critic: b. Plymouth, England. He studied in the Royal Academy schools, but subsequently devoted himself to literary work and design, and was keeper and secretary of the National Gallery 1878-98. He has published: 'History of the Gothic Revival in England' (1871); 'Hints on Household Taste' (4th ed. 1874), a book which exerted much influence in its day; 'Lectures on Decorative Art and Art Workmanship' (1876); 'The Present Condition of Industrial Art' (1877); 'Our Square and Circle' (1895); 'Pictures at the National Gallery' (1898).

Eastman, Charles Alexander, American homœopathic physician, and author: b. Redwood Falls, Minn., 1858. His father was a Santee-Sioux Indian, Many Lightnings (Jacob Eastman), and his mother a half-breed Sioux, Nancy Eastman. He was graduated at Dartmouth College 1887, and at the Boston University School of Medicine 1890. He married the poetess, Elaine Goodale, 1891. He served as government physician at Pine Ridge Agency 1890-3, being Indian secretary of the Y. M. C. A. 1894-7. He

acted as attorney for the Santee Sioux at Washington 1897-1900, later becoming government physician at Crow Creek, South Dakota. He published 'An Indian Boyhood: or Recollections of a Wild Life' (1901).

Eastman, Charles Gamage, American poet: b. Fryeburg, Me., 1 June 1816; d. Burlington, Vt., 1861. He published (1848) a volume of 'Poems' descriptive of rural life in New England, and edited the Vermont *Patriot* at Montpelier from 1846 until his death.

Eastman, Charles Rochester, American palæontologist: b. Cedar Rapids, Iowa, 5 June 1868. He was graduated at Harvard University in 1890. Subsequently he served on the United States and Iowa State geological surveys; and was an instructor in geology and palæontology in Harvard and Radcliffe colleges. He afterward took charge of the department of vertebrate palæontology in the Agassiz museum at Harvard. He published an English translation of Von Zittel's 'Palæontology' (1901). In 1901 he was tried for the murder of his brother-in-law, and acquitted.

Eastman, George, American inventor: b. Waterville, Oneida County, N. Y., 12 July 1854. As an amateur photographer in Rochester, N. Y., he turned his attention to the production of dry plates, which achieved an instantaneous success. In 1881 the Eastman Dry Plate Company was organized, which developed later into the Eastman Kodak Company. Eastman companies have also been established in London, Paris, Berlin, and elsewhere, and the business has now reached vast proportions.

Eastman, Harvey Gridley, American educator: b. Marshall, N. Y., 1832; d. 1878. In 1859 he founded the Eastman National Business School at Poughkeepsie, N. Y.

Eastman, John Robie, American astronomer: b. Andover, N. H., 29 July 1836. He was graduated at Dartmouth College in 1862; and became assistant in the United States Naval Observatory. In 1865 he was appointed professor of mathematics in the navy. He has been a member of several astronomical expeditions in the United States, and accompanied one to Sicily in 1870. Most of his observations, computations, and researches appear in the annual volumes of the 'Naval Observatory,' which, in 1872-82, were edited by him.

Eastman, Julia Arabella, American writer for juveniles: b. Fulton, N. Y., 17 July 1837. Among her writings are: 'Short Comings and Long Goings' (1869); 'Beulah Romney' (1871); and 'Young Rick' (1875).

Eastman, Joseph, American physician: b. Bleeker Mountains, Fulton County, N. Y., 1842. He learned blacksmithing, served for a time as a private in the Federal army during the Civil War, subsequently studied medicine, and has long been prominent as a physician in Indianapolis, his specialty being abdominal and pelvic surgery.

Eastman, Mary Henderson, American prose writer: b. Warrenton, Va., 1818. She has published: 'Dacotah or Life and Legends of the Sioux' (1849); 'Romance of Indian Life' (1852); 'Tales of Fashionable Life' (1856); and many stories and sketches.

EASTON

Easton, Morton William, American philologist: b. Hartford, Conn., 18 Aug. 1841. He was graduated at Yale in 1863, and at Columbia in 1866, and afterward studied at the University of Vienna. He was for several years professor of comparative philology in the University of Tennessee, and later in the University of Pennsylvania. He has contributed numerous papers on Phonetics, Sanskrit, Iranian, and English to 'The Journal of the American Oriental Society,' 'The American Journal of Philology' and other periodicals.

Easton, Nicholas, American colonial statesman: b. Wales 1593; d. Newport, R. I., 15 Aug. 1675. Emigrating to America in 1634 he was the first settler in Agawam, now Newbury, Mass., 1635. He built the first English house in Hampton, N. H., 1638, and the first one on the site of Newport, R. I., 1639, and was elected president of Providence Plantations 1649 and 1654. He was deputy-governor of Rhode Island for four years, and governor 1672-5. His son, John Easton, was governor 1690-5, and wrote a 'Narrative of the Causes which led to King Philip's War,' edited by F. B. Hough, Albany, 1858.

Easton, Mass., town in Bristol County, on the New York, N. H. & H. railway, about 25 miles south of Boston. The town includes several villages, and has important manufactures of shovels, thread, foundry and machine-shop products, hardware, automobiles, shoes, shoe heels, and wire. It has public library and high school buildings, churches, and several banks. Pop. (1890) 4,493; (1900) 4,912.

Easton, Md., town, and the county-seat of Talbot County; on the Philadelphia, W. & B., and the Baltimore, C. & A. railways; about 28 miles southeast of Annapolis; 50 miles south-southeast of Baltimore; near a navigable inlet of Chesapeake Bay. It is the seat of a Protestant Episcopal bishop and has a fine county-building, high school, churches, etc. It is the market centre for a rich grain and fruit-growing country. The manufactures are chiefly iron machinery, fertilizers, carriages, wagons, handles and spokes, lumber, brick and tile, flour, canned fruits, furniture, and shirts. Pop. (1890) 2,939; (1900) 3,124.

Easton, Pa., city, county-seat of Northampton County; on the Delaware at the confluence of the Lehigh River; on the Pennsylvania, the Lehigh V., the Central of N. J., Delaware, L. & W., and other railways; 75 miles southwest of New York, and 67 miles north of Philadelphia. It has water communication with Newark and New York by the Morris and Essex Canal, and with Philadelphia and the coal regions by the canals of the Lehigh Coal & Navigation Company. The city is picturesquely situated in a deep valley surrounded by rugged hills. The older part, near the rivers, is regularly laid out, with a public square at the intersection of the two principal streets in which a daily market is held. Many of the buildings in this section antedate the revolutionary period; the newer residence portions are built on the surrounding hills. The scenery of both the Delaware and Lehigh valleys is of unusual beauty. Handsome bridges

for railway and general traffic connect the city with Phillipsburg, N. J. (q.v.) on the opposite side of the Delaware and with the former South Easton across the Lehigh, now a part of Easton. It has many fine residences, business buildings, churches (in some of which service is held in the German language), public schools, a large high school building, a public library, opera house, etc. Paxinosa Inn is a well-known summer hotel on the summit of Chestnut Hill (about 900 feet) north of the city. Lafayette College (q.v.), founded in 1832, with its beautiful grounds and buildings overlooks the city from a high bluff, approached by stairways and winding driveways.

Industries, etc.—The census of 1900 returned 285 manufacturing establishments, with \$4,829,879 combined capital; 3,912 employes; paying \$1,516,525 annually in wages; using \$3,794,496 in materials; and with an annual product valued at \$6,746,078. An abundance of iron ore and fluxing limestone in the vicinity, and its proximity to and easy communication with the anthracite coal-fields, have from an early date made Easton an important centre for the manufacture of iron. It has several large blast-furnaces, rolling mills, foundries, and manufacturing of sheet-iron, wire, and wire rope. Slate, building stone, burning lime, and talc are quarried extensively, and in recent years Easton has come into importance as the jobbing and distributing centre for the great New Jersey-Pennsylvania cement belt, some of the largest cement works in the world being within a few miles radius of the city. It has extensive silk mills, and manufactures of compressors and drills, railway supplies, chemicals, boots and shoes, and organs; flour, saw and planing mills; furniture factories, machine shops, etc. Easton has good banking facilities, daily and weekly newspapers, and an extensive local and general trade.

Government, Public Service, etc.—The mayor and city council, which consists of two houses, are elected for three years. The mayor makes the appointments to the board of health and the fire department, subject to the approval of the council, who elect the city engineer. The city treasurer is chosen by popular election. Easton operates its own electric lighting plant. It has good gas and electric service, high-pressure water service, supplied largely by spring water, and sewers. It has good local street railway service, and is connected by electric railway with Philadelphia (two lines, Bethlehem, Allentown, Nazareth, and the slate and cement region along the southern slope of the Blue Ridge Mountains, near the Delaware Water Gap.

History and Population.—Before and during the War of Independence "the forks of the Delaware" was an important outpost. Here in 1744 David Brainerd (q.v.) began his missionary labors among the Indians. The city was laid out in 1750, became a borough in 1789, and was chartered as a city in 1887. South Easton was annexed in 1898. In 1756, 1757, 1758, and 1761 important conferences were held here with the Indians and treaties made. General John Sullivan (q.v.) set out from here in 1779 upon his expedition against the Iroquois. The Reformed Church in North Third Street was the scene of one or more of these Indian confer-

EASTPORT — EATON

ences; and was used as a hospital by the patriots during the War for Independence; and at the corner of Ferry and Fourth streets stands the home of George Taylor, a signer of the Declaration of Independence. Population, largely of German descent, (1890) 14,481; (1900) 25,238. Consult 'The History of Easton,' Condit.

Eastport, Maine, city and port of entry in Washington County, on Moose Island, in Passamaquoddy Bay, and on the Washington County Railway: 190 miles east-northeast of Portland. A bridge crosses the narrow channel to the mainland. It is the northeast frontier city of the United States, and has a fine harbor, which on account of its high tide, 25 feet, is clear of ice all the year, and has daily steamship service with Boston, Calais and Portland. Eastport and the island of Campobello, on the opposite side of the harbor, are popular summer resorts. The city has extensive fishing and ship-building interests, and is the centre of the American sardine-canning industry, with 20 factories. It also manufactures shoes, box shooks, etc. It has a custom-house, public library, the Boynton high school, churches, national and savings banks, weekly newspapers, and is lighted by electricity. Eastport was settled about 1782. The islands in Passamaquoddy Bay were long under dispute and claimed by Great Britain. The town was captured by an English force 11 July 1814 and held for four years. It was known for its smuggling industry which flourished in the years immediately preceding and following the War of 1812. Pop. (1890) 4,908; (1900) 5,311. See Kilby, 'Eastport and Passamaquoddy.'

Eastward Ho! a comedy written by Marston, Chapman, and Johnson, and produced in the season of 1604-5. It is best known for its satire on the Scotch, which caused the imprisonment of its authors.

Eastward Position, the position assumed by many clergymen of the Anglican Church during part of the communion service, the clergyman being placed in front of the communion table with his back to the congregation. This position has been a cause of much controversy. It was decided, in 1870, that such a position during the prayer of consecration is illegal; but if the "manual acts" of the priest are visible, the position appears to be legal by a decision of 1891.

East'wick, Edward Backhouse, English Orientalist and diplomatist: b. Warfield, Berkshire, 13 March 1814; d. Ventnor, Isle of Wight, 16 July 1883. He was a voluminous writer on Oriental (especially East Indian) subjects, and rendered very important service to English literature by many translations from Persian and Hindu, for example: Sadi's 'Gulistan,' or 'The Rose Garden' (1852); and the version of Pilpay's fables called 'Anvār-i-Suhaili' (1854). He also wrote a 'Journal of a Diplomat's Three Years' Residence in Persia' (1864); and 'Venezuela,' or 'Sketches of Life in a South American Republic' (1868). Between 1878 and 1882 he brought out a sumptuous edition of the 'Kaisar-nama-i-hind,' or 'Lay of the Empress.' He was a frequent contributor to literary journals.

Eaton, Amos, American scientist: b. Chat-ham, N. Y., 1776; d. 1842. He was graduated

at Williams College 1799; settled in Catskill, N. Y.; practised law, and engaged in civil engineering, while prosecuting studies in chemistry, geology and mineralogy. He made a survey of Albany and Rensselaer counties 1820, and later of the Erie Canal region. Among his works are: 'An Index to the Geology of the Northern States' (1818); 'A Manual of Botany of North America' (1833); and 'Geological Note-Book' (1841).

Eaton, Amos Beebe, American army officer: b. Catskill, N. Y., 1806; d. 1877. He was graduated at West Point, served on the northern frontier, and after 1838 served in the Department of Subsistence in Florida, New York, etc. He was chief commissary of subsistence under Gen. Zachary Taylor in the Mexican War, and received the brevet of major in 1847. He served as purchasing commissary at New York during the Civil War, was made commissary-general of subsistence in 1864, and was brevetted major-general 1865. He was retired in 1874.

Eaton, Arthur Wentworth Hamilton, Canadian writer: b. Kentville, Nova Scotia. He was graduated from Harvard in 1880, entered the Episcopal ministry, and was rector of St. Andrew's Church, Chestnut Hill, Mass., 1885-7. Since 1888 he has been an assistant master in the Cutler school for boys in New York. He is the author of 'The Heart of the Creeds: Historical Religion in the Light of Modern Thought' (1888); 'Arcadian Legends and Lyrics' (1889); 'Letter Writing: Its Ethics and Etiquette' (1890); 'The Church of England in Nova Scotia, and the Tory Clergy of the Revolution' (1891); 'Tales of a Garrison Town' (with C. L. Betts) (1892); 'College Requirements in English' (1900).

Eaton, Charles H., American Universalist clergyman: b. Beverly, Mass., 15 Aug. 1852; d. Tryon, N. C., 14 April 1902. He was graduated at Tuft's College in 1874, and at Tuft's College divinity school 1877. He was ordained at Palmer, Mass., 1877; and in 1881 became pastor of the Church of the Divine Paternity in New York 1881, succeeding Rev. E. H. Chapin.

Eaton, Charles Warren, American artist: b. Albany, N. Y., 22 Feb. 1857. He studied at the National Academy of Design, and the Art Students' League, New York, and in London; and is a member of the American Water Color Society, New York. He exhibited at the Paris Exposition 1900.

Eaton, Daniel Cady, American botanist: b. Fort Gratiot, Mich., 12 Sept. 1834; d. New Haven, Conn., 29 June 1895. He was a grandson of Amos Eaton (q.v.): was graduated at Yale College in 1857, and professor of botany there 1864-95. He accompanied the government expedition to the Wasatch Mountains in Utah. His best-known publications are 'The Ferns of North America'; and 'Ferns of the Southwest.'

Eaton, Dorman Bridgman, American lawyer: b. Hardwick, Vt., 27 June 1823; d. New York 24 Dec. 1899. He was graduated at the University of Vermont in 1848, and at the Harvard Law School in 1850; was admitted to the New York bar; and later became widely known by his advocacy of civil-service reform. In 1883

he was appointed a commissioner of the United States Civil Service Commission, resigning in July 1885. He was reappointed in November of the same year, but again resigned in April 1886. In the latter year he drafted the laws which created the Metropolitan Board of Health of New York; subsequently those on which the present police courts were organized; and in 1883 the National Civil Service Act. His publications include: 'The Independent Movement in New York' (1880); and 'Civil Service in Great Britain' (1880).

Eaton, John, American educator: b. Sutton, N. H., 5 Dec. 1829; d. Washington, D. C., 9 Feb. 1906. He was graduated at Dartmouth College in 1854; studied theology; and in 1862 became chaplain of the 27th Ohio Volunteer infantry. Subsequently he was appointed superintendent of freedmen for Mississippi, northern Louisiana, Arkansas, and west Tennessee, and remained on duty till May 1865. He was brevetted brigadier-general of volunteers in 1865. In 1871-86 he was commissioner of the United States Bureau of Education; in 1895 became president of Sheldon Jackson College at Salt Lake City; and in 1898 was appointed a special commissioner to arrange for the establishment of the American system of education in Porto Rico. His publications include: 'History of Thetford Academy'; 'Mormons of To-day'; 'The Freedmen in the War' (report); 'Schools of Tennessee' (report); and reports of the United States Bureau of Education.

Eaton, John Henry, American statesman: b. Tennessee 1790; d. 1856. He practised law in Nashville, and was secretary of war 1829-34, when he became governor of Florida. He was appointed minister to Spain 1836, and published a 'Life of Andrew Jackson' (1824).

Eaton, Margaret O'Neill ("PEGGY O'NEILL"): b. Washington 1796; d. 1879. As the wife of Major J. H. Eaton, Jackson's secretary of war, she was the subject of a social war in government circles owing to certain charges connecting her name with that of Major Eaton, while she was still wife of purser Timberlake, her first husband. It was said that from this social disturbance arose an estrangement between Gen. Jackson and Calhoun, leading to the nomination of Van Buren for the presidency 1836. After the death of her second husband she married a third, an Italian dancing-master, much her junior, from whom she was divorced.

Eaton, Seymour, American editor and author: b. Canada 1859. He served for five years as director in the Drexel Institute, and was director of the Home Study Circle of the Chicago *Record* for several years. He is widely known as the founder and president of the Book-lovers' Library. Among his works are: 'Business Forms'; 'How to do Business'; 'The New Arithmetic.'

Eaton, Theophilus, American colonial governor: b. Stony Stratford, Buckinghamshire, England, about 1591; d. New Haven, Conn., 1658. He came over to Massachusetts with the Rev. John Davenport, 1737, founding with Davenport the town and colony of New Haven, in 1638. He was chosen governor October 1639, and re-elected annually as long as he lived. He was prominent in the organization of the New

England Confederation 1634, and the so-called Connecticut "Blue Laws" were drawn up by him, assisted by Davenport, 1655.

Eaton, Thomas Treadwell, American Baptist clergyman, and author: b. Murfreesboro, Tenn., 16 Nov. 1845. He was graduated at the Washington and Lee University 1867; was ordained (1870) to the Baptist ministry, holding pastorates successively at Lebanon, Chattanooga, Tenn.; Petersburg, Va., and Louisville, Ky. Since 1887 he has been the editor of the 'Western Recorder.' Among his works are: 'The Angels' (1873); 'Talks to Children'; 'Talks on Getting Married'; 'The Bible on Women's Public Speaking'; 'Wives and Husbands'; 'The Theatre'; 'How to Behave as a Church Member'; 'Conscience in Missions'; and 'Faith of Baptists.'

Eaton, Timothy, Canadian merchant: b. Clogher, near Belfast, Ireland, October, 1835. While still a young boy he was apprenticed to a draper at Portglenone, but having served his five-year term and received his wages of about £100, in 1857 he emigrated to Canada. He first opened a store at Kirkton, in Huron County; later went to Saint Mary's; and finally settled in Toronto, where, in 1869, he opened the store which has since expanded into one of the largest department stores in America. In 1905 he established a branch at Winnipeg.

Eaton, William, American officer: b. Woodstock, Conn., 23 Feb. 1764; d. Brimfield, Mass., 1 June 1811. He served in the army 1780-3, and then went to Dartmouth College, where he was graduated 1790. Becoming captain in the United States army in 1792, he served in campaigns against the Indians till 1798, when he was sent to Tunis as American consul. During the war against Tripoli in 1801 he resolved to re-establish Hamet Caramelli as Bey of Tripoli, but was not supported in his attempt by the American naval officers. He returned to America in 1803, and was subsequently appointed naval agent of the United States for the Barbary powers. Returning to Africa he captured the city of Derne 27 April 1805, but the United States concluding a treaty of peace with the usurper Yussuf, Eaton returned to America.

Eaton, William Wallace, American politician: b. Tolland, Conn., 11 Oct. 1816; d. Hartford, Conn., 19 Sept. 1898. He received a common school education; became a lawyer; and settled in Hartford in 1850. During the Civil War he was called a "Peace Democrat," and urged resistance to any Massachusetts troops passing through Connecticut. He was a member of the United States Senate in 1875-81; and of the House of Representatives 1883-5.

Eaton, Ohio, village, county-seat of Preble County, on the Pittsburg, C., C. & St. L. R.R. It is a trade centre for an agricultural section. Pop. 3,246.

Eatonton, ɛ'tôn-tôn, Ga., city, county-seat of Putnam County; on the Central of Ga. R.R.; about 68 miles southeast of Atlanta. It is the trade centre for a section in which are raised fruit, and cotton. Its manufactures are dairy products, and cotton goods. Pop. 2,000.

Eau, ô, a French word signifying water, and used in English with some other word for several spirituous waters, and particularly perfumes: (1) *Eau de Cologne*, a fragrant water

made originally and in most perfection in Cologne. It was invented by Farina. (2) *Eau Cr  le*, a highly esteemed cordial made in Martinique, West Indies, by distilling the flowers of the mammee apple with spirit of wine. (3) *Eau de Javelle*, a preparation of chloride of soda, used as an antiseptic, and a bleaching agent. (4) *Eau de Luce*, invented by a person named Luce, at Lille, in Flanders, is a volatile preparation, made from oil of amber, alcohol, and ammonia. It is a milky fluid, powerfully antispasmodic, and stimulant. Mixed with nitric acid it forms a substitute for musk. (5) *Eau de Paris*, a substitute for cologne, and which is sometimes taken in sweetened water as a cordial, and stimulant. (6) *Eau de Vie*, a brandy; specifically the less perfectly purified varieties, the best being called cognac. (7) *Eau de vie de Dantzig*, a white liqueur, or cordial, sweet and strong, in which are introduced for ornament small particles of gold-leaf. (8) *Eau de vie d' Hendaye*, a sweet French cordial, of which there are three varieties—white, green, and yellow.

Eau Claire,   kl  r, Wis., city, county-seat of Eau Claire County, at the mouth of the Eau Claire River, and the head of navigation of the Chippewa River, and on the Chicago & N.; Wisconsin C., and several other railroads; 85 miles east of St. Paul, and 150 miles northwest of Madison. It is the commercial centre for northwestern Wisconsin, and the outlet of the Chippewa lumber district, with extensive water power. It has a great trade in lumber, and manufactures over 300,000,000 feet annually. There are extensive manufactures of iron and linen goods, furniture, machinery, and shoes. The city is noted as a summer resort, and has electric railroads, and street lights, waterworks, public library, and high school, Sacred Heart Hospital, national and savings banks, daily and weekly newspapers. Pop. (1900) 17,600.

Eaux-Bonnes,  -b  n, France, a celebrated watering-place, department Basses-Pyr  n  es, at the bottom of a narrow gorge, about 25 miles south of Pau. The springs, which have a temperature of about 90  , are strongly impregnated with sulphur. About 6,000 to 10,000 visitors resort hither in the course of the season, which lasts from June to October. Pop. (1891), 735.

Eaux-Chaudes,  -sh  d, France, a watering-place in France, three miles southeast of Eaux-Bonnes. Some of its springs have the same properties as those of the Eaux-Bonnes, and others are more strongly impregnated with sulphur.

Eaves or Cliff Swallow, one of the familiar North American swallows (*Petrochelidon lunifrons*) common about buildings where, as explained under BARN-SWALLOW, it has taken up its residence as fast as the country became settled. It is to be recognized by the squareness of the tail (not deeply forked as in its larger associate, the barn-swallow), the chestnut rump, whitish belly and blue spot on the breast. It is most peculiar, however, in its nests, which are always attached to the outside of the building, and usually in close row under the protection of the eaves. These nests are made of pellets of mud; are shaped like bulbous flasks with a curved neck forming an entrance; and are attached by their base to the

wall. In the primitive wilderness these nests are attached in crowded colonies to the faces of cliffs, where whole masses would frequently scale off by reason of the weight or of the loosening action of rain. Much safer and better conditions are found under the protection of the eaves of buildings; and not only has this swallow everywhere taken advantage of this fact, but striking modifications in their architecture have followed. The eggs closely resemble those of the barn-swallow, and two broods are usually raised. The species abounds in suitable localities all over the continent, migrating to the tropics in winter.

Eaves'drip, an ancient custom, or law, corresponding to the well-known urban servitude of the Romans called stillicide, where a proprietor was not allowed to build to the extremity of his estate, but must leave a space regulated by the charter by which the property was held, so as not to throw the eavesdrop on the land of his neighbor.

Ebal,  'bal, a mountain in Palestine, nearly 3,000 feet in height; 35 miles north of Jerusalem, situated north of Mount Gerizim, from which it is separated by a narrow valley containing the town of Nablus, anciently Shechem. Here the Israelites were commanded, on their entrance into the Holy Land, to set up an altar to Jehovah of hewn stones. The fulfilment of this is recorded in Joshua (viii. 30-35). From Mount Ebal the curse for disobedience to the law was pronounced, the blessing for obedience being given from Mount Gerizim, which lies across the valley. The modern Arabic name of Ebal is Jebel Eslamiyah.

Ebel'ians, German sect, named after Ebel, a Prussian archdeacon, one of the founders. It arose in K  nigsberg, Prussia, about 1836, the Archdeacon Ebel and Dr. Diestel being its leaders. They believed in spiritual marriage. In 1839 sentence was passed against their leaders, who were charged with unsound doctrine and impure lives, but it was removed in 1842. Their enemies called the sect Mucker, that is, in German, hypocrites.

Ebeling,  'bel-ing, **Christoph Daniel**, German scholar: b. Garmissen, near Hildesheim, Hanover, 20 Nov. 1741; d. Hamburg 30 June 1817. He was noted for his extensive knowledge of Oriental languages, of classic and foreign literature, and of history and geography. He published a history and geography of North America (1796-1816), for which he received a vote of thanks from the United States Congress. He paid special attention to the geography of the New World, and collected about 10,000 maps and nearly 4,000 books, all relating to America. This library was purchased in 1818 by Israel Thordike of Boston, and presented by him to Harvard College.

Ebenezer,  b- -n  z  r (Heb. "the stone of help"), commonly used as any memorial of divine assistance, originally the name of a field where, at Samuel's request, the Lord discomfited the Philistines with thunder, etc. On this occasion Samuel set up a stone, and gave it this designation, to indicate that the Lord had helped them. The site has never been definitely ascertained.

Ebensburg, Pa., borough, county-seat of Cambria County; on a branch of the Pennsylv-

vania R.R., about 79 miles east of Pittsburg. The manufactories are woolen-mills, tanneries, saw-mills, and iron-works. It is about 2,300 feet above sea-level. Pop. 1,621.

Eberhard, ä'bër-härt, Christian August Gottlob, German poet and descriptive writer: b. Belzig 12 Jan. 1769; d. Dresden 13 May 1845. His verse is a reminiscence of the 18th century style and of the school of Gleim, the idyl 'Little Hans and the Cookie' (1822); and 'Various Poems' (1833), eminently so. His best prose is in 'Italy as It Impressed Me' (1839).

Eberhard, Johann August, yō-hän ow'-goost, German philosophical writer: b. Halberstadt 31 Aug. 1739; d. there 6 Jan. 1809. He first attracted attention with a 'New Apology of Socrates' (1772), an attack upon the narrow theology of the day, to which succeeded 'Universal History of Philosophy' (1788); 'Handbook to Æsthetic' (1803-5); and other works from a Wolfian standpoint, in harmony with Leibnitz and in opposition to Kant.

Eberle, ä'bër-le, Robert, German artist: b. Meersburg 22 July 1815; d. Eberfing, near Munich, 19 Sept. 1860. He was a pupil of Biderman and later of Van de Velde. His talent was particularly displayed in painting sheep. One of his works, 'A Shepherdess,' is in the Modern Gallery, Munich.

Eberlein, Gustav, German sculptor: b. Spierkershausen, Hanover, 1847. His chief work is a long frieze ornamenting the façade of the Ministry of Cults, Berlin, with 50 figures attending religion. He did other decorative work for the University of Kiel. Among his works are: 'Drawing out a Thorn'; 'Greek Flute Player'; 'Psyche,' and the 'Archer.' From his hand also are five allegorical groups at Stuttgart, and monuments of William I. at Elberfeld, Geisslingen, Mannheim, Altona, and Ruhrort, and one of Frederick I. in Berlin. He is the author of 'Aus Eines Bildners Seelenleben, Plastik, Materie und Poesie' (1892).

Ebers, Emil, ä'mël ä bërs, German artist: b. Breslau 14 Dec. 1807; d. Beuthen 1884. He studied at the Academy of Düsseldorf and early turned his attention to dramatic subjects such as scenes of battle in the Middle Ages, brigandage, sailors, fishermen, etc. In later years, after traveling much and visiting the shores of the North Sea, Holland, and Normandy, he devoted himself to marine painting exclusively. Among his works are: 'Smugglers About to Land' (1830), in the National Gallery, Berlin; 'Fisherman's Hut' (1831); 'Smugglers Surprised' (1832); 'Smugglers in Tavern' (1835); 'Repressing Revolt'; 'Dutch Smugglers on Coast of Normandy' (1842); 'Prussian Hussars maltreating French Peasants' (1843); 'Life Boat' (1844); 'Pilot Boat' (1845); 'Storm on Inland Sea' (1845); 'Mutiny on Brig' (1848); and some historical paintings, such as 'St. Goar converting the Rhine Provinces.'

Ebers, Georg Moritz, gā-ōrg mō'rīts, German Egyptologist and novelist: b. Berlin 1 March 1837; d. Tutzing, Bavaria, 7 Aug. 1898. About 1859 he began to devote himself almost exclusively to Egyptological studies, and in 1868 was appointed extraordinary professor of the language, history, and antiquities of ancient Egypt at Jena. In the following year he traveled in Egypt, Nubia, and Arabia, and on his

return in 1870 became ordinary professor of Egyptology at Leipzig. Another visit to Egypt in 1872-3 resulted in the discovery of the important medical papyrus, now known by his name. Among his published contributions to Egyptology are: 'Disquisitiones de Dynastia vicesima sexta Regum Ægyptiorum' (1865); 'Ägypten und die Bücher Moses' (Vol. I, 1868, not completed); 'Durch Gosen zum Sinai' (1872); 'Papyrus Ebers' (1875); 'Eine Galerie antiker Portraits' (1889); 'Die hieroglyphischen Schriftzeichen der Ägypter' (1890); and 'Ägypten in Bild und Wort' (1878-9), translated into English as 'Egypt, Descriptive, Historical, and Picturesque' (1880). Besides these works he published many novels, mostly dealing with Egyptological subjects, among which are: 'Eine Ägyptische Königstochter' ('An Egyptian Princess' 1864); 'Uarda' (1877); 'Homo Sum' (1878); 'Die Schwestern' ('The Sisters' 1880); 'Der Kaiser' (1881); 'Serapis' (1885); 'Josua' (1889); 'Per Aspera' (1892); 'Kleopatras' (1894); and 'Arachne' (1897). He also published a poem called 'Elison' (1888), and an autobiography (1892), entitled 'Die Geschichte meines Lebens.' A collective edition of his works was published at Stuttgart (1893-7).

Eberswalde, ä-bërz-väl-de (ancient NEUSTADT-EBERSWALDE), Germany, town on the Finow Canal, about 28 miles northeast of Berlin. It is a busy industrial centre, having a number of machine-shops, saw-mills, paper-mills, and iron-works, and doing a considerable trade in lumber and coal. There is here a royal academy of forestry. Eberswalde is a favorite summer resort for the people of Berlin. Pop. 18,500.

Ebert, ä'bërt, Karl Egon, Austrian poet and dramatist: b. Prague 5 June 1801; d. there 24 Oct. 1882. He began with dramas of Bohemian history, many of which were staged but only one printed, 'Wratislav and Jutta' (1835). As a lyric poet and balladist he was more successful; his 'Poems' (1824) contain fine lyrics, and 'Schwerving the Saxon Duke' is still high in popular favor. His longer poems — 'Vlasta: a National Hero-Poem of Bohemia,' and 'The Monastery,' are fluent in style as well as pure and elegant in language. 'A Monument to Karl Egon, Prince of Fürstenberg,' consists of a garland of sonnets; 'Devout Meditations of a Man of the World' is a didactic poem.

Ebionites, ē'bī-ōn-its, a sect composed of Jewish believers in Jesus of Nazareth as being the Christ or Messiah, who nevertheless retained many of the practices and beliefs of their ancestral religion. Their name, Ebionites, seems to be formed from the Hebrew word *ebionim*, poor folk; but some of the ancient writers, unacquainted with the history of the primitive church of Jerusalem and Judea and with the Hebrew language, derive the name from that of a supposititious heresiarch Ebion. If the name was originally *ebionim*, "the poor," the sect will have chosen for itself in effect the same name as the mediæval sect of the Poor Men of Lyons. The Ebionites are by many authors confounded with the Nazarenes or Nazarites, another body of Christians Jewish by race and in a measure also Jewish in religion. The rise of the Ebionite sect is commonly referred to the time of Trajan, when, the whole Jewish race being excluded

from Ælia Capitolina (as Jerusalem was named anew), these people, despised alike by Jews, Christians, and pagan Romans, migrated to Peræa, the country beyond the Jordan, and there freely developed their religious tenets and practices. They were Jewish rigorists, zealots, with some tinge of Christian belief, in that they held Jesus to have been the Messiah; but they held him to be only man and begotten like other men. The Mosaic law they believed to be of everlasting obligation upon all believers in Jesus Christ whether of Jewish or Gentile race. St. Paul they regarded as a traitor and arch-apostate for his having declared Mosaism superseded by the law of Christ. Of the Christian sacred books they held the Hebrew gospel of St. Matthew to be the only one given through Divine inspiration.

Eb'lis, or **Father of Devils**, in Arabian mythology, the ruler of the evil genii or fallen angels. Before his fall he was called Azazel or Hharis. When Adam was created, God commanded all the angels to worship him; but Eb'lis replied: "Me thou hast created of smokeless fire, and shall I reverence a creature made of dust?" God was very angry at this insolent answer, and turned the disobedient angel into a Sheytân (devil), and he became the father of devils. He is described as of enormous size, with a red-striped skin, a ring-pierced nose, long hair, large flapping ears and a very long tail. See **DEVIL**.

Ebner-Eschenbach, äb'nër ësh'ën-bän, **Baroness Marie von**, Austrian author: b. (COUNTESS DUBSKY) Castle Zdislavice, Moravia, 13 Sept. 1830. Beginning in 1860 as a playwright, her 'Mary Stuart in Scotland' (1860), and the tragedy 'Marie Roland,' with the one-act dramas 'Doctor Ritter,' 'Violets,' and 'The Disconsolate One,' were but moderately successful. Turning to fiction, 'The Princess of Banalia' (1872), a satiric tale, made little impression; but 'Two Countesses' (1885), a story of Austrian high society, met with striking favor. Her other writings include: 'Tales of Village and Castle'; 'The Child of the Parish' (1887); 'The Rival'; 'Aphorisms' (1880); and 'Parables, Stories and Poems' (1892).

Eb'onite, or **Vulcanite**, a name given by Goodyear for what is generally known as hard rubber. It is a vulcanite with a larger proportion of sulphur and certain added ingredients. The proportion of sulphur is from 30 to 60 per cent, and to this may be added certain amounts of shellac, gutta-percha, sulphates of zinc, antimony, or copper. It is used of many colors, as may be gathered from the above list of ingredients, and of hardness and consequent facility for taking polish. The compound, despite its name, may resemble horn, ivory, bone, wood, etc. See **VULCANITE**.

Ebony, various kinds of wood obtained from several species of *Diospyros*, a genus of trees of the natural order *Ebenaceæ*. The most valued and most frequently used varieties are very close-grained, hard and dark-colored, the best qualities black. This grade is obtained from *D. ebenus*, a native of the eastern tropics, especially India. It is a large tree from which logs containing a cylinder of the dark heart wood more than 18 inches in diameter are often obtained. The sap wood is less valued, being of

lighter color and less hard. The wood is especially valued for inlaying, cabinet work, musical instruments, etc. Various other names are given to certain varieties of ebony obtained from other regions, as calamander wood, cadoobergia wood, etc. Occasionally specimens of *D. virginiana*, popularly known throughout the southern United States as the common persimmon, furnish a fair grade of ebony. Several other trees, especially of the genus *Maba*, yield varieties of ebony, as do also a few trees of the order *Leguminosæ*. Bastard ebony is obtained from species of Jacaranda, Brazilian trees. Imitations of ebony are sometimes made by dyeing hard, close-grained woods so as to resemble the genuine ebony.

Eboracum, ē-bōr'a-kūm, the Latin name of York. Hence New York is styled in Latin works "Novum Eboracum."

Ebro, ā'brō (Lat. *Iberus*), a river in Spain, once the boundary between the territory of Rome and Carthage, has its source in the province of Santander, 10 miles west by north of Reynosa. Pursuing a southeast course of about 500 miles, it flows into the Mediterranean by two mouths. It is navigable for boats up to Tudela, about 180 miles from its mouth, but is obstructed by shoals and rapids, to avoid which a canal, about 100 miles long, has been constructed south of and nearly parallel to the river.

Ebs'worth, Joseph, English dramatist and musician: b. London 10 Oct. 1788; d. Edinburgh, 22 June 1868. He wrote, adapted, or translated many successful plays; among them 'The Rival Valets' (1825), a comedy drama, and 'The Crusaders' (1850-1), a drama. He was an adapter rather than a creator. His songs, learning, and versatility made him a distinguished figure in Edinburgh circles. He wrote also in collaboration with his wife, Mary Emma (Fairbrother).

Ebullition, ēb-īl-līsh'ōn, the bubbling up or agitation which results from the action of heat on a liquid. The escape of vapor from water depends not merely upon the temperature, but upon the presence of gases and other bodies, upon the vessel, and a variety of circumstances, so that a strict definition is necessary. The usual statement is that ebullition is the conversion of a liquid into a vapor or gas having the same tension or elastic force as the air. This conversion takes place at different temperatures for different substances, but it is so constant for each substance that the fixity of the boiling-point of a fluid is regarded as a very good test of its purity. In determining what that point is, it is of course necessary to ascertain what the atmospheric pressure is, to see that it does not vary during the experiment, and to fix upon some standard pressure for comparison of results. The pressure is estimated by the barometer. It is possible to heat water 20° F. above its boiling point without ebullition. See **HEAT**.

Eça de Queiroz, José Maria, hō-sā' mārē'ā ā'sā-dā-kārōs, Portuguese novelist: b. Póvoa do Varzim 25 Nov. 1845; d. Neuilly, France, September 1900. At first a journalist, he traveled and was in the consular service in many parts of the world. He introduced the naturalistic school into Portugal. His powers of observation and description are extensive, and in his novels — 'The Crime of Father Amaro'

ÉCARTÉ — ECCLESIASTES

(1874, rewritten in 1880); 'The First Monk of St. Basil' (1877); 'A Relic' (1886) — he portrays in master strokes the failings of Portuguese society. His strange, half realistic, half fanciful story, 'The Relic,' weaves into a narrative of Oriental travel a dramatic representation of the Passion of Christ in the form of a dream. In collaboration with Ramalho-Ortigão he wrote the spirited tale of adventure, 'The Mystery of Cintra Street.'

Écarté, ā-kār-tā, from the French, meaning discard, a game at cards for two persons. The game is played with a piquet pack, that is 32 cards, the small cards, from 2 to 6, being excluded. For convenience of dealing, two packs are generally used. The players cut for the deal; the lowest card (in France the highest) deals. The dealer gives 5 cards to each player, 3 and 2 at a time, and turns up the 11th card as trump (French, *atout*). If the turn-up is a king he scores 1, and if a king turns up in the hand of either player the holder may score 1, but in each case this must be announced before the first trick by saying, "I mark king." The king is the highest card, the queen next, then knave, ace, 10, etc. Trump takes all other suits. In playing the non-dealer leads; the other player must follow suit, and take the trick if he can; if he cannot follow suit, he must play trump, if he holds one. The winner of the trick leads again till the 5 tricks are exhausted. Three tricks count 1 point, 5 tricks 2 points. Five points make a game. The player, according to the French game, must announce the suit he plays, and if he plays differently, can be compelled to play as he announces, or if he cannot, as his adversary pleases.

Ecbatana, ěk-bāt'a-na, the chief city or ancient metropolis of Media, built, according to Pliny, by Seleucus. It was the summer residence of the Persian and Median kings, and existed in great splendor at a very early period in the history of the world. There are no traces now remaining of the site of this celebrated city.

Eccard, Johannes, German composer: b. Mühlhausen, Thuringia, 1553; d. Berlin 1611. He became Kapellmeister to the Margrave of Brandenburg at Königsberg in 1589, and in 1608 became Kapellmeister in Berlin. He is noted as a composer of hymns and other church music.

Ecce Homo, ěk'sē hō'mō ("Behold the Man"), the rendering, in the Latin Vulgate, of the words with which Pilate presented Christ, in scarlet robe and crowned with thorns, to the populace. The figure of Christ in this scene is the subject of a celebrated painting by Correggio which is preserved in the National Gallery of Painting in London. Other great painters have chosen the same subject, among them Guido Reni, whose 'Ecce Homo' is in the Picture Gallery of Dresden.

Eccentric, or **Eccentric Circle**, in ancient astronomy, a circle whose centre was supposed to be displaced from the centre of motion. It was a makeshift to try to account for the motions of the planets before Kepler's discovery of their true motion in ellipses with the centre of attraction at one of the foci of the ellipse. Also, in mechanics, a term applied to contrivances for converting circular into reciprocating rectilinear motion, consisting of variously shaped disks attached to a revolving shaft.

Eccentricity, deviation from a centre; the state of a circle with respect to the non-coincidence of its centre with that of another circle: also applied to persons.

Ecchymosis, ěk-ī-mō'sīs, a subcutaneous hemorrhage due either to bruising or some form of external injury, or occasionally the result of a peculiar blood disease hæmophilia. Ecchymoses usually result in varying grades of discoloration, and are best treated by means of hot water, locally applied.

Ecclefechan, ěk-l-fěh'ān, Scotland, village of Dumfriesshire, nearly a mile from a station on the main line of the Caledonian R.R., 20 miles northwest of Carlisle. Its interest is that it is the birth- and burial-place of Thomas Carlyle, and is unmistakably the "Entepfuhl" of his famous spiritual autobiography, 'Sartor Resartus.' The house in which he was born, 4 Dec. 1795, still stands, and in the west corner of the churchyard around the United Presbyterian Church, which represents the old Secession Church, he was laid, as he wished to be, beside his father and mother. Pop. 750.

Eccles, Robert Gibson, American chemist: b. Scotland 1 Jan. 1848. He came to the United States in 1862 and became chemist in the Bureau of Indian Affairs; and professor and dean in the Brooklyn College of Pharmacy. He has discovered calycanthic acid and the alkaloids calycanthine, glaucusine, etc., and devised the official method of assaying pepsin and investigated the effects of drugs on peptic digestion. He also exposed numerous fraudulent medicines, among them the Scotch oats essence. He has written more than 100 articles on philosophic and scientific subjects.

Eccles, England, a municipal borough in Lancashire, four miles from Manchester, of which it is a suburb. There are here numerous cotton-mills. Pop. 34,369.

Ec'clesfield, England, a township in the West Riding of Yorkshire, six miles north of Sheffield. The chief manufacture is cutlery, then flax, linen, paper, and nails; while in the vicinity there are coal and iron mines. Pop. 26,000.

Eccle'sia ("convocation"), a popular assembly, especially that of Athens, where the people exercised full sovereignty, and at which every citizen of 20 years of age was entitled to vote. The people voted either by show of hands or occasionally by ballot, the latter method being by white and black pebbles. Beside the legislative powers of the assembly, it could make inquisition into the conduct of magistrates, and in turbulent and excited times exercised a power resembling that of impeachment, as in the cases of Demosthenes and Phocion. The assembly was sometimes suddenly broken up at the occurrence of an unfavorable omen, as thunder and lightning, sudden rain, or any unusual natural phenomenon. The Athenian ecclesia held originally 4, ultimately 40, ordinary meetings in the year. The term was also applied by the Septuagint translators to the Jewish commonwealth, and so was naturally adopted by New Testament writers to designate the Church.

Eccle'sias'tes, or **The Preacher** (Heb. *Kohleth*, "assembler"), one of the didactic books of the Old Testament canon, professing to be the words of the preacher, the son of David,

king in Jerusalem. It contains allusions to the writer's riches, palaces, and parables, and its sententious style reminds one of the author of the Proverbs. Yet its diction is marked by Chaldaisms and linguistic usages which are thought not to have been introduced into the Hebrew language till about the period of the Babylonian captivity. The authorship of the Ecclesiastes has been attributed to Solomon, whose claims have often been challenged and always defended; and if it be not his, it must remain entirely uncertain, for no writer of the Babylonian period is known so nearly resembling him in wisdom and wealth of thought. The book consists of philosophical reflections upon human life, and while it affirms: "Vanity of vanities, all is vanity," it also comes to the conclusion of the whole matter in the words: "Fear God and keep his commandments, for this is the whole duty of man." Some entertain the opinion that its original form must have been a dialogue in which the sage carries on a discussion with a skeptic and a libertine. Yet it is more commonly regarded as the monologue of a Hebrew moralizing on life and searching for the highest good, scanning the perversities and follies of man, and at length, after a review of the evidence, declaring the verdict that obedience to God is the only real and substantial good.

Ecclesiastical Commissioners, for England, are a body corporate with a common seal, perpetual succession, and power to hold real estate, constituted by acts 6 and 7. Will. IV. chap. lxxvii., 3 and 4 Vict. chap. cxiii., and 13 and 14 Vict. chap. xciv. It consists of all the bishops of the Church of England, the deans of Canterbury, St. Paul's, and Westminster; the chief justices, 5 cabinet ministers, and other legal dignitaries, and 12 lay members appointed by the crown and the archbishop of Canterbury. This body has extensive powers in regard to the organization of churches, the distribution of episcopal duties, revenues, etc. The schemes adopted by the commission, on being laid before the king in council, approved of, and gazetted, acquire the force of acts of Parliament.

Ecclesiastical Titles Act, a law of the British Parliament, enacted in 1850 (14 and 15 Vict. chap. 60) to prohibit, under penalty, the assumption of ecclesiastical titles (for example: Archbishop of Westminster, Bishop of Clifton, Dean of Sheffield) by any persons not duly appointed to such stations according to the laws of the realm touching the Church establishment. There was already in the statute book a law of 10 Geo. IV., chap. 7, which provided that any person who should assume or use the name, style or title of archbishop of any existing ecclesiastical province, or bishop of any existing diocese, or dean of any existing deanery of the Established Church of Great Britain, and Ireland, the same not having due legal right to such name, etc., should for each violation of the act forfeit £100. But in the year 1850 Pope Pius IX., by apostolic brief, instituted an ecclesiastical province or archbishopric comprising all England and Wales, with Nicholas Wiseman (afterward cardinal) as archbishop, with the style and title of Archbishop of Westminster, and with 12 suffragan bishops presiding over dioceses named: Beverley, Birmingham, Clifton, Hexham, Liverpool, Newport and Menevia, Northampton, Nottingham, Plymouth, Salford, Shrewsbury and Southwark; none of

these towns was then the see of any bishop of the Established Church; and therefore the prohibition of the statute of George IV. did not apply. But the announcement of the setting up of these Roman Catholic dioceses provoked a fierce anti-papery agitation, and the prime minister, Lord John Russell, introduced in the Parliament a bill, which was speedily passed, extending the penalty of the act of George IV. to persons who should assume the titles archbishop, bishop or dean "in respect of any places within the United Kingdom." The new dignitaries ignored the act, assumed their titles, braved prosecution, and not one of them was ever called into court for contumacy. After the act had stood on the statute book as the law of the realm during 20 years it was amended by the act of 34 and 35 Vict., chap. 53. The penalty was dropped, but the so-called repealing act recited again the legal grounds for the penal enactment and declares that "no ecclesiastical title of honor or dignity derived from any see, province, diocese, or deanery recognized by law, or from any city, town, place or territory, within the realm can be validly created"; and that "no pre-eminence or coercive power can be conferred otherwise than under the authority of Her Majesty"; decisions of law that had never been impugned in England since the time of Henry VIII.

Ecclesiology, the science of the Church as an organized society, a branch of knowledge which deals with ecclesiastical antiquities, such as buildings, rites, vestments, etc.

Ec'cleston, Samuel, American Roman Catholic prelate: b. Kent County, Md., 27 June 1801; d. Georgetown, D. C., 21 April 1851. He was educated in St. Mary's College, Baltimore, and ordained to the priesthood of the Roman Catholic Church 1825. He subsequently served St. Mary's College as vice-president and president; became archbishop of Baltimore in 1834; and established the College of St. Charles in 1850. He was president of five provincial councils and inaugurated the movement which resulted in the laws for the transmission of church property from a bishop to his successor and for the excommunication of any Roman Catholic who, after being divorced by the State, should marry again.

Ecdysis, the process of casting the skin (see MOLTING). The term is used mainly in reference to the exuviation of the pupa of insects, and of the outer cuticle of lower invertebrates, as crabs.

Ech'ard, or Eachard, Laurence, English clergyman and historian: b. Barsham, Suffolk, 1670 (?); d. Lincoln 16 Aug. 1730. His 'History of England from the First Entrance of Julius Cæsar and the Romans to the End of the Reign of James the First' (1707) contains a wealth of information, including the particulars of Cromwell's interview with the Devil on the morning of the battle of Worcester. Other historical and scholarly works increased his reputation.

Echegaray, José, hō-sā' ā-chā'gā-rā'ē, Spanish dramatist: b. Madrid 1832. He is author of several treatises on mechanics and civil engineering, and was for a time minister of commerce and of public instruction. Since 1874, when the production of 'The Avenger's Bride' opened a new and brilliant life for the Spanish

stage, he has given himself wholly to the drama; producing in a few years 30 plays rich in imagination, dramatic force, and lyric talent. In 1905 he was presented with the Noble Prize for literature by the Swedish Academy. Of his greatest pieces may be named: 'The Great Galeotto'; 'Madman or Saint'; 'Conflict Between Two Duties'; 'A Merry Life and a Sad Death.' See Zacher, 'Don José Echegaray' (1892).

Echellen'sis, Abraham, Maronite scholar: b. Ekhel in the Maronite country of Mount Lebanon; d. 1664. He was an alumnus of the College of the Maronite nation at Rome, and was called to the chair of Syriac and Arabic in the College of the Propaganda. From 1630 till 1642 he was engaged at Paris in making Arabic versions of books of Scripture for a Polyglot Bible; afterward, from 1652 till his death, he was employed in similar work under the auspices of the Congregation de Propaganda Fide at Rome. He made Latin translations of numerous works in Arabic.

Echelon, ěšh'ělŏn (Fr. "a ladder or stepping stone"), used in military language. A battalion, or regiment, marches *en échelon*, or *par échelon*, if the divisions of which it is composed do not march in one line, but on parallel lines. The divisions are not exactly behind each other, but each is to the right or left of the one preceding, so as to give the whole the appearance of a stairway. This order is used if the commander wishes to bring one part of a mass sooner into action and to reserve the other. If the divisions of the *échelon* are battalions, these are generally from 100 to 200 steps from each other. An *échelon* is said to be direct if its head maintains a position perpendicular to the original line, as in direct attack or retreat; it is said to be oblique when it deviates from the line, as in changing the order of formation.

Echeneis, ěk-ě-ně's, a genus or family of fishes. See REMORA.

Echenique, José Rufino, hŏ-sā' roo-fě'nŏ ā-chā-ně'kā, Spanish-American soldier and statesman: b. Puno, Peru, 1808; d. Arequipa 18 Oct. 1879. He joined the Patriotic party as a boy, rose to the rank of colonel and induced the revolted troops of Gamarra and Bermudez to return to their allegiance in 1833; at the battle of Yungay 1839, he fought on the side of Vera Cruz, in 1845 was a member of Castillas council of state, and in 1851 was elected president of Peru. In 1854 he was charged with financial irregularities and Domingo Flias led a revolt against him which terminated in the battle of Saraija 1854. He was defeated in a second revolt, at the bridge of Isuchacha, 2 Aug. 1854, retired to Lima, was again defeated at the battle of La Palma, 5 Jan. 1855, and driven into exile. He was permitted to return as a private citizen and was even a presidential candidate in 1872, but spent the last years of his life in retirement.

Echeverria, ā-chā-vā-rě'ā, Estaben, Argentine poet: b. Buenos Ayres, Argentina, 1809; d. Montevideo, Uruguay, 1851. He was educated in France and was banished from Argentina by Rosas. Among his works, which are in great repute among his countrymen are: 'Consuelos' (1834); 'Rimas'; 'Cautiva' (1837), containing delightful descriptions of the pampas; 'Guitarra' (1842); and 'La Insurreccion del Sud' (1849).

Echid'na, or **Spiny Ant-eater**, an Australian monotreme animal of the family *Echidnidae*, or *Tachyglossidae*, closely related to the duckbill, but very different in outward appearance. Echidnas are spiny, porcupine-like creatures, 12 to 18 inches long, with broad bodies, stout legs terminating in large, strong claws well suited for digging, and a small head, ending in a slender snout. The mouth is toothless but the palate bears a number of recurved spines, which answer the purpose of teeth; the tongue is extensile and glutinous. The animal resembles the hedgehog in that it curls up when in danger, presenting its long spines, and protecting by this method its naked belly. It lives in burrows and feeds chiefly on the juicy larvæ of ants, into whose hill its digs with its great claws. Like the duckbill, the echidna lays eggs, but little is known as to their hatching. The creatures are docile and are easily tamed, becoming playful in captivity and exhibiting considerable intelligence. They are nocturnal in habits, and spend periods of drought curled up in their burrows. The common echidna (*E. aculeata*) is found in Tasmania and New Guinea. It is so variable in color and size that it is sometimes held to form two species, differentiated by their general size and habitat. The "nodiak" of Papua (*Proechinida* or *Acanthoglossus bruijnii*) is a kindred animal hunted by the natives for food.

Echinades, ě kĭn'a-děz (modern KURZOLARI), a group of islands at the entrance of the Gulf of Corinth, and now in part united to the mainland by deposits brought down by the Achelous River. It was near these islands that the Battle of Lepanto was fought in 1571. See LEPANTO, BATTLE OF.

Echinocactus, ě-kĭ-nŏ-kak'tŭs, a genus of plants of the natural order *Cactaceæ*, characterized by globular or shortly cylindrical forms with prominent ribs and strong spines. Over 200 species, mostly Mexican, have been described; about 40 species are natives of the southwestern portion of the United States, extending as far north as southern Utah, Colorado, and Nevada. The flowers, which are highly colored, mainly in shades of yellow and red, are borne just above the areas producing the youngest spines and are succeeded by dry or succulent fruits of no economic use. The plants are raised with comparative ease from seeds, given abundant light, but not direct sunlight, which tends to dry the little seedlings, supplied moderately with water before the soil has a chance to bake, and kept in a temperature of about 60 degrees. When about two inches in diameter they may occupy single pots as specimens. About 50 species are cultivated in American greenhouses, and are among the favorite plants of their order.

Echinococcus, ě-kĭ-nŏ-kŏk'us, a small tapeworm (*Tania echinococcus*), to which is due the disease called "hydatids" in man and in various animals. See TAPEWORM.

Echinocĕ'reus, a genus of plants of the natural order *Cactaceæ*, with generally low, thickly clustered stems, mostly short funnel-formed, brilliantly colored flowers of various tints, and globose or ellipsoidal fruits which are spiny until they reach maturity. By some botanists the genus is united with *Cereus*, from which it is distinguished mainly by technical characters that are present in some species of

ECHINODERMATA — ECHINOIDEA

each group. About 25 pieces are general favorites in American greenhouses. They are cultivated in about the same way as *Echinocactus* and *Cereus* (q.v.).

Echinodermata, ĕ-kī-nō-dēr-ma'-ta, or **Echinoderma**, one of the most distinct phyla of the animal kingdom, embracing the crinoids, sea cucumbers, sea urchins, and starfishes. On account of a predominating radial symmetry Cuvier united them with the *Calenterata* in his type *Radiata*. Leuckart was the first to clearly perceive that only a superficial resemblance exists between the members of these two great groups and to him is due the elevation of the *Echinodermata* to the importance of a distinct phylum. The skin is always more or less indurated by the deposition of calcium carbonate in the form of variously shaped spicules, spines, disks or plates, either isolated or united to form a reticulum or a continuous test. There is a principal axis around which most of the organs of the body are repeated five times in a radial manner. While this pentamerism is generally predominant, certain organs (madreporic plate, stone canal, "heart") occur in but one radial axis which, therefore, lies in a median plane to which all other organs are bilaterally related. Of the repeated organs the digestive glands, radial canals, nerves, various vessels, the eye-spots, and some others, are radial, the genital organs (single in *Holothuroidea*) and polian vesicles interrational in position. The partial suppression of one ray or two rays, and among the starfishes a multiplication of rays, may take place; furthermore, in some *Echinoidea* and *Holothuroidea* certain of the organs or rays may shift so extensively with regard to the principal axis and the median plane that the original pentamerism becomes obscured. There is a well-developed coelom or body cavity and a closely connected "blood" or pseudohæmal system which consists of an axial organ or "heart," a circumoesophageal ring, radial vessels, and a more or less extensive system of lacunæ. In addition to the blood vascular system there is a very characteristic water-vascular system which, when typically developed, consists of a median madreporic or sieve plate and stone canal, a circumoesophageal canal bearing polian vesicles and other diverticula, and giving rise to radial canals which in turn bear rows of ampullæ and tube feet. The latter are the chief organs of locomotion, and the most important function of the water-vascular system is to provide for their distention by means of the water which is strained through the madreporic plate and enters the stone canal. In some cases the tube feet assume an exclusively respiratory function. With few exceptions the sexes are separate and, following fertilization in the water external to the body, a free swimming larval form develops, except in a few cases, from the egg. This is always bilaterally symmetrical, has a curved alimentary canal with mouth and anus, and a more or less complicated ciliated tract of cilia or separate circles of cilia, and a pair of coelomic pouches. Older larvae often develop irregular processes and a larval skeleton. The larvae of the several classes differ considerably in structural details and have been named auricularia, bipinnaria, pluteus, etc. The Echinodermata are exclusively marine. Four classes may be recognized, as follows:

Crinoidea, usually fixed to the sea bottom by the aboral surface; the mouth uppermost and the viscera all contained in the central disk or theca. When arms are present they are solid and usually branched. Stone lilies or crinoids. Here belong also the extinct blastids and cystids which are often regarded as forming separate classes.

Stelleroidea, never fixed to the sea bottom; the mouth or oral surface always in contact with the surface over which they are moving; tube feet confined to the oral surface; form stellate. There are two quite distinct sub-classes, the *Ophiuroidea*, or brittle stars, serpent stars, and basket stars; and the *Asteroidea*, or true starfish.

Echinoidea, never fixed to the sea bottom; ambulacral areas with the tube feet extending more or less over the aboral surface; form compact, more or less discoid or spheroidal. Sub-classes, *Regularia*, or regular sea-urchins; and *Irregularia*, or irregular sea-urchins.

Holothuroidea, never permanently fixed to the sea bottom; water-vascular system with a circle of oral tentacles; more or less elongated along the principal axis to a cucumber or wormlike form; skeleton in the form of separate plates or sometimes totally wanting. See CUCUMBERS.

For further information consult: Lankester, 'Treatise on Zoology,' (Part III.), and articles on the several classes.

Echinoidea, ĕk-i-noi'-de-a, or **Sea Urchins**, a class of *Echinodermata* with a more or less spheroidal or discoidal body enclosed in a continuous test or shell composed of polygonal pieces of various shapes accurately fitted together and arranged in radial rows. Alternating ambulacral and interambulacral areas, usually repeated five times, may be recognized. The former exhibit rows of perforations for the tube feet, generally reaching to the aboral pole. The skeletal plates support movable spines which sometimes attain a great size and are used in defense and to a certain degree in locomotion. In addition, the integument bears the remarkable structures known as pedicellaria, which are three-jawed pincers borne on movable stalks, which by continually snapping and bending carry away particles of faecal matter and secure cleanliness. The beginning of the digestive canal is frequently provided with a complicated masticatory apparatus known as Aristotle's lantern, and the canal itself is tubular and looped, usually not pouched. The gonads are interrational with outlets to the exterior near the aboral pole. Development may be direct or through the larval form called pluteus, which is provided in its later stages with long processes supported by movable spicules. The number of known Echinoidea is very great, many of them being fossil. There are two sub-classes:—*Regularia*, form regular, spheroid; mouth and anus at opposite poles of the central axis, and the latter usually surrounded by small skeletal plates; in only a few cases are external gills present. Here belongs the common sea-urchin (q.v.). *Irregularia*, form markedly bilateral; anus always displaced from the apical pole into the posterior inter-radius and the mouth frequently in the opposite direction, in which case the form is sometimes heart-shaped. Examples are the sand-dollar and heart urchin (q.v.).

Echinorhynchus, ě-kī-nō-rīng'kūs, a parasite worm. See **ROUNDWORMS**.

Echo, from the Greek, meaning "sound," noise; a sound repeated by reflection, or a sound heard again at its source. The waves of sound on meeting the surface are turned back in their course according to the same laws that hold for reflection of light. Even clouds are capable of producing echoes, as is observed at sea when a gun is fired off under a dense cloud. Echoes from the clouds also, in all likelihood, play an important part in the long rolling of thunder. In order that the echo may return to the place from which the sound proceeds the reflection must be direct, and not at an angle to the line of transmission, otherwise the echo may be heard by others but not by the transmitter of the sound. This may be effected either by a reflecting surface at right angles to the line of transmission, or by several reflecting surfaces which end in bringing the sound back to the point of issue. To make a distinct echo the reflected sound must be concentrated rather than diffused. To this result a degree of concavity in the reflecting body is conducive. If the sound is repeated several times, which is the case when it strikes against objects at different distances, many echoes are heard. The reflecting surface must be at a certain distance, in order that the echo may come to the ear after the sound, and be distinctly separated from it. Sound travels about 1,100 feet in a second; consequently, an observer standing at half that distance from the reflecting object would hear the echo a second later than the sound. Such an echo would repeat as many words and syllables as could be heard in a second. This is called a *polysyllabic* echo. If the distance is less, the echo repeats fewer syllables; if only one is repeated, then the echo is *monosyllabic*. The most practised ear cannot distinguish in a second more than from 9 to 12 successive sounds, so that a distance of not less than 60 feet is needed to enable a common ear to distinguish between the echo and the original sounds. Echoes at least distances, as from the walls of churches and public halls, are liable to mix with and destroy the distinctness of the original sound.

Echo, in classical mythology, a nymph (one of the *Oreads*), who, according to fable, was changed by Hera (Juno) into a rock, because her loquacity prevented Hera from listening to the conversation of Zeus with the nymphs. The use of her voice, however, was left her so far as to be able to repeat the last word which she heard from others. Another account is that Echo fell in love with Narcissus, and because he did not reciprocate her affection she pined away until nothing was left but her voice.

Echo Cañon, a gorge in northern Utah, not far from Salt Lake, through which the Union P. R. R. passes. The high almost vertical walls of the cañon have fantastic carvings made by the elements, principally water. The peculiar echo heard within the gorge has given it its name.

Echolalia, ěk-ō-lā'li-a, a peculiar form of verbal repetition which occurs in certain nervous, hysterical, and insane people. It consists in the ceaseless repetition of words that rhyme,

or apparently rhyme, or the continued utterance of some definite sentence or parts of a sentence. A like symptom termed *verbigeration* is frequently found in terminal dementias and allied mental states, and is to be distinguished from *echolalia*, which it closely resembles, by the repetition of meaningless and disconnected phrases. *Echolalia* is seen to best advantage in *hysteria* and in a peculiar type of mental disease known as *catatonia* (q.v.).

Echter, ěht'ēr, **Michael**, German painter: b. Munich 5 March 1812; d. there 4 Feb. 1879. He studied at the Munich Academy, as a pupil of Hess, Zimmerman and Olivier. He assisted Kaulbach in work on the mural paintings in the Berlin Museum, painted the 'Battle of Lechfeld' for the Maximilianeum; the 'Betrothal of Frederick Barbarossa with Beatrice of Burgundy' and 'The Burial of Walther von der Vogelweide' for the National Museum in Munich; and 30 scenes from the 'Nibelungenlied' for the royal residence. He was appointed professor in the School of Industrial Arts, and was a member of the Munich Academy.

Echtler, ěht'l'ēr, **Adolf**, German painter: b. Dantzic, Prussia, 1843. He studied at the Venice Academy under Karl Blaas, and at the Munich Academy, and took the gold medal at Berlin 1875. Among his works are: 'A Difficult Problem'; 'Peaceful Company'; 'Honi Soit qui mal y pense' (1877); 'Souvenir of Italy'; 'Those whom I have always loved' (1879); 'The Kiss' (1880); 'Neapolitans in Normandy'; 'In the Morning' (1881); 'Repentant Sinners' (1882); 'Ruin of a Family'; 'All is Vain'; 'Souvenir of Venice' (1884); 'Five Orphans' (1885).

Echuca, ě-choo'kă, Australia, town in the colony of Victoria, on a peninsula at the junction of the Campaspe with the Murray River. It is opposite Noama, in New South Wales. It has a trade, partly by the river, in timber, wool, and wine, and the vine is cultivated in the neighborhood. Pop. about 5,000.

Ecija, āthē-hă (Rom. *ASTIGI*; *AGUSTA FIRMA*), Spain, a town in the province of Seville, on the Genil, 42 miles northeast of Seville. It is of very ancient origin, and according to tradition was visited by the apostle Paul. At a very early period it became an episcopal see, and its importance under the Romans is attested by many ancient remains. The climate is so hot that Ecija is often called the "Oven of Andalusia." Pop. in 1887 23,615.

Eck (Eccius), **Johann Maier von**, a Catholic theologian, life-long adversary of Luther: b. Eck, Suabia. 13 Nov. 1486; d. Ingolstadt 1543. His father, a peasant named Maier, assumed the name Maier von Eck or Maier of Eck, after becoming bailiff of his village. Johann, at the age of 11 years, entered the University of Heidelberg whence he passed to the University of Tübingen and there at the age of 14 years took the degree of master of arts. He now successively at Tübingen, Cologne, and Freiburg universities studied divinity, jurisprudence, and mathematics, and at the same time was instructor in philosophy. He was appointed professor of theology in the University of Ingolstadt (1510). While on his travels in Italy (1515) he took part in a public disputation in

the University of Bologna and won high distinction; in 1516 on a similar occasion at Vienna he had a like success. In 1518 he published a pamphlet, 'Obelisci,' in defense of the Catholic doctrines attacked in Luther's celebrated 'Theses' of 31 Oct. 1517. Eck was now chancellor of the University of Ingolstadt and Luther put forward Carlstadt as a defender of the 'Theses'; Carlstadt not only replied to Eck in print, but challenged him to a public disputation. Eck accepted the challenge, and the disputation was held at Leipsic, with Eck as the champion of Catholicism against both Carlstadt and Luther. The disputation was commenced 27 June 1519, and lasted till 15 July. Upward of a year previously Luther in a letter to one of his friends credited Eck with eminent scholarship and great natural gifts, but after the disputation he was for Luther "a pitiful theologian" and "a miserable sophist." The numerous audience and the townsmen with unanimity awarded the crown of victory to Eck, and Luther in a private letter to his intimate friend Spalatinus, confesses defeat. Eck, stimulated by his success, devoted himself thereafter wholly to working for the overthrow of his adversaries. He procured from the universities of Cologne and Louvain a condemnation of Luther's writings and was honored at Rome with the commission to publish in Germany Pope Leo's bull *Exsurge Domine* against Luther. But he was received with manifestations of popular enmity almost everywhere; even at Leipsic the bull was solemnly committed to the flames by the students and the populace. On several notable occasions afterward—at the diet of Augsburg (1530), the conferences at Worms (1540) and those at Ratisbon (1541), he was again a principal champion of Catholicism. Some of his works are a German translation of the Old Testament, and a revision of Luther's translation of the New Testament. His pamphlets and books against the doctrines of Luther are included in 'Operum Johannis Eccii contra Lutherum.'

Eckels, James Herron, American financier: b. Princeton, Ill., 22 Nov. 1858. He was graduated at the Albany, N. Y., Law School 1880, and practised law at Ottawa, Ill., 1881-93. From 1893 till 1897 he was United States comptroller of currency. He is a Gold Standard Democrat, and president of the Commercial National Bank of Chicago.

Eckermann, Johann Peter, yō'hān pā'tēr ēk'ēr mā, German poet: b. Winsen, Hanover, 21 Sept. 1792; d. Weimar 3 Dec. 1854. He has a permanent place in literature through his record of 'Conversations with Goethe in the Last Years of his Life' (1823-32); which has been translated into nearly all the languages of Europe, even Turkish. He edited the 40-volume edition of Goethe's works (1839-40).

Eckert, Thomas Thompson, American telegrapher: b. St. Clairsville, Ohio, 23 April 1825. In 1852-9 he was superintendent of the telegraph line between Pittsburg and Chicago; in 1859-61 superintendent of a gold-mining company in North Carolina; and in the latter year was appointed superintendent of the military telegraph department of the Potomac, with the rank of captain. Subsequently he was general superintendent of the military telegraph of the army, and was brevetted brigadier-general of volunteers for his services. In 1864-6 he

was assistant secretary of war; in 1866-75 general superintendent of the eastern division of the Western Union Telegraph Company; in 1875-81 president of the American Union Telegraph Company, and in 1892 became president and general manager of the Western Union Telegraph Company. He retired in 1902.

Eckford, Henry, American naval architect: b. Irvine, Scotland, 12 March 1775; d. Constantinople 12 Nov. 1832. He became a ship-builder in New York, in 1796; designed and constructed a fleet of war vessels for the United States government in 1812-14; built the Robert Fulton, which made the first voyage by steam to New Orleans and Havana; became naval constructor at the Brooklyn navy yard in 1820; and built several war vessels for European and South American governments.

Eckhart, ěk'härt, Johannes ("MEISTER ECKHART"), the first of the German mystics in order of time and among the foremost in rank; the probable place of his birth is Cologne, and the year 1260 or a little earlier; d. 1329. He studied philosophy and theology in the University of Paris and joined the order of the Preaching Friars, or Dominicans, in which he was promoted to offices of high responsibility, for example, that of vicar-general of the Dominicans for Bohemia, provincial of the order in Saxony. In these places he effected many reforms in the houses of the order and was in high estimation as a preacher notwithstanding the abstruseness of his mystical speculations. Toward the end of his life this dissemination of his mystical views touching the nature of God and the relations between Deity and the human soul brought him under suspicion of being in sympathy with the Beghards, the Brethren of the Free Spirit, the Apostolic Brethren, and other fanatics, and 1327 he was cited before the court of inquisition at Cologne to make answer to charges of heretical teaching based on passages in his sermons. There he defended the inculcated propositions as entirely orthodox, but expressed his readiness to repudiate them if in the judgment of the head of the Church they were in conflict with the Church's creeds. In 1329 the decision arrived from Rome: 28 propositions contained in his sermons were condemned as heretical and Eckhart was ordered to recant; but he was now dead.

Whether these 28 propositions were or were not formally heretical, contradictory of the express teachings of the Church, they certainly contain doctrines that never have been put forth in any of the Church's formularies. However extravagant, they might have been tolerated or ignored, had they been entertained or discussed merely in the schools of theology and philosophy; but proclaimed from the pulpit and addressed to the common people, some of them ignorant, they were incitations to rebellion against all Church authority in teaching. His doctrine concerning the Godhead is plainly pantheistic-agnostic. For him there is no real being but God. God is the unknown and the unknowable. We cannot validly affirm anything of the Godhead; to predicate anything of Deity is to limit infinity. Yet though God is unknown and unknowable, and though we cannot predicate anything of him, still we can know the true God, the personal God, the Father; in this personal God, the Godhead it-

self. The triune God, Father, Son and Spirit, is evolved from the Godhead. And the Father comes to know himself in the Son; the return of the Son into the Father is the Spirit. In begetting the Son—who is coeternal with the Father—the Father brings into existence the universal world of things. Having gone to such lengths of mystic speculation it was well for his fame that he died before he was forced to recant. His death occurred a little while before the arrival of the Pope's condemnation of his doctrines.

Eckhel, ěk'ěl, **Joseph Hilary**, Austrian numismatist: b. Enzersfeld, Austria, 1737, d. 1798. After becoming a member of the society of St. Ignatius he was appointed keeper of the imperial cabinet of medals and professor of archaeology at Vienna. Eckhel may be regarded as the founder of the science of numismatics, the principles of which are elaborately developed in his treatise, '*Doctrina Nummorum Veterum*' (1792-8). He also published catalogues of the ancient coins and gems in the imperial cabinet.

Eckstein, ěk'stĭn, **Ernst**, German humorist, poet, and novelist: b. Giessen 6 Feb. 1845; d. 1900. From the university he went to Paris, and there completed his comic epos 'Check to the Queen' (1870), and wrote 'Paris Silhouettes' (1873), the grotesque night-piece 'The Varzin Ghosts,' and the 'Mute of Seville.' Later he wrote the stories: 'Margherita'; 'At the Tomb of Cestius'; 'The Mosque at Cordova.' He was editor of a literary and critical journal, 'Hall of Poets,' and of a humorous weekly, 'The Wag,' at Leipsic for some years, and in 1885 settled in Dresden. He also wrote 'The Claudii'; 'Aphrodite, a Story of Ancient Hellas'; 'Decius the Flute-player: a Merry Story of a Musician in Ancient Rome.'

Eck'storm, Fannie Hardy, American author: b. Brewer, Maine, 18 June 1865. She was graduated at Smith College 1888. She has published 'The Bird Book' (1901); 'The Woodpeckers' (1901).

Eclampsia. See PUERPERAL ECLAMPSIA.

Eclampsia Infantum. See INFANTILE CONVULSIONS.

Eclecticism (from the Gr. *ἐκ*, out of, and *λεγειν*, to choose or select) is a term that may be applied to any body of theories or doctrines that are combined without regard for their systematic coherence and real unity. We may thus find eclecticism in theology, in philosophy, in medicine, politics, or in the sphere of any of the theoretical sciences. The eclectic is usually guided by practical motives: he adopts from the various conflicting systems what seems to him the most plausible and useful opinion on this point or that, drawing now from one school, now from another. He is not concerned primarily with the systematic connection, or even the logical consistency, of these various doctrines with one another, but rather with the plausibility and practical applications of the views taken singly.

In philosophy there have been many men, both in ancient and in modern times—some of them writers of great popularity and influence—who, without attaching themselves to any particular system or forming one of their own, undertook to select from various quarters the particular doctrines that appeared to them to be true, and to combine them in their

teaching. This eclectic tendency was most prominent in the ancient world during the latter period of Greek philosophy, when the theoretical interest of earlier times had greatly declined, and when skepticism had infected many of the best minds. The differences between the three principal schools (Platonists, Peripatetics, and Stoics) began to be less emphasized and elements from one school were adopted by adherents of another. Moreover, a form of eclecticism appeared in Alexandria also, where thinkers like Philo sought to unite Hebrew theology with Platonic and Neo-Pythagorean conceptions. Cicero, who did more than anyone else to acquaint his fellow countrymen with Greek philosophy, was a thorough-going eclectic, troubling little about the systematic connection of the doctrines and selecting freely from the various schools what seemed to him true. In modern times, the school founded by the French philosopher, Victor Cousin, is known as eclecticism. Cousin sought to unite German idealism, as represented by Kant and his successors, with the Scottish philosophy of "common sense" and the doctrines of Descartes. Consult Zeller, 'Eclecticism in Greek Philosophy' (English trans. 1883); Janet, 'Victor Cousin et son Œuvre' (1885); Simon, 'Victor Cousin' (1887).

JAMES E. CREIGHTON,
Professor of Philosophy, Cornell University.

Eclecticism, a term applied at the present day to the principles and practice of an ancient as well as a modern school of medicine. It is derived from a Greek word meaning "to select" and was well applied to the ancient school. In the modern school, however, "selecting the best," has played but a minor part in comparison to doctrines originating within the school, such as the theory of specific medication, a doctrine distinctly its own. In the early centuries a number of distinct schools of medicine arose. Among these were the dogmatic, methodic, pneumatic, and empiric. From these arose the Eclectic, or episynthetic. The physicians of this sect wished it implied that they had made a rational selection of all that was best in the other medical schools. The practice of Aretæus, who, though not the founder, did the most to consolidate its doctrines, was simple, rational, and by far the most judicious of the ancients up to his time.

Modern Eclecticism, in the United States, embodies the principles and practice of the Eclectic, or American school of medicine founded by Dr. Wooster Beach in New York city, in 1825. It was first known as the American Reformed school. While it employs most largely remedies of vegetable origin it must not be confounded with Thomsonianism, a popular form of botanic practice taught and practised by Dr. Samuel Thomson in New England in the early part of the 19th century, the peculiar theories and extreme measures of which were never adopted by the Eclectics. Among the most bitter antagonists of the latter were the followers of Thomson. As students and developers of indigenous materia medica the American Eclectic practitioners have been the most assiduous in all history, and in this field they have won the admiration of the rival schools of medicine. The majority of Eclectics of the present day adhere to the doctrine of specific medication, the basic theory of the

ECLIPSE

modern school, promulgated by Dr. John Milton Scudder, of Cincinnati, Ohio, in 1869. The Eclectic or American school of medicine of today is distinctively a school of specific therapeutics. (See MEDICINE, ECLECTIC.)

H. W. FELTER, M. D.

Eclipse (Gr. *ἐκλειψις*, from *ἐκλείπειν*, to forsake the accustomed place, to fail to appear), an obscuration of the light of a heavenly body by another, effected either, directly, by its intervention between the body and the observer, or, indirectly, by its interception of the source of light which illumines the body. The earth, by means of its shadow, may indirectly cause an eclipse of the moon. Similarly, eclipses of the Jovian satellites are caused by immersion in the shadow of Jupiter, and for the system of Saturn a more complicated result arises on account of its ring. When the shadow of a satellite falls upon either of these planets it is called a transit of the shadow. Eclipses are not observable in the other planetary systems, since, in the case of Mars, the satellites disappear in the light of the planet, and with the more distant planets the shadow cone extends too slight a distance beyond the disk. Again, our moon can by its direct interposition between the sun and the earth produce eclipses of the sun. Similar occurrences are observed in the Jovian and Saturnian systems and are then called transits of the satellites, but in the outer planets have not as yet been observed. The moon may interpose itself between the stars or planets and occult them (see OCCULTATION), and the other bodies of the solar system may act similarly. The eclipses of the sun by the inner planets are designated transits (see TRANSITS), but the obscuration of satellites and stars by the disks of planets are called occultations. The most important of these phenomena are the eclipses of the sun and moon.

Eclipses of the Moon.—A lunar eclipse is caused by the interposition of the earth between the sun and the moon and the moon's consequent immersion in the shadow of the earth. This can occur only when the moon is in opposition to the sun on the heavens, at the time of full moon, and both sun and moon are near the moon's nodes, i. e. the points where her orbit crosses the plane of the ecliptic. Let the sun, earth and moon be regarded as spherical bodies and their centres ranged in a right line. Then the sun will project beyond the earth a conical shadow called the *umbra*, in which the moon is centrally immersed. The surface of this cone will be described by a line tangent to the same side of both sun and earth and moving about the line joining their centres. The apex of the shadow cone, or of the *umbra*, is on the average about 157,000 miles beyond the earth's centre, and the diameter of the umbral cone at the point where the moon crosses it on the average about two and two thirds the diameter of the moon, with a variation from scarcely twice to more than three times the lunar diameter. If, again, two lines tangent on opposite sides of the sun, and crossing between sun and earth, move about the line joining the centres of these bodies, these lines will describe the surface of two cones of which the one extending beyond the earth is that of the *penumbra*. Unless the moon be near one of her nodes at the time of full moon, she will not strike the shadow, but pass

below or above it. If the sun is less than 4 days from a node of the moon's orbit, an eclipse must occur; if more than 14 days from a lunar node, an eclipse is impossible. These are called the lunar eclipse limits. Since the moon must be quite near her node to produce a lunar eclipse, it may happen that an entire year may elapse without an eclipse of the moon. The lunar eclipses may be either partial or total according as the moon is immersed either partly or entirely in the earth's shadow cone. The phenomena of a total lunar eclipse are of a simple character. The immersion of the moon in the penumbra can be observed only with difficulty. The edge of the shadow itself presents a hazy outline when seen in a telescope, and the times of contact cannot be observed with accuracy. When completely within the earth's shadow, the moon is usually still plainly visible in a dull copper-colored illumination which is produced by the sunlight shining through the earth's atmosphere, suffering absorption of its higher tints, and experiencing deflection into the shadow cone through refraction. Lunar eclipses have, however, occurred in which the moon was almost entirely invisible during the total phase. The obscuration of the earth's atmosphere by clouds accounts for these dark eclipses. Specially bright lunar eclipses have, on the other hand, been attributed to terrestrial auroras occurring at the same time. The most interesting physical observations effected during its eclipse concern the luminous and heat radiations of the moon. Valuable astronomical observations then possible are the determinations of the times of occultation of faint stars whence precise values of lunar position, diameter, and parallax may be derived.

Eclipses of the Sun.—Solar eclipses can occur only at the time of new moon. If the sun be more than 19 days from a node of the moon's orbit, an eclipse is impossible, if less than 10 days, a central solar eclipse is inevitable. These are the solar eclipse limits. The sun causes the moon to project toward the earth at new moon, umbral and penumbral shadow cones differing in the main only in size from those which the earth projects toward and beyond the moon at full moon. The method of conceiving the generation of the shadow cones of the umbra and of the penumbra are the same in solar as in lunar eclipses if the moon be substituted for the earth. The shadow cone of the moon may strike the earth's surface, but on the average does not. Two distinct cases may arise. First, the axis of the shadow cone strikes the earth's surface, and upon it the right line joining the centres of the solar and lunar disks, traces the curve of centrality. Here three cases result: (1) The apex of the shadow cone reaches the earth's surface and a central *total* eclipse occurs. (2) The apex of the shadow cone does not reach the earth's surface and there occurs a central *annular* eclipse. (3) The apex of the shadow cone reaches the earth's surface only at a middle stretch of the curve of centrality and there occurs a central *annular-total* eclipse. Secondly, the axis of the shadow cone does not strike the earth's surface but the earth still enters the shadow cone, or shadow cone produced, and there occur total, annular, and annular-total eclipses, all of which are of a non-central character. The

ECLIPSE

path of a total eclipse on the earth cannot exceed 167 miles in width and is often not over 135 miles, but it may traverse a length from west to east of several thousand miles. An annular eclipse has also a "path of the annulus" in which the annular phase is visible. Outside of both of these paths the sun is only partially eclipsed. The least number of eclipses, solar and lunar, which can occur in a year, is two, and these must be central eclipses of the sun, while the maximum number occurring is seven, two of the moon and five of the sun. The average number hardly exceeds four. The minimum number of two eclipses is determined by the fact that the sun in its annual path crosses both nodes of the moon's orbit. The retrograde motion of the moon's nodes around the ecliptic continually changes the two eclipse seasons of the year, and is also responsible for the famous cycle of eclipses discovered and used long before its physical explanation was possible. A simple record of the date and character of the eclipses revealed to early astronomers the fact that after a period of about 18 years, eclipses again recur in the same order and kind whether solar, lunar, total, or partial. This cycle, called the saros, is one of 223 lunar months, each of a little more than 29.5 days, and is precisely 6,585.32 days in length. Depending on the number of leap years, 5, or 4 intervening, this is equal to 18 years, 10.32 days, or 11.32 days. At the end of the saros, the relative positions of the sun, moon, and node of the moon's orbit are nearly the same as at the beginning, and other favoring factors of the motions of the sun and moon also recur, as Newcomb first pointed out, to nearly original values. The excess of one third of a day in the cycle causes the eclipse to be thrown about eight hours of longitude farther west on the earth's surface. Hence only after three cycles does the eclipse again recur in approximately the same longitude. If the intervening leap years be regarded, the application of the saros to various series of solar eclipses of the following table may readily be made.

Ancient eclipses are chiefly of value in historical and chronological investigation (see TIME). The records of the supposed eclipses of the ancient historians are usually very uncertain as to place, time, and character of the occurrence, and hence have proved of questionable value to the astronomer. The precise circumstances of an eclipse occurring centuries ago can readily be computed from the modern tables, but the comparison with the vague historical references has apparently contributed but little to science. Ginzell has, in his 'Special Canon of Eclipses,' collected a splendid array of ancient eclipse literature, and this has been used to derive corrections to the lunar tables, but Newcomb seems justly to question the validity of the results. The eclipses observed by the older astronomers and carefully recorded are of great value. And in later times the description of eclipses has been so accurately interwoven with even historical accounts as to furnish unquestionable data for chronology. The terror and apprehensive uncertainty associated with an eclipse in ancient times has given place to a lofty appreciation of the grand occasion, and to a careful and inspiring scientific study of the phenomena.

The annexed table of total solar eclipses

occurring during the present century has been prepared with the aid of the memoirs of Oppolzer and Mahler, and is a complete list of all the eclipses of the century having a total phase, however brief. The first column gives the date for the point on the earth where at noon the eclipse is central. The second column gives the Greenwich civil time of the conjunction of the sun and moon in longitude. The next column states the greatest interval in minutes during which the most favored place may experience the total phase. The fourth column gives the latitude and longitude of the place where the eclipse is central at noon. The last column indicates the areas traversed by the moon's shadow. Several of the eclipses, occurring in the polar regions, have no noon-point and hence, for these, the place of the beginning or end of the eclipse, lowest in latitude, is placed in the fourth, and the corresponding time, sunrise or sunset, in the last column. The nine annular-total eclipses of the century are indicated by a *, and in these the duration of total phase may be but a few seconds. Two of the list, namely 1928 and 1967, are non-central in character, the moon's shadow just grazing the pole of the earth.

It is not likely that the brief duration of total phase of a number of these eclipses will bar their astronomical use, particularly in the direction of spectroscopic and photographic investigations. The ever increasing importance of a thorough study of the rare and intricate phenomena of total solar eclipses, attested alike by the marvels still awaiting explanation, and by the progress already made, demands that every second of totality available shall be turned to the highest scientific uses.

The Phenomena Observed in Total Solar Eclipses.—As totality approaches, a pale purple coloring spreads over the landscape. Within a minute of the total phase the phenomena begin to succeed each other so rapidly that no single observer can note them all. By those glancing at the landscape in the direction of the approaching shadow a majestic darkness will be seen to sweep forward with a swiftness truly impressive. Those looking at the earth, and away from the eclipsing sun, will see a succession of flitting bands, alternately dark and bright, known as the *shadow bands*, which for many decades remained an unexplained puzzle. About 15 seconds before the total phase, the moon, with its sharp irregular outline, due to the elevations and depressions in its surface, will have diminished the solar crescent to such an extent that the remnant of it usually begins to be crossed by black lines,—the mountains on the moon's edge connecting the limbs of moon and sun. Then it rather suddenly presents the appearance of a string of detached brilliant points, irregular in size and spacing. These are the well-known *Baily's beads*, seen by Francis Baily on the occasion of the annular eclipse of May 15, 1836, and in an extended memoir on the remarkable phenomenon fully described. The explanation of the appearances was rightly suggested, as due to irradiation which alike exaggerates the length and thinness of the projected lunar mountains and the size of the resulting bright points or *beads* of the disappearing solar crescent. On each side of the point of disappearance, the chromospheric arc may be observed as a scarlet "sierra."

* Annular Total Eclipses.

ECLIPSE

Totality, the appearance of the prominences, whether *red* or *white*, along the moon's edge, and the presence of the radiant, outspreading corona, are simultaneous. The phenomena of the earlier eclipses were recorded in the most general manner. Hasty drawings of the streamers of the corona, accompanied by descriptions reflecting but the dawn of scientific method, are the chief results. It was not until the application of the spectroscope and the photographic camera that the astronomer attained real insight into the stupendous phenomena.

The great eclipse of July 8, 1842, may be said to mark the beginning of serious and accurate attention to the complex physical features of total solar eclipses. Then the path of totality swept from Spain across France, Italy, Austria, Russia, and central Asia, and thus permitted many expert European astronomers to view and record the marvelous phenomena. It is noteworthy that in reports of this eclipse the red solar prominences were first described with precision, three large ones having been seen on the upper edge of the moon. The corona was also described as of a brilliant white luminosity and extending at least 15' from the moon's edge. Among the many phenomena observed, the objects of special speculation were the newly discovered *red flames* or *protuberances* which Baily considered as "evidently forming a portion of the corona," and no less an authority than Airy, who had observed the eclipse through clouds, attributed to "some irregularity in the density of the cloud's edge."

The total solar eclipse of July 28, 1851, carrying the moon's shadow across Greenland, lower Sweden, and Russia, is notable as being probably the first for whose observation distinct aid was given by government authority, since with the assistance of the admiralty, the British astronomer royal, Airy, was able to conduct an important expedition to Sweden. Both the corona and the prominences were observed in greater development than in 1842, and by several observers a scarlet *sierra* or reddish arc of light was noted near those parts of the lunar disk where the rays of the sun had disappeared, or else were about to appear. The observers for the most part became certain that the prominences were true solar appendages, because they were apparently uncovered by the moon's edge on the western edge, and extinguished on the eastern limb. A precious photographic achievement was the single successful daguerreotype taken by Barowski with a telescope of 2.4 inches aperture, attached to the Königsberg heliometer, and with an exposure of 84 seconds. It distinctly pictured the corona and several prominences, and thus became the first unchallenged record of these features of an eclipse.

It was, however, at the eclipse of July 18, 1860, which traced its total path across northern Spain, the Mediterranean, and northeastern Africa, that photography was first applied with marked scientific success. Mr. Warren De la Rue, stationed at Rivabellosa with the Kew photo-heliograph, and Padre Secchi, at Desierto de las Palmas, with the Cauchoix refractor, each secured good representations of the prominences; the former also faint traces and the latter good portrayal of the corona. Comparison of these photographs set at rest, once for all, any doubt

still existing as to the true solar character of the prominences. The moon was undeniably shown to pass over them, and all the speculation which had attributed these strange scarlet projections either to lunar, or to terrestrial origin, was at an end. Many sketches of the corona, or of parts of it, had been made during this eclipse, some showing its extension to fully one degree. But Padre Secchi's plates, although depicting the corona as scarcely a quarter of a degree in width, exhibited the whole of it in great delicacy of tone and as traversed by curious dark rifts. The method of making hasty sketches and drawings of the corona had, as shown by the results of this and previous eclipses, brought no end of contradiction and had permitted comparison only in some of the most pronounced features. It was therefore destined more and more to fall into discredit, and to have its results accepted only as rude and preliminary. The photographic method of attacking the problems arising in total solar eclipses was from this time firmly established. Its progressive development was determined chiefly by three elements: First, increase in the sensitiveness of the plates; second, knowledge of the exposure times required; and third, necessary advancement in practical optics. The gelatin emulsion process introduced by Madox in 1871, and given the touch of great sensitiveness by Bennett, in 1878, secured the first. Successive failure and success, coupled with scientific method in photometric study, brought the second. And, finally, refined theoretical discussion of the principles of optics as applied to celestial photography, coupled with marked improvements in optical manufacture, supplied the third. So that now by separate and regulated exposures, with specially designed instruments, either the outer long, delicate, coronal wings may be pictured to an extreme limit, or the intensely brighter parts of the inner corona, shown with all their involved filaments and rich tracery, and with many a curious relation to the prominences and chromosphere.

The unknown nature of the brilliant red prominences, boldly projecting beyond the moon's edge during an eclipse, had for a quarter of a century remained an unaccepted challenge. And hence the first and highly successful application of the spectroscope to their study during the total solar eclipse of Aug. 18, 1868, will always be memorable. Tracing its course across the Indian and Malayan peninsulas, and affording a total phase of more than five minutes and a half, this eclipse was spectroscopically observed by Janssen, Major Tennant, Lieutenant Herschel, Pogson, and Rayet. The light of the prominences was recorded by each of these experts as consisting of several bright lines clearly indicative of the gaseous nature of those remarkable objects. The hydrogen lines C and F were certainly identified, and a yellow line, thence to figure famously in astronomy as D₃ and as due to *helium*, was too hastily assigned to sodium. Another notable result of this eclipse was the discovery, by Janssen, of a method by which the bright lines of the prominences could be observed apart from any eclipse whenever the sky was sufficiently clear. "During the total obscurity, I was struck by the vivid splendor of the light of the protuberances; the thought immediately came to me that it would be possible to see them irrespective of eclipses," his

ECLIPSE

famous report begins. On the day following the eclipse he was able successfully to apply the new method; to demonstrate beyond controversy that the bright lines of hydrogen prevailed in the protuberances; and to make a third discovery always to be associated with this great Indian eclipse, namely, that of pronounced and rapid changes of form occurring in the prominences. Lockyer in England had for some time been at work on the same method for observing the bright prominence lines, and his final success was reported to the French Academy at the same meeting at which Janssen's achievements were announced. The coincidence was evidently rather determined by the progressive advancement of spectroscopic science than by accident. Huggins, who had previously indicated the theory of the Janssen-Lockyer method now suggested the widening of the spectroscopic slit as a means of disclosing the entire form of a prominence in a spectroscope of considerable dispersive power. The spectrum of the corona of this eclipse was generally observed as a faint continuous one without lines dark or bright. Rayet, indeed, noticed a certain bright line near E as extending above the prominences. The polariscopic observations of Lieutenant Campbell and Captain Branfil proved that the coronal light was polarized in planes passing through the sun's centre. The inference thus seemed doubly plain that some solar light was reflected by the corona, although the absence of the dark Fraunhofer lines required explanation.

The path of the moon's shadow during the total eclipse of August 7, 1869, lay diagonally across North America from Bering's Strait to North Carolina. The spectroscopic observations made in Iowa, at Burlington by Professor Young, and at Des Moines by Professor Harkness, established the existence of a bright green line crossing the continuous spectrum of the corona. It was estimated by the former as coincident with an iron line at 1474 of Kirchhoff's scale, or of a wave-length (λ) of 5317 ten millionths of a millimetre; and by the latter as at $\lambda 5300 \pm 14$. Professor Young's reading for the line of the unknown *coronium*, as it came to be designated, was practically that of a bright chromospheric line of approximately the same wave-length, shown by his observations some time prior to this eclipse. Young in 1876 by means of a higher dispersion proved 1474 K to be double. But it remained for the photographic records of the powerful spectrographs applied to the eclipses of 1866 and 1898 to furnish the data according to which Lockyer, Campbell, and Evershed could place the famous coronal line definitely at $\lambda 5303$ and thus separate it from its neighbor in the chromosphere.

The eclipse of December 22, 1870, trailing its path of totality over southern Spain, Sicily, and Greece, was of particular interest to the American observers who had studied that of 1869, and this resulted in the despatch of two large parties to Europe, one directed by the United States Naval Observatory and the other by the officers of the Coast Survey. If there remained any doubt as to the gaseous nature of the inner corona it was to be dissipated by the fine drawing and description of the inner corona furnished by Professor Watson of Ann Arbor, stationed at Carlentini, Sicily, and observing this gaseous shell to an elevation of about 5'; and by Profes-

sor Young's observations in Spain at Jerez de la Frontera, of the now familiar green line of coronium, visible plainly in this area, and traceable as far as 16' from the solar limb. The bright hydrogen lines C and F and the helium line D_3 were seen projected on the moon, and also about 5' outside of the lunar limb by Young. Plainly the light of the prominences and chromosphere must have been reflected from the earth's atmosphere, and possibly also from the corona itself, and commingled with its intrinsic radiation. This eclipse will, however, always be peculiarly famous for Professor Young's discovery of the *reversing layer* as a thin shell lying immediately above the photosphere. Kirchhoff's theory had demanded the existence of a solar atmosphere of vapors above the photosphere, which by its elective absorption should produce the dark lines of the solar spectrum. Janssen had expected to see the reversed solar spectrum in 1868, but in his notable report was obliged to say: "It must be admitted either that this atmosphere does not exist, or that its height is so meagre that it has escaped observation." Peculiarly interesting then for this time, and for the future, was Young's observation of a sudden bursting forth, at the disappearing solar edge, of innumerable bright lines having the general arrangement of the familiar dark lines of the spectrum. The existence of the reversing layer has since 1870 been repeatedly verified visually, and more recently by photographic records. The layer comprises an envelope of glowing vapors of an estimated depth of about 600 miles lying at the base of the chromosphere. Its thinness causes the bright lines to appear for but a few seconds, or as a brief *flash*, unless the observation be made at some station near the edge of the lunar shadow. Photographs of this eclipse taken by Willard in Spain, and by Brothers in Sicily, exhibited the corona as divided by the same rifts as shown in Watson's drawing, and, although differing in extent of corona depicted, markedly agreed in all details to be expected in plates exposed for different intervals and in cameras of widely different light-grasp. Incidentally the advantage of large angular aperture in a camera intended to trace the considerable extent of the corona became evident. In photographs by Brothers, at Syracuse, the corona was traceable to a height of at least 40' above the sun's limb.

The eclipse of December 12, 1871, whose path lay across southern India, and northern Australia, was photographed with similar instruments according to a consistent plan by Davis at Bakkal, and Tennant at Dodabetta, and these photographs subsequently studied with consummate skill by Ranyard and Wesley, and the delicate results reproduced in detail with masterful accuracy. (Vol. XLI., 'Memoirs Royal Astronomical Society.') Here for the first time was available a representation of the corona in all its complex glory of spaced polar rays, dark rifts, filaments straight, curved, and interlacing, and of stupendous *synclinal* structures with rich nebulous mottling. The delicate portrayal of the wet-plate process was only equaled by the scientific and artistic appreciation of Ranyard and Wesley in integrating the noble results. Double charm and value was added to the photographic achievements by the vivid and accurate descriptions of the corona

at Baikal by Lockyer, at Dodabetta by Captain Herschel, and at Shoolor by Janssen. In the spectrum of the corona four hydrogen lines and 1474 K were seen both by Lockyer and Janssen, and in it the latter also found the dark line D and several faint dark lines in the green.

The eclipse of April 16, 1874, was visible only in southern Africa, and observed at Klipfontein by Mr. E. J. Stone, the astronomer royal of the Cape Observatory. He confirmed Young's observation of the reversal of the Fraunhofer lines near the photosphere, and traced the main, green coronal line to more than a degree from the moon's edge. The corona exhibited extended equatorial wings, covering in some parts more than three lunar diameters. The spectroscopic character of the corona, and its unchanged features, as viewed from different stations in Africa, led Stone to insist on the solar origin and cosmical nature of the outer corona.

The eclipse of April 6, 1875, traced its total path across Siam and French Indo-China, and in the former country was observed by Lockyer, Schuster, and Janssen, who obtained photographs of the corona showing that its extent increased rapidly with increasing times of exposure. Photographs were also secured with a prismatic camera which for the upper corona gave apparently H γ , and for the lower parts of the corona, a strong continuous spectrum. The corona was of a type similar to that of the previous year, exhibiting a marked symmetry, and four synclinal groups making angles of more than 45° with the sun's axis.

The path of the total solar eclipse of July 29, 1878, lay diagonally across North America from Bering's Strait to the Gulf of Mexico, and afforded a memorable opportunity to many American and foreign astronomers. The direction of the line of totality across the Rocky Mountains permitted several astronomers to observe the phenomena at extraordinary altitudes. Langley on Pike's Peak, at an altitude of 14,100 feet, traced the corona in the direction of the ecliptic for a distance of at least 12 lunar diameters, and felt great confidence in saying that this, though covering a range of over 10,000,000 miles, was "but a portion of its extent." The eminent astronomer Newcomb, although observing at a lower level, Separation, Wyoming, made his very careful estimate of the length of these coronal wings "as six degrees from the disk." The polar rays and filaments of the inner corona received careful study from such experienced observers as Ormond Stone, Boss, Paul, Trouvelot, and Upton. The dry-plate photographs obtained by Professor Hall's party at La Junta, and by Professor Harkness' party at Creston, were in remarkable agreement as to the details of the inner corona, the same intensities of shading, to great delicacy, being in common, and the pronounced filamentous character of the polar rays, as well as the marked curvature and brightness of the equatorial extensions being clearly shown in both sets of plates. A photograph made by a member of Professor Holden's party by means of a small camera showed the east wing of the corona as extending 50' from the moon's edge. It was the concurrent opinion of many observers that although the corona exhibited vast wings, it lacked, particularly in its inner portions, the brilliancy of the corona of 1869.

As to the spectroscopic observations made by himself and others, Professor Young distinctly announced that they demonstrated a profound modification of the coronal spectrum: the bright lines of former eclipses, especially the 1474 K, having proved to be very faint and difficult of observation. The gaseous corona manifested, as it seemed, a pronounced sympathy and intimate relation with the eleven-year sun-spot period, giving faint spectroscopic lines at the minimum, 1878, and brilliant ones at the maximum, 1869, 1870, and 1871, of the period. Ranyard in his report on this eclipse, inspired by his recent observations and by his former masterful study of previous eclipses, made the deduction that "a greater development of the corona in the equatorial than in the polar regions is one of the characteristics of coronas which have been observed during periods when there were few sun-spots." The search made by Watson and Swift for an intra-Mercurial planet proved to be doubtful in result.

The total eclipse of May 17, 1882, visible in the Sudan, upper Egypt, and across to China, was in Egypt observed by Sir J. Norman Lockyer, Professor Schuster, Professor Tacchini, and by a French expedition equipped by M. Bischoffsheim. The photographs of the corona reproduced the form which it had in 1871, also near a sun-spot maximum, being most extended at points away from the solar equator and with no special structure at the poles. It was thus distinguished from the coronas of 1878 and 1867: near sun-spot minima, which were greatly elongated along the sun's equator and of marked structure at the poles. A striking object was a bright comet near the sun, photographed, as well as observed by the naked eye, and the first discovered on such an occasion. The spectral lines, C, F, D α , H, and K, were observed in the corona. A photograph made by Lockyer with a prismatic camera gave continuous rings corresponding to 1474 K and D α for the corona. Professor Tacchini, through observations made during the eclipse on the size of the prominences, found that these appeared approximately twice as high and twice as wide at the base as the same prominences had prior to the eclipse, as observed by himself in Egypt, and by Professor Ricco at Palermo.

The eclipse of May 6, 1883, carried the track of the moon's shadow across the south Pacific. It was observed from Caroline Island, an atoll in the Polynesian group, by a number of astronomers from Europe and America. Professor Holden was in charge of the American expedition, and devoted himself to a careful search, during the long totality of 5 minutes 23 seconds, for an intra-Mercurial planet, with a negative result. Palisa of Vienna, assisted by Trouvelot, also engaged in the same search, and with like result. Professor Hastings having under view simultaneously the spectra of the eastern and of the western sides of the corona, observed the green line at beginning of totality as extending brilliantly about 12' from the eastern limb, but fainter and about 4' from the western limb; and at the end of totality these conditions reversed. He also saw the D line dark in the corona. Janssen, devoting himself specially to the detection of the dark Fraunhofer lines in the coronal spectrum, saw not only the principal lines, notably B, b, E, etc., "so marked that there was

ECLIPSE

no possible doubt in that respect," but all told, "about 100 lines." Tacchini observed two lofty, finely silvered sheaves which he designated, *white prominences*, "protubérances blanches." He also thought he had detected the cometary carbon bands in the coronal plumes.

The eclipse of September 9, 1885, was visible on land in New Zealand only, and owing to bad weather yielded scarcely any scientific result. The corona was of a stellate character, the streamers extending in many directions. A brilliant prominence reported as *white* as well as *red* by different observers shot out near the main rift.

The eclipse of August 29, 1886, was visible in its total phase in a path extending from the Isthmus of Panama, across the Atlantic Ocean, and South Africa, to the Indian Ocean. It was observed by American, English, and Italian astronomers in the West Indies. Professor W. H. Pickering, of the Harvard College Observatory, made a valuable investigation in the photographic photometry of the corona, the result of which led Holden to employ a similar method in the two eclipses of 1889. The values obtained are given in connection with the later eclipses. The Harvard photographs of the eclipse were taken with a variety of cameras, the short exposures giving the details of the inner corona, and one, of long exposure, showing the corona as extending 90' from the moon's limb. In the largest prominence of the eclipse, rising in a somewhat spiral form to the altitude of 150,000 miles, W. H. Pickering photographed only H and K lines with a faint trace of an ultra-violet line, while in the other prominences the hydrogen lines also were present. By means of this prominence Tacchini verified his discovery of *white* prominences and immediately announced to the Academy of the Lincei at Rome: "That during a total solar eclipse of the sun there may be seen most beautiful prominences not visible in full sunlight; that the prominences visible only during totality are white, especially in their more elevated parts, and have a special filamentous character, the threads being thin, long, and blunt at the top; that the luminous intensity of the white prominences is feeble, and for this reason they are not visible to the naked eye, unless their height surpass that of the more brilliant parts of the corona; and that the other prominences visible in full sunlight appear much wider and higher in a total eclipse, and,

spectrum showed many lines which on comparison with those of 1882 exhibited a great alteration in intensity. The hydrogen lines were visible in the corona only in the parts overlying strong prominences, while the H and K lines, though elsewhere visible, were stronger on the side of the corona having many prominences at its base. A drawing of the corona by W. H. Wesley, and one of the richest products of this eclipse, is based on seven negatives by Maunder, and five by Schuster, and exhibits a stellate distribution of the streamers.

The eclipse of August 19, 1887, whose line of totality lay across Russia and Japan, was notable for the extensive and complete preparations made to observe it, and for the general failure through cloudy weather. In this disappointment shared Struve's plan of measuring the precise ratio of the apparent lunar and solar diameters by means of a series of co-operative observations along the northern and southern boundaries of the shadow. A comparison of photographs of the corona taken at Petrovsk, Russia, and those taken two hours later at Youmey-i-yama, Japan, was probably too careless to prove the supposed displacement of one of the streamers.

The total eclipse of January 1, 1889, was visible in a path that lay across California and Nevada, and was successfully observed by many American astronomers. The photographs taken are notable alike for the fine detail of the inner parts of the corona registered, and for the immense extent of the streamers imprinted. A particularly fine negative by Barnard permitted Holden to trace rays similar in typical character to the polar rays all round the limb of the sun and to present a detailed study of the filamentous character of the corona. Professor Holden also drew the conclusion that: "Coronal forms seem to vary periodically as sun-spots and auræ, and the coronas of 1867, 1878, and 1889 are of the same strongly marked type"; thus confirming Ranyard's previous deduction. Professor Charropin's negatives disclosed the corona out as far as 100' or more, and confirmed many of Barnard's delicate details in the filaments and the trumpet-shaped extension of the outer corona. The outlines of the coronal wings were shown in the photographs of Ireland and Lowden as far as 135' and 165' respectively. Señor Valle was able to trace the streamers, with the naked eye, to a distance of more than three degrees. The coronal spectrum was character-

Photographic Photometry of the Solar Corona	August 1886 Pickering	January 1889 Holden	December 1889 Holden
Intrinsic actinic brilliancy of the brightest parts of the corona.....	0.031	0.079	0.029
Ditto of the polar rays.....	0.053	0.016

when of considerable height, have their summits white." Captain Darwin, using an instrument designed by Huggins for testing the possibility of obtaining photographs of the corona at other times than during eclipses, secured negative results. Schuster's photographs of the coronal

by simplicity and consisted of few lines other than those of coronium and hydrogen.

The eclipse of December 22, 1889, was observed by Burnham and Schaeberle at Cayenne, South America, and by Father Perry in the Salut Islands, French Guiana. This devoted astrono-

ECLIPSE

mer died, a few days after the eclipse, from the exposure to the dangerous malarial climate. The American and English expeditions at Cape Ledo, Africa, experienced cloudy weather. The main results of the measures in the photographic photometry of the corona made by Professor W. H. Pickering in 1886, and those deduced by Professor Holden from the eclipses of January and December 1889 are based on a standard giving fairly comparable results, and are presented in the preceding table. The photographs of January 1889 are the only ones of the group taken in a clear sky, and this the photometric results clearly indicate.

From a thorough study of his photographs of the eclipse of 1889, Prof. Schaeberle published 'A Mechanical Theory of the Solar Corona,' in which he holds that the "corona is caused by light emitted and reflected from streams of matter ejected from the sun by forces which, in general, act along lines normal to the surface of the sun; these forces are most active near the centre of each sun-spot zone." "The perspective overlapping and interlacing of the streamers cause the observed apparent variations in the type of the corona." From a study of his plates of the eclipse of 1893 he so modifies his theory as to conclude that the stream lines of the corona coincide with "elliptical arcs having one focus at the sun's centre; the origin of the streams being, in the main, confined to the spot-zone regions." Professor Schaeberle applies his theory to the location of half a dozen solar areas productive of the actual streamers photographed in the eclipse of 1893. Whatever the merit of the particular theory, it has had the advantage of pointing out the importance of dynamical and spatial study of the coronal streamers.

The eclipse of April 16, 1893, traced its course of totality from Chile northeast across South America and the Atlantic Ocean into West Africa. It was observed both in Africa and Brazil by English and French astronomers. At Mina Bronces, Chile, Professor Schaeberle, of the Lick Observatory, as Bigelow and Davis in 1889 at Cape Ledo, employed a long focus telescope (5 inches aperture and 40 feet focal length) in the photography of the corona. This he set up in the direction of the computed place of the eclipsed sun and obtained notable delineation of the protuberances and the corona near the solar limb. A comet formed a fairly conspicuous feature of the corona on Professor Schaeberle's plates. Professor Hale, from a detailed comparison of photographs of the prominences made in full sunlight by himself at Chicago, and of eyetracings made by Fényi at Kalosa, with those taken during this eclipse by Schaeberle in Chile, and by Fowler at Fundium, Africa, demonstrated the resemblance of the prominences as photographed in the K line to those of the eclipse, and marked differences in those as seen in H α . Professor Hale also indicated that the *white* prominences probably appear so from the intense character of the H and K light. Prismatic cameras of considerable light-grasping power were used by Fowler in Africa, and Shackleton in Brazil, and from a comprehensive discussion of the photographs, Lockyer concluded that the spectrum of the corona in 1893 consisted, besides that of coronium with a wave length of 5303, of at least seven rings of $\lambda\lambda$ 3087; 4086; 4217; 4231; 4240; 4280; and 4486, which had also

been seen in slit spectroscopes in 1886 and at other eclipses. The H and K lines, as well as those of hydrogen and helium, seen hitherto in the corona, by a number of observers, must therefore be attributed to a scattering of the prominence light by the earth's atmosphere, and possibly by the corona itself but not to the intrinsic coronal light. The English photographs also permitted the determination of the wavelengths and intensity of several hundred chromosphere and prominence lines. Abney and Thorpe made photometric observations of the corona which disclosed a close agreement with those made by them in 1886, and indicated a brightness of the corona not dissimilar in both eclipses. Deslandres sought to determine the rotation of the corona by photographing its spectrum on both sides of the sun, but through his use of the H and K lines only, his result, of a speed almost equal to that of the solar surface and corresponding to a distance of 20' from the limb, cannot be regarded as conclusive. De la Baume Pluvinel photographed at least 15 Fraunhofer lines in the coronal spectrum, and thus confirmed Janssen's previous observation. The form of the corona was described by several astronomers as that peculiar to the epoch of the maximum of sun-spots. Bigourdan explored the neighborhood of the sun for intra-Mercurial planets with negative result.

The eclipse of August 9, 1896, was visible in its total phase in Norway, Nova Zembla, and northern Asia. Notwithstanding the unfavorable character of the weather, excellent photographs were secured by Baden-Powell and by several Russian astronomers. The report of Hanksy on the fine photographic results led him to a clear exposition of the relations of the forms of the corona to the sun-spot period, which has won marked attention and approval. His general prediction of the form of the corona of the eclipse of 1900, as made in his memoir, has been verified. Belopolsky adds another dynamical conception of the corona, in that he infers that, by the general eruption at the sun-spot maximum, matter is ejected into the surrounding corona and thus communicates its higher speed of rotation to the outer corona so that gradually the polar regions are laid bare and by the time the minimum sun-spot period arrives the coronal figure has broadened out into vast equatorial extensions. Both Russian and British photographs show some of the prominences with dark borderings or outlines, and in the former these veins suggest the dark interstices of a series of hoods above the prominences. Shackleton, with signal success, photographed the spectrum of the *reversing layer*, and demonstrated the coincidence of many of the lines with the Fraunhofer spectrum. It was thus for the first time that Professor Young's observation was photographically confirmed.

The path of the total eclipse of January 22, 1898, lay across east central Africa, India, and the Chinese empire. The eclipse was successfully observed by many astronomers and furnished a great wealth and variety of photographic material. Campbell, of the Lick Observatory, in the Crocker eclipse expedition to Jeur, India, employed an objective-grating spectrograph which was so arranged as to give a continuous photographic account of the changes in the solar

ECLIPSE

spectrum at second and third contacts. Many interesting results of differences of level and of intensity of radiation in the lines were obtained. An exposure for the coronal ring at $\lambda 5303$ gave it in a very remarkable form which shows its principal masses to lie in the sun-spot zones. Professor Campbell also found that the source of the continuous spectrum of the corona had the same form as the monochromatic ring just mentioned. It is from the results of this eclipse that Campbell, and later Evershed, deduced the wave-length 5303 for coronium, now universally accepted. The British results obtained with the large prismatic cameras permitted Lockyer to give the wave-lengths of 45 coronal rings arranged in three groups defined by the position angle in which they have their greatest brightness. The different forms of the coronal rings seemingly indicate that they are due to at least three substances whose typical wave-lengths are at 5303, 3987 and 4359. A table of wave-lengths of more than 900 lines in the spectrum of the chromosphere resulted from the photographic spectra. With a small prismatic camera Evershed obtained highly valuable results. His spectra gave measured values of 29 of the hydrogen lines closely agreeing with the values computed by Balmer's formula. A remarkable band of continuous spectrum shown by the prominences and lower chromosphere and beginning in the ultra-violet end of the Balmer hydrogen series (see SPECTROSCOPY), he attributes also to hydrogen. In the flash spectrum the position of almost all the bright lines appears to coincide with dark lines in the solar spectrum, but the relative intensities of the lines in the two spectra are widely different. The dissimilarity in the relative intensities of lines of different elements in the two spectra is attributed to the unequal heights to which the gases of the various elements ascend in the chromosphere, and Mr. Evershed hence concludes, that "the wide divergence between the flash and Fraunhofer spectra with respect to intensities, would appear, therefore, to afford no ground for abandoning the original interpretation of the flash proposed by Young from his observation in 1870, and the evidence of these photographs certainly indicates that the flash does in fact represent the upper, more diffused portion of a true reversing stratum." Professor Campbell's four photographs of the corona made with the 40-foot telescope show a great wealth of detail. One of two seconds' exposure, clearly indicates the ultimate relation of the prominences with the synclinal structure of the corona; another, of eight seconds, gives a fine representation of the polar rays and rifts with a coronal form already clearly influenced by the approaching sun-spot minimum. Professor Burckhalter, using a special appliance for regulating the relative exposure given to the inner and outer portions of the corona, obtained a good representation of its entirety, which, however, still showed over-exposure for the inner details. A fine photographic representation of the four principal streamers of the corona was obtained by Mrs. Maunder, which showed them to distances from the moon's centre of three, four, four and a half, and six diameters respectively.

The total solar eclipse of May 28, 1900, will always be famous for its long course through

civilized territory, its path crossing the United States from Texas diagonally to Virginia, and finally threading its way across Spain. It is chiefly memorable for the fine weather which prevailed along the track of totality, and for the magnificent array of optical and physical appliances employed in its observation. The chief American parties were those of the Lick, Yerkes, Allegheny, Smithsonian, Princeton, Brown, Harvard, and United States Naval observatories, conducted respectively under the direction of Campbell, Hale, Wadsworth, Langley, Young, Upton, W. H. Pickering, and S. J. Brown. Long focus telescopes either directly pointed at the sun or fed by cœlostats for coronal photography, huge Rowland grating spectrographs for photographing the flash, and the delicate bolometric appliances of Hale and of Abbot characterized the instrumental attack. The large photographs of the corona by Campbell with telescope of 40 feet focus, directly pointed, by Barnard with lens of 61.5 feet focus, and by Smillie with lens of 135 feet focus, gave a fine representation of the inner corona and prominences. The great prominence in the southwest quadrant was a mass of filaments. Its white summit in eruptive activity was visually observed by the writer. Striking changes in this prominence and in others are seen on comparing the American photographs with those of Christie, the astronomer royal, taken at Ovar, Portugal, and of Lockyer, taken at Santa Pola, Spain, about two hours later. The study of the form of the corona as presented by the photographs was of special interest since Professor Bigelow's precise forecast seemed in the main to be verified when compared with Jewell's fine drawing reproducing the corona from photographs. Already in 1891 Bigelow had computed the direction of the coronal streamers for the corona of 1878 and for the two coronas of 1889 on a "polarization theory" in which the coronal lines were shown to lie in the direction of the lines of force surrounding a spherical magnet. Such magnetization of the sun, although suggested, was then not necessarily assumed. The progress of physical science later made it probable that matter on the solar surface was electrically ionized after the manner of the cathode streams of the Geissler tubes. And these electrified particles, or electrons, required then only to be directed by a supposed magnetic field of the sun. Bigelow's "Magnetic Theory of the Corona," supported by Eberts' experiments, seems likely both from the natural assumptions made, and from the deductions allowable, to furnish the master-key to the mysteriously definite arrangement of the corona at the sun's minimum of activity, so characteristic of the eclipses of 1900 and 1901. The modifications yet necessary to account for all the probable solar phenomena as pointed out by Bigelow, Schaeberle, Scheiner, Ebert, Perrine, Abbot, Arrhenius, Dr. Lockyer, and others cannot be foreseen, but it seems likely that we are rapidly approaching conceptions which will correlate not only all coronal, but all solar phenomena satisfactorily. Professor Burckhalter, by means of his method of regulating the relative exposure of inner and outer parts of the corona, attained remarkable success in photographically depicting the details of the entire corona.

ECLIPSE

The spectroscopic observations were manifold and in the main successful. Professor Frost, of the Yerkes Observatory, operating with a prismatic camera of very high dispersion, and two grating spectrographs, photographed and measured some 800 lines. He regards spectra of the cusps taken within 30 seconds of the contacts, and as produced by the powerful instruments he employed, as valuable as those taken at the precise instant of contact. A red sensitive plate was exposed to the coronal spectrum by Professor Frost, and registered rings at $\lambda\lambda$ 4230, 4341, and 4358. Professor Lord, employing a prismatic camera, obtained excellent photographs of the flash, which enabled him to determine the accurate wave-lengths of several hundred chromospheric lines. Professor Wadsworth's photography of the flash spectrum by means of a concave grating objective spectroscope of special type induced his thorough investigation of the optical theory of such appliances which ranks among the very choicest results of the memorable eclipse of 1900. Indeed, Wadsworth's masterful discussions are inseparable from the proper estimate of results of previous observers and furnish a trustworthy guide for future spectroscopic work, of a high degree of accuracy, in eclipses. Sir Norman Lockyer, observing in Spain, determined the wave-lengths of many prominence lines and the heights of the various chromospheric vapors. His comparison of the green coronal ring with the inner and outer corona showed that there is no apparent connection between the points of greatest brightness of the coronal rings and the positions of the prominences, and that the brightest parts of the green coronal ring correspond intimately with the brightest parts of the inner corona, but are not in apparent relation with the outer corona. Professor Evershed, observing in Algiers, just outside of the path of totality, obtained photographs of the flash spectrum in high solar latitudes, and concludes that, in its main features, it is the same as in low latitudes. He verifies the essential identity of the flash spectra as photographed by Shackleton in 1896 and those obtained in 1898 and 1900, and infers that "the flash spectrum is probably as constant a feature of the solar surface as is the Fraunhofer spectrum." In discussing the detailed spectroscopic results of the flash layer, Evershed infers that the abnormal intensities of the enhanced lines characteristic of all levels and all latitudes of the flash is due to a continuous circulation of the solar gases in a radial direction, while the cooler, more diffused gases, in their subsidence, determine the character of the absorption spectrum. His final conclusion is "that the flash spectrum represents the emission of both ascending and descending gases, while the Fraunhofer spectrum represents the absorption of the descending gases only." Professor Deslandres, by means of spectrographs with optical parts of Iceland spar and quartz, photographed the entire ultra-violet spectrum of the reversing layer from λ 4000 to λ 3000, the entire ultra-violet spectrum of the upper chromosphere, and the entire spectrum of the corona with two new coronal rings. Deslandres, observing visually with a powerful grating, inferred from the inclination of the green coronal line on the east side of the equator that the corona appeared to have a more

rapid rotation than the disk. He remarked the feebleness of the green line characteristic of minimum solar activity. Professor Dyson, of the Portugal expedition of Christie, the astronomer royal, with spectroscope of quartz lenses and prisms, obtained a fine series of spectra of the sun's limb near the beginning of totality, and spectra of the corona. Professor Turner secured photographs, in polarized light, of the corona, permitting of a quantitative investigation. The polarization of the corona was radial and was "not only shown in the outer streamers, but right up to the moon's limb." An important bolometric measure of the heat of the corona was conducted by Abbot and Mendenhall, of the Smithsonian Observatory, which led to the conclusion that the corona neither reflects much solar light nor in the main gives light of its own on account of high temperature, "but seems rather to be giving light in a manner not associated with a high temperature, or at least with the preponderance of infra-red rays usual in the spectra of hot bodies." This result plainly points to the electrical character of the coronal light and is also in harmony with Bigelow's magnetic theory. Deslandres, using "a very sensitive Melloni pile" for detecting the heat of the corona, reports positive indications which are in strange contradiction with Abbot's results and intensify the regret at the accident which befell Hale's bolometric appliances at the critical moment. The heat measures in future eclipses will have an exciting interest in relation to coronal theory. The shadow bands were perhaps more systematically observed at this eclipse than at any other. The United States Weather Bureau carried out an extensive system of observation from which Professor Bigelow drew the conclusion that "the shadows were crescent-shaped and had a flickering motion, as if struggling through two or more conflicting movements in the atmosphere itself." Professor Elihu Thomson, observing at Barnesville, saw the bands "curved and broken, not complete lines," and immediately after totality, two sets of bands moving in opposite directions "as if due to opposing air currents at different altitudes." As a further confirmation that the bands are due to different air currents, the larger bands were seen to move in the direction of the wind. The different sets of shadow bands are probably produced by the shifting refraction due to the waves of warm and cool air at the different altitudes.

The total eclipse of May 18, 1901, traced its path across southern Madagascar, the Indian Ocean, Sumatra, Borneo, the Celebes and New Guinea, and, on account of its long duration of over six minutes and the high altitude of the sun at the best points of observation, attracted expeditions from the Netherlands, the United States, Great Britain, France, Russia, and Japan. The general weather conditions unfortunately proved to be unfavorable. At a few of the eclipse stations, however, observations of great value were made. Professor Perrine, observing at Padang, Sumatra, through a partly clear sky, obtained excellent results. His photographs showed "conspicuous series of coronal hoods," and also "a remarkable coronal disturbance resembling an inverted cone of considerable angle" and unlike anything previously recorded. This disturbance associated with a long thread-like

ECLIPSE

prominence, Professor Perrine, subsequently, by means of the Greenwich solar negatives taken at Dehra Dûn, India, traced to a sun-spot and associated faculæ, near the solar limb on the day of the eclipse, and thus plainly exhibited faculæ, prominences, coronal disturbance, and sun-spots in a common origin and intimate relation. This wonderful phenomenon was without doubt due to a solar eruption which took place near the solar limb and at, or just prior to, the time of the eclipse. The spectrographs specially designed and prepared for photographing the delicate Fraunhofer lines of the corona by Professors Campbell and Wright proved very efficient in the hands of Perrine and gave a band of continuous spectrum for the inner corona, 35 Fraunhofer lines between H β and H for the outer corona, and bright H and K lines extending entirely across the moon's disk, as well as 40' east of the sun's limb. The latter indicates clearly that prominence radiation is diffused in the earth's atmosphere. The photographs of Mr. Peters, of the United States Naval Observatory, taken at Fort de Kock, Sumatra, confirm Perrine's results as to the formation of hoods or envelopes above some of the prominences, and are replete with structural detail. The corona, according to Perrine's photographic negatives, was polarized in the portions 10' beyond the solar limb in all position angles including the polar regions. In negatives of the English astronomer, Newall, some of the streamers showed greater extension in the polarized than in the unpolarized light.

The spectroscopic results of this eclipse were not unimportant. Dr. Humphreys used a concave grating of 30 feet focal length without slit or lens and was able to present accurate wavelengths of nearly 400 lines in the chromosphere, assign their intensity and character, and identify the substance in most cases. Hydrogen, helium, and the H and K light, generally attributed to calcium, but by Trowbridge to oxygen, gave arcs showing a height 34", or greater than the solar diameter. Humphreys' investigations point to "a very extensive distribution of the elements in the chromosphere with no narrow separating boundaries producing distinct layers of any kind," and show that "in general the heavier and, only the heavier, Fraunhofer lines appear as bright lines in the flash, and that the relative intensities in the two cases are roughly comparable." Dr. S. A. Mitchell, using a Rowland flat grating of 15,000 lines per inch and a quartz lens, secured measures on some 480 bright lines for the flash at third contact. The theory of Sir Norman Lockyer that lines stronger in the spark than in the arc spectrum, known as "enhanced" lines, are found in the spectrum of the chromosphere, has been critically examined by Dr. Mitchell, by means of the spectroscopic data furnished by his photographs, and he concludes, "From these comparisons it would seem that there is no close connection between 'enhanced' lines and the bright lines of the chromosphere seen in the flash." In the special work on the corona contemplated by Professor Barnard's long exposure of a very large plate, and by Dr. Abbot's second attempt to measure the coronal heat bolometrically, there was universal interest among astronomers and universal regret at the compulsory postponement to a future eclipse on account of the clouds. A

photographic search for an intra-Mercurial planet was conducted by Perrine using four lenses covering a stretch of 10° on either side of the solar equator. The faintest stars on the plates range from 6.5 to 9.3 visual magnitude, and Perrine infers that "unless at the time of the eclipse the planetary bodies were directly in line with the sun or with the brightest portion of the corona, there is no planetary body as bright as 5.0 visual magnitude within 18° of the sun, whose orbit is not inclined more than 7¼° to the plane of the sun's equator."

Bibliography.—The general theory of eclipses and the methods for their computation have been developed by Bessel in the 'Astronomische Nachrichten,' Nos. 151 and 152, but with the utmost rigor in his 'Astronomische Untersuchungen,' Vol. II.; and by Hansen in 'Astronomische Nachrichten,' Nos. 339–342, and in complete treatment in 'Abhandlungen der math., phys. Classe der Königlich Sächsischen Gesellschaft der Wissenschaften,' Vol. IV. The most reliable general tables for the computation of eclipses are those of Newcomb, 'Astronomical Papers of the American Ephemeris,' Vol. I. Oppolzer's 'Syzygientafeln für den Mond' (Publication der Astronomischen Gesellschaft, XVI.), and his 'Tafeln zur Berechnung der Mondesfinsternisse' (Denkschriften der K. Akademie der Wissenschaften zu Wien, Vol. XLVII.), are based on Hansen's 'Lunar Tables' and are employed in the production of that rich storehouse of eclipse knowledge: Oppolzer, 'Canon der Finsternisse,' published as Vol. LII. of the 'Denkschriften' of the Vienna Academy. It contains the elements of 8,000 solar and 5,200 lunar eclipses occurring between the dates —1207 Nov. 10 (Julian) and 2161 Nov. 17 (Gregorian), and the accompanying charts show the approximate path of each eclipse on the earth's surface. A valuable accessory to Oppolzer's 'Canon' is found in Dr. R. Schram's 'Tafeln zur Berechnung der näheren Umstände der Sonnenfinsternisse,' published in Vol. LI. of the Vienna 'Denkschriften.' Dr. Eduard Mahler, in Vol. XLIX. of the Vienna 'Denkschriften' has published valuable elements and tables entitled 'Die Centralen Sonnenfinsternisse des XX. Jahrhunderts.' Ginzel, in the 'Sitzungsberichte' of the Vienna Academy, LXXXV., LXXXVII., and LXXXIX., and in his 'Spezieller Canon der Finsternisse,' published by the Berlin Academy, has brought together a large array of references to ancient eclipses, and compared them with computation. The papers of Airy, Williams, Maguire, and S. J. Johnson in the 'Monthly Notices' of the Royal Astronomical Society are of interest. The physical data and problems of total solar eclipses are treated in a vast modern literature mostly issued by the observatories and learned societies. A highly important compend of physical information concerning total solar eclipses is that of Ranyard, 'Memoirs of the Royal Astronomical Society,' Vol. XLI. For the later eclipses the most valuable discussions are to be found in the publications of the United States Naval, Harvard, Lick, Yerkes, and Smithsonian observatories, in the 'Astronomische Nachrichten,' the 'Memoirs,' and the 'Monthly Notices' of the Royal Astronomical Society, and in the 'Astrophysical Journal.'

MONROE B. SNYDER.

Director of the Philadelphia Observatory.

Ecliptic, in astronomy, the sun's path, the great circle of the celestial sphere, in which the sun appears to describe his annual course from west to east. The Greeks observed that eclipses of the sun and moon took place near this circle; whence they called it the *ecliptic*. The sun does not always rise to the same height in the meridian, but seems to revolve round the earth in a spiral, and is in the equator twice a year, about 22 March and 22 September. The points of the equator in which the sun is on these days are at the intersection of the equator with the ecliptic. On 21 June the sun reaches its greatest height in the heavens, and 21 December it descends the lowest. The ecliptic has two poles, 90 degrees from it, which appear to revolve about the north and south celestial poles, respectively, every 24 hours. What appears to be the path of the sun, however, is in reality the path of the earth. The planets and the moon revolve in different planes; but these are inclined at only a very small angle to the plane of the ecliptic; hence these bodies can be but a small distance from the ecliptic. The plane of the ecliptic is very important in theoretical astronomy, because the courses of all the other planets are projected upon it and reckoned by it. By the obliquity of the ecliptic we understand its inclination to the equator, or the angles formed by the planes of these two great circles. This angle is measured by the arc of a third great circle, drawn so as to intersect the two others perpendicularly, in the points at which they are farthest apart. The ancients endeavored to measure the obliquity of the ecliptic. According to Pliny, it was first determined by Anaximander; according to Gassendi, it had been ascertained by Thales. The most celebrated measurement of this obliquity in ancient times was made by Pytheas, at Marseilles. He found it, 350 B.C., to be $23^{\circ} 49' 23''$. A hundred years later, according to Ptolemy, Eratosthenes found it to be $23^{\circ} 51' 13''$. In 1900 the obliquity was $23^{\circ} 27' 8''$; it is diminishing at the rate of nearly half a second a year, and is expected to reach a minimum value of $22^{\circ} 15'$ in about 15,000 years. See DAY; NUTATION.

Eclogite, ĕk'lō-jīt, or **Eklogite**, a crystalline rock composed of the grass-green amphibole called smaragdite, and red garnet. Another variety of eclogite is composed of omphacite, a grass-green granular variety of pyroxene, and garnet. Eclogite is not an abundant rock; it is usually associated with the older crystalline schists, but as a rule is not itself schistose. It is found in Norway, Greece and in parts of the German empire.

Eclogue, ĕk'lōg, in poetry, the name is given to poems of the same form; thus the satires of Horace were called eclogues. Since Virgil's *Bucolics* received this name (from grammarians probably, and not from the poet), the term eclogues has usually been applied to what Theocritus called *idyls*—short, highly finished poems, principally of a pastoral nature. See IDYL.

Ecole des Beaux Arts, ā-kōl dā bō-zār, (School of Fine Arts), the French government school in Paris, founded by Mazarin in 1648, and provided with an extensive staff of teachers. The competitions for the *grands prix de*

Rome take place at this school. All artists between the ages of 15 and 25, whether pupils of this school or not, may compete, after passing two preliminary examinations. The successful competitors receive an annual allowance from the state for three or four years, two of which must be passed at Rome.

Ecology. See BIONOMICS; PLANT GEOGRAPHY.

Economic Association, American, organized 1885 for the encouragement of economic research, the publication of economic monographs and the encouragement of perfect freedom of economic discussion.

Economic Development of the United States. See UNITED STATES—ECONOMIC DEVELOPMENT OF THE.

Economic Entomology. See ENTOMOLOGY, ECONOMIC.

Economics. See POLITICAL ECONOMY.

Economists, a name given to certain French writers of the 18th century, who maintained that agriculture is the only fountain of wealth, and therefore clamored for a land tax. Persons versed in the science of political economy, as Malthus, an English economist. Also applied to officers in some cathedrals in the Church of Ireland, who are appointed to manage the cathedral fund, to make payments, etc.

Economy, Pa., village in Beaver County, on the Ohio River, and Pittsburg, Ft. W. & C. R.R.; 20 miles northwest of Pittsburg. The first settlements were made by a colony of "Harmonists" who had formerly lived in Pennsylvania, then moved to Indiana, but returned and founded Economy in 1825. Pop. 1,062. See HARMONISTS.

Ecrevisse, ā-krēv-ēs, **Peter**, a Flemish novelist: b. Obbicht, Limburg, 1804; d. 1879. In 1860 he withdrew from a promising political career and devoted himself to literature. He is noted for his power of description and his simple earnest style. Among his numerous historical novels may be mentioned: 'The Destruction of Maestricht'; 'The De Witt Brothers.' He was author also of some novels of society: 'The Cancer of Cities'; 'The Stepson'; 'The Servingman of Kempen.'

Ecrévisse. See CRAYFISH.

Ec'stasy, a state of consciousness, in which the natural powers or faculties are transcended by absorption in a fixed object or idea beyond normal cognition. In its theological aspect the term ecstasy is generally used as equivalent to rapture. Distinction should be made between true religious ecstasy and its simulations. Saint Thomas Aquinas, the great theologian of the Middle Ages, says that it may arise from three causes; first, bodily, as when a person is alienated from his senses by disease; secondly, it may be preternatural, as when it is wrought by the agency of devils; and lastly, and this is the case of true religious ecstasy, when it comes from the Spirit of God. Many instances of this latter are recorded in the Old and the New Testaments, and we also have accounts of this supernatural phenomenon in the lives of the Saints. Mystical writers describe this state as the complete suspension of the senses, the body being, as it were, dead, while the will, as Saint Teresa points out, retains its full power and is completely absorbed in God. Ec-

ECTHYMA—ECUADOR

stasy arising from disease is described in the terms of modern science as a "condition of the nervous system and mind characterized by immobility, suspension of normal sensory and motor functions, and rapt concentration upon a limited group of ideas." There is little question but that ecstasy of this latter kind is a manifestation of the hysterical temperament. It is closely allied to hypnotism, catalepsy, trance, etc. Consult Maudsley, 'Pathology of Mind'; Tuke, 'Dictionary of Psychology'; Janet, 'Mental State of Hystericals'; Baldwin, 'Dictionary of Philosophy and Psychology' (1901); Mantegazza, 'Estasi Umane' (1887); James, 'Varieties of Religious Experience' (1902).

Ecthyma, ĕk-thĭ'ma, a complication of a number of general disorders manifesting itself as a form of pustular inflammation of the skin, particularly distributed on the extremities, the lower especially, the neck and trunk also often being affected. As a rule the affection begins as a small pimple which takes a rounded outline unless scratched. This pimple develops into an ulcer which is covered over with a thick dark crust. The ulcer heals slowly and there is a small scar resulting. The development of the disease is slow, usually running a fortnight, and the pimple may be single or appear in crops. There is burning and pain. The common cause of ecthyma is diminished bodily resistance, such as is found in starvation or in syphilis, tuberculosis, diabetes or anæmia. The common organisms causing the actual pustulation are streptococcus and staphylococcus. The initial injury is often brought about by scratching due to the bites of some house-pests, or the itching of diabetes, or senile itching, or some form of local skin irritation. Soap and water, good food, and antiseptic dressings, such as hydrogen peroxide, nitrate of silver, and sulphur ointment, are usually sufficient, with proper general hygiene, to bring about a cure.

Ec'toderm. See EMBRYOLOGY.

Ecto'zo'a, animals parasitic on the outside of living bodies, as distinguished from *Entozoa*, animals parasitic within them. Both terms are general and have no taxonomic significance.

Ectro'pion, or **Ectropium**, a Greek term meaning an everted eyelid, a turning outward; an abnormal eversion of the eyelids.

Ecuador (properly, *La Republica del Ecuador*): The Republic of the Equator), a country of South America. According to the claims of its own government, it is bounded on the east by Brazil, extending from the Pacific Ocean, at lon. 82° 55' W., to lon. 72° 12' W., and from lat. 1° 50' N. to lat. 5° 30' S., but nearly all of the region east of the Andes is claimed by Peru, and the boundary with Colombia is also in dispute (see COLOMBIA). Therefore, it is bounded on the north and northeast by Colombia, and on the southeast and south by Peru, according to the adverse views entertained by those competing governments. The area in its actual possession is about 120,000 square miles; the total area, if we include disputed territory and the archipelago of Galápagos, is nearly 276,000 square miles.

Political Divisions.—The country is divided into 16 provinces (counting as one the undefined eastern region), as follows: (1) Province of Pichincha, including the *cantones* of Quito, Cay-

ambe, and Mejia. Its chief town, also capital of the republic, is Quito, with 80,000 inhabitants: seat of the central government, the archbishopric, the university, the supreme and superior courts, etc. (see below, *Judiciary*), headquarters of army corps, general commanding district, and superintendent of police. Quito's principal buildings and institutions are: The palaces of the president, of the archbishop, of the government, of the School of Arts and Trades, and of justice; city hall, university, three seminaries, astronomical observatory, Institute of Sciences, Medical School, two chemical laboratories, two museums of natural history, two botanical gardens, 33 churches with convents, six additional convents, four colleges, three schools for young women (116 schools in the canton), five public libraries, six asylums, two houses of refuge, two houses of correction, five cemeteries, four barracks and an arsenal, two public promenades, five squares with statues, the Sucre Theatre (which holds 2,000 spectators), and two banks. There are 16 journals. Industries of the province are: cattle- and sheep-raising, manufacture of cloth, candles, cheese, chocolate, etc. There are 22 mills. The embroideries and laces made by the women of Quito are famous. The city, built on the flank of the mountain which gives its name to the province, has beautiful suburbs; thanks to its elevation above sea-level (9,250 feet), the climate is temperate. The Alameda is a fine park, planted with oaks, eucalyptus, and other large trees. (2) The province of Carchi: principal town Tulcan (5,000 inhabitants), residence of the governor, police commissioner, commander of the military force of province, and municipal authorities. Industries are: cattle-raising and the cultivation of cereals in the higher and middle (temperate) regions. The products of the lowlands are sub-tropical—sugarcane, etc. (3) The province of Imbabura. Its chief town, Ibarra, which was destroyed by the earthquake of 1808, has now 5,000 inhabitants. It is the residence of a bishop, in addition to the civil and military authorities located in every province—those mentioned under Carchi. Principal buildings are the palace of the government, Roman Catholic schools, churches, and convents. Products of the region are cereals, sugarcane, cotton, and cattle. (4) Province of Léon: its principal town, Latacunga, has 12,000 inhabitants. Products are as given in 2 and 3; there are also potteries. The highest active volcano in the world, Cotopaxi (19,614 feet) is in this province. (5) Province of Tungurahua: the principal town, Ambato, has a population of 8,000. Special products of the region are wine, porcelain, and hats. It includes the Tungurahua volcano. (6) Province of Chimborazo, with five *cantones*. The principal town, Riobamba, which was destroyed by an earthquake in 1799, has 12,000 inhabitants. A leading product is cinchona, or Peruvian bark. The mountain which gives its name to this province is often called "the king of the Andes," though it is not equal to the highest peaks in Bolivia. (7) Province of Bolívar, a salt-producing region; chief town Guaranda (6,000). (8) Province of Cañar, with gold-mining as one of its industries; principal town Azogues (4,000). Ruins of a palace dating from the period of Inca supremacy are found in this province. (9) Province of Azuay: its principal city, Cuenca (q.v.), with 30,000 inhabitants, is a centre of literary

ECUADOR

and artistic life in the republic. (10) Province of Loja: its principal town, also called Loja, has 10,000 inhabitants. This province adjoins Peru, and its boundary with that country is disputed. It contains the ruins of the palace of Villamarca. (11) Province of El Oro, which has gold mines at Zaruma, and produces cacao and coffee on the lands along the Pacific coast. There are also fisheries. Chief town Machala, with 3,200 inhabitants. (12) Province of El Guayas, of which Guayaquil (pop. 60,000) is the commercial metropolis. The local authorities are: the governor, bishop, municipal council, general commanding the troops of the district, chief of police, justices of the superior court and judge of commerce, the consular corps, and the superintendent of the custom-house. Noteworthy buildings or institutions are: the city hall, palaces of the governor, bishop, and commanding general, cathedral, seminary, nine churches, several chapels, municipal library, civil and military hospitals, schools of medicine and law, university, chemical laboratory, national college, a ladies' philanthropic society, a school of arts and crafts, Convent of the Sacred Heart School for Young Women, orphan asylum, Olmedo Theatre, circus, etc. There is a statue of the poet Olmedo in the avenue which bears his name, and an equestrian statue of Bolívar in Seminario Park. A dozen newspapers are published in the city. Products of the region are: cacao, coffee, sugarcane, cereals, cotton, rubber, vegetable ivory or corozo, construction and cabinet woods, articles manufactured with sugar, tropical fruits, cattle, horses and mules, tobacco, beer, artificial ice, and mineral waters, chocolate, liquors, alcohol, soap, candles, hats, hammocks, and several varieties of fish. There are two banks of issue and a savings bank, four clubs and German and Spanish casinos. Guayaquil was partly destroyed by fire in 1896, but has been rebuilt. It has improved in appearance, and perhaps also in the matter of sanitation; yet it has not a good reputation for healthfulness. The climate is very hot. The city is lighted by gas, and has potable water, the source of supply being in the cordillera. (13) Province of Los Rios: its chief town, Babahoyo, has 3,000 inhabitants. (14) Province of Manabí; principal towns Portoviejo (5,000) and Jipijapa (6,000). The finest of the so-called "Panama" hats are made exclusively in Ecuador, especially in Jipijapa. Other products of this region are sarsaparilla, vanilla, and pearls from a small island. (15) Province of Esmeraldas, where tobacco is grown that is comparable with the Cuban product. Population of the chief town, also called Esmeraldas, about 6,000. (16) The vast, insufficiently explored Oriental province, with settlements at Napo, Archidona, Tena, and Canelos, and Indian tribes, the Jíbaros, etc. A governor and chief of police represent the authority of the republic. Chapels have been built, and missions established. The soil is supposed to be uncommonly fertile, and it is watered by large rivers. (17) Galápagos Archipelago (q.v.), now called the Archipelago of Colón by some Ecuadorian writers who wish to create the impression that it is an attractive field for immigration. It was formerly a penal settlement, and was especially used as a place of banishment for political offenders. The population of Chatham Island was said to be about 2,000 in 1900; the other islands are nearly uninhabited. The authorities

are the territorial governor, a priest, and a military commander. Products: the giant tortoises (Spanish, *galápagos*), whalebone, etc.

Topography and Physical Geography.—The cordilleras of the Andes traverse Ecuador, running nearly north and south, with elevated plains between the eastern and western mountains—some of the latter forming a sequence that has suggested to geographers two parallel chains; and it is, indeed, true that the eastern and western limits of the broad band of Ecuadorian upland roughly parallel each other. (See *CORDILLERAS*.) There are four facts of special interest: First, Though we do not find here the highest single peaks in the world, or even in South America, there are nowhere else so many peaks of very great height, forming a group. Second, their equatorial situation gives to these masses of granite, gneiss, schist, trachyte, porphyry, and volcanic detritus wholly exceptional contrasts in temperature (see below, *Climate*). Third, this region has been in the past, and is probably today, more subject to volcanic disturbances than any other in South America. Fourth, as an offset to the group of high peaks, the Andean ridges sink downward, forming the lowest pass that exists at any point between Colombia and the southern end of the continent. The principal rivers of the lowlands of western Ecuador, running from the central region of mountains and high plains to the Pacific, are the Guayas and the Esmeralda. The former empties into the Gulf of Guayaquil, one of the best harbors on the western coast of South America. In the eastern lowlands, the Napo and its tributaries belong to the Amazon River-system.

Mineral Resources.—Salt, mineral pitch, and gold are produced. The Zaruma mines, province of El Oro, were reported as being worked on an extensive scale in 1903. That district contains numerous gold-bearing quartz veins, which were worked by the Spaniards 100 years ago.

Climate.—The mean temperature of the coast at Guayaquil, etc., is 28° C.; that of the interior ranges from 35° C. in the lower valleys to 18° or even 10° C. on the plateaus, according to the altitude. The lower slopes of the mountains are torrid; the highest crests are snow-clad. The climate of the capital is temperate and spring-like throughout the year, with little variation, and it is said to be one of the best in the world for the cure of tuberculosis. (See also *CUENCA*.) There are two seasons only, the rainy and the dry.

Agriculture.—The cultivated area is limited, owing to the lack of laborers; nevertheless Ecuador produces more cacao than any other country, and not a little coffee. These products, with sugarcane and tobacco, are found in the lowlands of the coast and Amazon basin; cereals and vineyards in the elevated valleys. (See also *Political Divisions* for products of the different provinces.)

Exports and Imports.—In 1901 the total value of exports was 16,392,333 *sucre*s, and the total value of imports for the year 15,126,281 *sucre*s (value of *sucre*, \$0.487). On the import list of the country the United States ranks first, Great Britain second, and Germany third. Imports from the United States in the fiscal year 1901 were valued at \$2,015,085; exports to the United States \$1,424,840. Shipments of cacao from Ecuador in 1901 amounted to 23,179,095 kilograms, showing a marked increase over those

ECUADOR.

2. A Pass in the Andes; Guayaquil and Quito Railway.

ECUADOR

of 1900. Ecuador exported in 1900 through the port of Guayaquil 1,733 tons of coffee, with a value of \$121,500. Imports are: cloth (cotton, woolen, silk), foodstuffs, boots and shoes, oils, alcohol, wines and liquors, beer, mineral waters, preserved and fresh fruits, and live-stock.

Railways, etc.—Sixty miles of the railway from Guayaquil to Quito were built before 1880, that is, from the coast to the village of Chimbo, at the base of the cordillera. There the enterprise was checked by the difficulties of construction. A company organized in the United States undertook to complete the road, and by 1903 had succeeded in laying rails from Chimbo to Guamote, on the plateau, a distance of 58 miles. There are 1,221 miles of telegraph, with 50 offices. The Ecuadorian landing-station of the Central and South American Telegraph Company's cable is at Salinas, which was declared open as a minor port by executive decree 21 Aug. 1902. Quito and Guayaquil have telephone services; the latter a street-car system. The mails are carried twice a week to all parts of the republic; to foreign countries once a week. Twenty passenger steamers ply on the Guayas River, and between Guayaquil and the other coast towns. English steamships of the Pacific line, and vessels of the Chilean line plying between Valparaiso and Panamá call regularly at Guayaquil.

Banks.—(At Guayaquil and Quito: see *Political Divisions*.)

Government.—Congress meets at Quito every two years, usually on 10 Aug., for 60 days. There are two chambers: the senate (two senators from each province; term, four years) and the chamber of deputies (one deputy for each 30,000 inhabitants; term, two years). Both senators and deputies are elected by direct popular vote. Eleven constitutions have been promulgated since 1830; that of 12 Jan. 1897 is now in force. The president and vice-president of the republic are elected for four years by direct vote of the people; they cannot be re-elected until eight years have passed after expiration of their terms of office. The president cannot go out of the country, either during the continuance of his functions or for a year after they have ceased. There were formerly five ministries, but the number has been reduced to four, namely, those of the interior, police, and public works; foreign relations, public instruction, justice, and worship; finance; and war and navy. The council of state is a body composed of the vice-president of the republic, the ministers, two officials of the law courts, the rector of the university, two senators, two deputies, and two citizens not holding other office. Governors of provinces are agents of the executive, appointed by the president; agents of the governors are the "political chiefs"; and agents of the latter are "political lieutenants," one for each parish, who have the rural authorities under their charge.

Finances.—The budget for 1902 showed the following sources of revenue for the government: customs 9,640,700 *sucre*s (the chief items being, duties on imports with surtax 6,400,000, and duties on exports with surtax 1,800,000 *sucre*s); receipts from industries controlled by the government, that is, salt and powder, 450,000 *sucre*s; sundry taxes 2,868,804.25; public lands, etc., 423,000 *sucre*s; and leases 36,000 *sucre*s. Disbursements were: congress 111,780 *sucre*s; the president of the republic 43,632 *sucre*s; the

vice-president 9,600 *sucre*s; council of state 1,500 *sucre*s; department of interior, police, and public works 3,603,168 *sucre*s; department of foreign relations, etc., 2,168,034 *sucre*s; department of finance 2,821,694.32; department of war and navy 3,691,502.18; additional public works 1,068,802.80 *sucre*s. Total disbursements 13,319,764.30; surplus 98,739.95 *sucre*s. The foreign debt, chiefly a relic of loans contracted by the old republic of Colombia, at the time of the union of Ecuador, Venezuela, and New Granada, was approximately \$3,355,000 in 1901; the internal debt is much larger. The gold standard has been adopted in accordance with the law of 4 Nov. 1898.

Army and Navy.—In time of peace, the army consists of: infantry, about 3,690 men; artillery, 1,362; cavalry, 468; national guard (on paper), 95,329. The national guard includes companies of firemen—organizations which are especially numerous and influential in Guayaquil. The naval vessels are, one torpedo boat and a transport.

Population.—The boundaries of the republic being in dispute, and a large part of Ecuador's claim being unexplored territory, estimates of the total number of inhabitants vary, naturally. The Ecuadorians usually say about 1,500,000, including uncivilized Indians.

Education.—Primary instruction is gratuitous and obligatory for children between 6 and 12 years of age. Among the subjects taught, beside the familiar elementary branches, are morality and religion, and urbanity. In the boys' schools the constitution of Ecuador is added; in those for girls, sewing and domestic economy. In 1900 there were more than 80,000 pupils in the public schools, as compared with 47,913 in 1885. The number of schools increased from 789 in 1885 to nearly 1,250 in 1903. Secondary instruction is provided in 37 "colleges," with 371 professors and 4,500 students; the school year beginning 10 October and ending 30 July. The university at Quito—with associate universities at Cuenca and Guayaquil, has faculties of philosophy, belles-lettres, law, medicine, physical and natural sciences, mathematics, and agriculture. An officially authorized publication states that "a large number of primary and secondary schools have been confined hitherto [before 1900] to the religious orders, who have acquitted themselves of their task with zeal and success." Schools of arts and crafts are found in the provinces of Pichincha, Léon, Chimborazo, Azuay, Loja, and Guayas. Bahia has a commercial school.

Literature.—José Joaquín de Olmedo (b. Guayaquil 1780) and Juan Montalvo (b. Ambato 1833) are esteemed by loyal Ecuadorians, the former the greatest poet, the latter the greatest prose writer, of South America. Ecuador was also the birthplace of José Mejía, the "American Mirabeau," and of many historians, theologians, poets, romancers, and critics whose works are as highly regarded in Spain as in America. The Ecuadorian Academy (founded 1875) is the chief of the literary associations of the republic. Liberty of the press is guaranteed by the constitution. In painting and music the progress is less noteworthy.

Judiciary.—Ecuador's courts are: the supreme court, at Quito (five justices, attorney-general, two secretaries); superior courts at Quito, Guayaquil, Cuenca, Riobamba, Loja, and

Portoviejo; court of account, at Quito (seven judges); municipal civil tribunals of the first instance at Quito, Guayaquil, and Cuenca; fiscal judges for each province; judges of commerce in large towns; judges of mines, police, and parishes. In criminal cases, trial by jury is provided for, but only in the larger towns.

Local Government.—This is controlled, as we have shown, by the central government. Chief towns of *cantones* have municipal councils, commonly of five members. There are rural (mounted) and urban police, with a director or chief in each provincial capital.

History.—The Quito Indians, who held the country near the present capital, were conquered, perhaps in the 10th century, by a more warlike race led by chiefs called Scyris. These in turn yielded to the Incas of Peru. On the death of Inca Huayna-Capac, the empire was divided between his two sons, Atahualpa and Huascar. The former, whose mother was a Scyri princess, revived the Quito kingdom; Cuzco and the southern empire were given to the latter. War broke out between the brothers shortly before the Spaniards under Francisco Pizarro arrived upon the scene, and this civil strife made possible the conquest of a great nation by a handful of adventurers (see Cuzco and Peru). Benalcazar, the famous Spanish captain, completed the conquest of the Scyri kingdom, and seized the city of Quito (1534). Between 1564 and 1820 this region was administered as a presidency; and 36 presidents exercised authority there as representatives of Spain before the series of "presidents of the republic" began. Quito's first demonstration in favor of independence, 10 Aug. 1809, was quickly and savagely repressed; Guayaquil was more fortunate in her belated attempt (9 Oct. 1820). A campaign which resulted in the capture of Quito, after the battle of Pichincha, was organized by a triumvirate whose members were the poet José Joaquín de Olmedo, mentioned above, the merchant, F. Roca, and the soldier, Rafael Jimena. The battle of Pichincha was won for the patriots by the Venezuelan general, Antonio de Sucre, Bolívar's lieutenant: the territory thus liberated was naturally drawn into the Colombian federation, which Bolívar dominated for a time (see COLOMBIA). In 1830, after the dissolution of that greater Colombia, Ecuador was constituted as an independent republic. The convention of Riobamba placed Gen. Juan José Flores at the head of the government. His successor (1835-9) was Vicente. Flores was again in power from 1839 to 1845, and, with the approval of many partisans, tried to secure a much longer term and dictatorial powers. A second triumvirate, composed of Olmedo, Roca, and Noboa, carried on the government until a convention was held at Cuenca. This convention elected Vicente Ramón Roca, who served as president from 1845 to 1849. Vice-President Acásubi assumed the presidency when congress and the country could not agree upon a candidate; the country, however, continued to be disturbed until 1851, when Diego Noboa was chosen by a constituent assembly. In the following year he was displaced by Gen. José María Urbina, at the head of a successful revolution. Urbina was president until 1856. Slavery was abolished during his term. Gen. Francisco Robles followed (1856-9). During the next two years the country had a varied experience:

war with Peru, the dictatorship of Gen. Franco, and the provisional government of Gabriel García Moreno. The convention of Quito elected García Moreno to the presidency (1861-5). Jerónimo Corrión, elected in 1865, retired in 1867. Javier Espinosa served from 1868 to 1869. García Moreno, as the leader of an insurrection, took office again (1869-73), and in 1873 secured re-election by the use of force. He was assassinated 6 Aug. 1875. Antonio Borrero, his successor, was driven from office by Gen. Ignacio de Veintemilla in 1876. After the expiration of the legal period, President Veintemilla made himself dictator. José María Plácido Caamaño was president from 1884 to 1888; Antonio Flores from 1888 to 1892; Luis Cordero from 1892 to 1895—when he resigned to put an end to bloodshed. Gen. Eloy Alfaro, at first "supreme chief," was legally elected in 1897. Gen. Leonidas Plaza succeeded him in 1901.

Bibliography.—American Republics, International Bureau of the, 'Monthly Bulletin,' Washington, 1902-3; Cevallos, 'Geografía del Ecuador' and 'Resumen de la historia de Ecuador'; Church, 'Ecuador in 1881: Report to United States Government'; Prescott, 'Conquest of Peru'; 'République de l'Equateur et sa participation à l'Exposition Universelle de 1900'; Velasco, 'Historia del Reyno de Quito' (3 vols. Quito 1841-4), and a French translation of that work in H. Ternaux Compans' 'Voyages, Relations, et Mémoires Originaux.'

MARRION WILCOX.

Eczema, čk'zě-ma, an acute or chronic disease of the skin, showing a vast variety of changes in the skin itself, and accompanied by intense itching, burning, or pain. The changes in the skin at first are usually marked by redness, papules, then small vesicles or pustules which later become crusted and dry; or the surface is weeping. Infiltrated and scaly patches are common. All of the different forms of eczema (and no less than a dozen varieties are described by skin specialists) have certain definite changes occurring in the skin. There is usually swelling, congestion, and increase of temperature locally. There is almost invariably an exudation of fluid into the tissues, with the formation of vesicles and pustules, as described. There is further a certain amount of plastic exudation which produces in the skin papulous areas that are thickened and infiltrated. Finally there are the subjective symptoms of itching, which may be only a slight tingling or prickling sensation, or may be so intense as to demand continued and deep scratching, until bleeding or oozing takes place. This itching is, as a rule, intermittent in character, being almost invariably worse at night when the patient is covered, the heat of the body causing the aggravation. Sometimes exposure to cold brings about intense itching. The disease usually runs an acute course, and may be limited to one region of the body, or may be general. Its general tendency is to progress rather than to get well. It is perhaps one of the most obstinate of all skin diseases, and at the same time one of the most difficult to diagnose and to treat. The treatment of each case is a particular study. Sometimes the disease is beyond the power of the best skin specialist. At other times corrections of minute errors in diet will bring about cure. So far as household remedies are

concerned, only those that can relieve the itching are deserving of notice in this place. One of the best of these is carbolic acid in weak solution—two to three per cent. This may be applied on a bit of absorbent gauze. Special care being taken not to enclose a particular part completely with the weak carbolic acid. Bland non-irritating powders such as calamine and oxide of zinc are often useful. When the disease becomes chronic it is apt to be extremely obstinate.

Edam, ē'dām, Holland, town 12 miles north-northeast of Amsterdam, and about a mile from the western shore of the Zuyder-Zee, with which it is connected by a canal. This place is chiefly noted for its trade in cheese, of which nearly 1,000,000 pounds are annually sold in its market. (See CHEESE.) The town was once fortified, and has still a wall with seven gates. Pop. 6,444.

Edar, India, a Rajput state of Guzerat in the Mahi Kantha agency, tributary to the Guicowar of Baroda, and subject to the political superintendence of the presidency of Bombay. It has an area of about 4,966 square miles, and an estimated population of 260,000. Its capital, a picturesque town of the same name, contains 6,300 inhabitants.

Edda, ēd'a (Icel. meaning "grandmother"), a name given by Bishop Brynjulf Sveinsson to a volume containing the system of old Scandinavian mythology, as being the mother or source of all Scandinavian poetry. It was originally compiled by Sæmund, a Christian priest in Iceland, who died 1133, and contained poems and chants of a mythic, prophetic, and religious character. A prose synopsis of these poems was made by Snorri Sturleson, an Icelander (b. 1178), a pupil of the grandson of Sæmund, who was court poet in Norway. He was assassinated in 1241, on his return to Iceland. The portion of the book compiled by Sæmund is known as the 'Elder' or 'Poetic Edda,' and the continuation of Sturleson as the 'Younger' or 'Prose Edda.' Translations of both books are found in English, German and French. See ICELAND.

Eddoes, ēd'ōz, a tropical vegetable. See Cocco.

Eddy, Clarence, American organist: b. Greenfield, Mass., 23 June 1851. He studied with Haupt in Berlin 1871, and between 1877 and 1879 gave a series of organ recitals numbering 100, without repetitions, in Hershey Music Hall, Chicago, in which city he resided for many years. He made successful tours through Europe, and in 1895 removed to Paris. In 1899 he was appointed director of music at the Paris Exposition of 1900.

Eddy, Henry Turner, American educator: b. Stoughton, Mass., 9 June 1844. He was graduated at Yale College in 1867. He was assistant professor of mathematics and civil engineering in Cornell University 1869-73; professor of mathematics, astronomy and civil engineering in the University of Cincinnati 1874-90; president of the Rose Polytechnic Institute, Terre Haute, Ind., 1891-4; in the last-named year accepting the chair of engineering and mechanics in the University of Minnesota. His publica-

tions include: 'Analytical Geometry' (1874); 'Researches in Graphic Statics' (1878); 'Thermodynamics' (1879); 'New Constructions in Graphic Statics' (1880, in German); 'Maximum Stresses Under Concentrated Loads,' etc.

Eddy, Mary Baker Glover: b. Bow, N. H. The world's highest meed of praise is eventually bestowed upon those who have made the largest contribution to its spiritual good, and it is in the light of this fact that the honored place of Mrs. Eddy's name, in the annals of the race, is unqualifiedly assured. The prominence in public thought which she has already attained, as the Discoverer and Founder of Christian Science, and the tender love which glows for her upon the altars of unnumbered hearts, find their explanation in the ministry of good which she has brought to her fellowmen.

Born in the town of Bow, N. H., her youth was spent in sympathetic touch with that picturesque beauty of nature for which the region is famed. Mrs. Eddy's great-grandfather, Captain Joseph Baker, was a man of honored reputation and bore a commission conferred by the Provincial Assembly. Her father and grandfathers were sturdy husbandmen who served God and their country as best they knew, and fostered in their children the elements of a noble character. The intellectual tastes and assertive strength of her father, and the piety and loving winsomeness of her mother, were united in her nature, and one who knew her intimately in her girlhood has spoken of her as being distinguished even then for "her superior ability and scholarship, her depth and independence of thought, and her spiritual-mindedness," all of which were but prophecies of her character, her ministry, and eminence as a religious leader.

She was a student of Sanbornton Academy, and later pursued her studies under Prof. Dyer H. Sanborn, and her brother Albert, who was a gifted and scholarly man. At 16 her fertile pen, as well as her ceaseless inquiry and investigation, began to disclose that impelling and insatiable instinct of the poet and truth-seeker which in later years was to achieve such beneficent and far-reaching results. In all the years which were revealing to her the vanity and unsatisfactoriness of earthly hopes, she was seeking, in the quiet cloisters of spiritual aspiration, for that revelation of truth which would bring her heart assurance and peace. Unaccompanied save by patient and unflinching faith, she followed that ascending path which leads from the plane of common experience to the higher levels of spiritual apprehension, and in an hour of hopeless physical suffering she reached such a realization of the present healing potency of the Master's word that she was immediately made whole. Mrs. Eddy's life since this epoch-making experience and discovery in 1866 has been devoted to that interpretation of the teaching of Jesus, and the practical application of its saving truths to human need, which she has denominated Christian Science.

Her great work, 'Science and Health with Key to the Scriptures,' was published in 1875, and has now reached its 280th edition. This is the text-book of Christian Science, embodying not only its teaching, but the practical rules by which every sincere inquirer may avail himself of its benefits. She has written and published many other works relating to Christian

EDDY — EDDYSTONE ROCKS

Science, including 'Miscellaneous Writings,' 471 pp.; 'Retrospection and Introspection,' 120 pp.; 'Pulpit and Press,' 132 pp.; 'Unity of Good,' 80 pp.; 'Rudimental Divine Science,' 35 pp.; 'No and Yes,' 55 pp., and many other pamphlets, poems, annual messages to the Mother Church, etc. She has organized and conducted the movement, established its periodicals and educational system, and as leader, lecturer, teacher, editor and counselor has accomplished a work whose magnitude, substantiality, and success are a marvel to men.

The First Church of Christ, Scientist, the "Mother Church," in Boston, Mass., was chartered in 1879, and the church edifice was completed in 1895. Its present membership is about 28,000. Seven hundred and sixty-five Christian Science churches and societies, many of them provided with splendid church edifices, are now found in America, England, and other countries.

Mrs. Eddy has ever been known as a very generous and public-spirited woman. Her public and private benevolences have been large, amounting to hundreds of thousands of dollars. She recently gave \$100,000 toward the erection of an adequate Christian Science church in her native town.

Beloved and honored by all who know her, Mrs. Eddy lives in modest retirement at her country home in Concord, N. H., where, with unabated vigor and untiring devotion, she continues to direct that beneficent movement with which her name will ever be associated.

JOHN BUCKLEY WILLIS,

2nd Ed. C. S. Publications, Boston, Mass.

Eddy, Richard, American Universalist clergyman: b. Providence, R. I., 21 June 1828. During the Civil War he served as chaplain of the 60th New York Volunteers 1861-3. In 1877 he was made the president of the Universalist Historical Society, which office he still holds. He was editor of 'The Universalist Quarterly Review' (1884-91) and of the 'Universalist Register' since 1887, and is a prominent prohibitionist. He has published: 'History of Sixtieth New York State Volunteers' (1864); 'History of Universalism in America 1836-86' (1884-6); 'Alcohol in History' (1887); 'Alcohol in Society' (1888); 'Universalism in Gloucester, Mass.' (1892); 'History of Universalism A.D. 120-1890' in American Church History series (1894); and 'Life of Thomas J. Sawyer, D.D., and Caroline M. Sawyer' (1900).

Eddy, Thomas, American philanthropist: b. Philadelphia, Pa., 5 Sept. 1758; d. New York 16 Sept. 1827. He entered the insurance business in 1790, in which he made a large fortune. With Philip Schuyler and Ambrose Spencer he presented a bill for establishing a penitentiary system in 1796, which was passed. He had charge of erecting the first building and for four years was its director. In 1793 he was appointed by the Society of Friends to visit the Indians in New York State; was one of the governors of the New York Hospital; and in 1815 one of the founders of the Bloomingdale Insane Asylum. He was also one of the originators of the New York Savings Bank and the New York Bible Society, and a conspicuous promoter of the Erie Canal. He received the title of the "American Howard" for these labors, and in 1801 published 'State Prison of New York.'

Eddy, Thomas Mears, American clergyman: b. Newton, Hamilton County, Ohio, 7 Sept. 1823; d. New York 7 Oct. 1874. He studied in the classical seminary of Greensboro, Ind., and joined the Indiana Methodist conference in 1842. He was editor of the 'North-western Christian Advocate' from 1856 to 1868; served as pastor in Baltimore for three years; was appointed to the Metropolitan church in Washington, D. C., in 1872, and in the same year he was elected corresponding secretary of the Methodist Missionary Society. He was eminent as a journalist and was an author of no mean ability. Among his works was a 'History of Illinois during the Civil War' (2 vols. 1865).

Eddy Currents are short local currents set up in the iron masses of dynamo electric machinery; according to the law of Lenz they absorb a part of the energy expended in running the machine. The usual way of preventing them is to construct the parts affected, namely, the pole pieces and the armature cores, of laminæ built up so that the mass of the iron is divided by planes in a direction perpendicular to the direction of the electromotive forces tending to start the eddies.

Eddystone Lighthouse. The frequent shipwrecks on Eddystone rocks off the coast of Cornwall, England, led to the erection of a lighthouse on them by Henry Winstanley in 1696-1700. It was a wooden polygon, 100 feet high, with a stone base; but the great storm of 20 Nov. 1703, completely washed it away, with the architect. Another lighthouse was built in 1706-9, also of wood, with a stone base, and 92 feet high, by Mr. Rudyerd, a silk-mercator. This erection was burned in 1755. The next, noted for its strength and the engineering skill displayed in it, was constructed by Smeaton in 1757-9, on the model, it is said, of the trunk of the oak tree. It was built of blocks, generally one to two tons weight, of Portland oolite, encased in granite. The granite was dovetailed into the solid rock, and each block into its neighbors. The tower, 85 feet high, had a diameter of 26 $\frac{3}{4}$ feet at the base and 15 feet at the top. The light, 72 feet above the water, was visible at a distance of 13 miles. As the rock on which this tower was built became undermined and greatly weakened by the action of the waves, the foundation of another was laid on a different part of the reef in 1879. The new lighthouse, completed in 1882 by Sir James N. Douglass, is, like its predecessor, ingeniously dovetailed throughout. Its dioptric apparatus gives, at an elevation of 133 feet, a light equal to 159,600 candles, and visible in clear weather to a distance of 17 $\frac{1}{2}$ miles. See EDDYSTONE ROCKS; LIGHT-HOUSE.

Eddystone Rocks, well known to seamen who navigate the English Channel, consisting of three principal ridges, and extending 600 or 700 yards in length. They lie nearly in the fair way from the Start to the Lizard, and are therefore an object of the utmost importance to mariners. On the summit of the largest rock a lighthouse has been erected, to serve as a beacon or signal to avoid the danger, as they are covered at the flood tide, but become dry at the ebb. It is situated 15 miles south-southwest of Plymouth, 45 east of Lizard Point; lon. 4° 16' W.; lat. 50° 10' 54" N. The swell at these

EDELFEIT — EDENTATA

rocks is tremendous. After a storm, when the sea is to all appearance quite smooth, and its surface unruined by the slightest breeze, the ground-swell or under-current, meeting the slope of the rocks, often causes the sea to rise above the lighthouse in a magnificent manner, overtopping it as with a canopy of foam. See **EDDYSTONE LIGHTHOUSE**.

Edelfelt, ä'dël-fält, **Al'bert Gus'tav A'ristid**, Finnish painter: b. Helsingfors, Finland, 21 July 1854. He began his artistic studies at Antwerp and afterward became a pupil of Gérôme, in Paris, where he developed a high skill in draughtsmanship, in the department of genre and portrait painting. He gained a second medal in the Paris Salon of 1882, and a medal of honor in the Paris Exposition of 1889. Two of his pictures have been purchased by the French nation for the Luxembourg.

Edelinck, ä'dël-ink, **Gerard**, Flemish engraver: b. Antwerp 20 Oct. 1649; d. Paris 2 April 1707. He was patronized by Louis XIV., and produced over 420 plates.

Edelweiss, ëd'ël-wis, Ger. ä'dël-vis ("Noble-white"; *Gnaphalium* or *Leontopodium alpinum*), a perennial plant of the order *Compositæ*, growing at great altitudes in the Alps, the Pyrenees, and also in parts of Austria and Siberia. Its flower is white and somewhat star-shaped, the heads surrounded with a characteristic woolly involucre, and its leaves also having the same woolly character. It is comparatively scarce; generally grows in inaccessible positions; is eagerly sought by Alpine tourists, and has become so rare in some of the Swiss cantons that it is protected by law. The supposed difficulty of gathering it is the groundwork of various legends and poems; as the emblem of purity, it is given by the Tyrolean youth to his affianced bride. It is not difficult to cultivate and is found in American and European gardens, but is apt to lose its distinctive woolly character under cultivation.

Edema. See **DROPSY**.

Eden, Emily, English novelist and traveler: b. Old Palace Yard, Westminster, 3 March 1797; d. Richmond, England, 5 Aug. 1869. Among her works are: 'Portraits of the People and Princes of India' (1844); 'The Semi-detached House' (1859); 'The Semi-attached Couple' (1860).

Eden, Sir Robert, last proprietary governor of Maryland: b. Winderstone Hall, Durham, England; d. Annapolis, Md., 2 Sept. 1784. As captain in the Coldstream Guards he served in the Seven Years' war. He was appointed governor of Maryland in 1768, where he remained until 1776, when that State committed itself to the principles of the Revolution, and virtually declared the proprietary governorship at an end. He left in an English warship, but returned a few months before his death. See **Steiner**, 'Life and Administration of Sir Robert Eden.'

Eden, William. See **AUCKLAND, WILLIAM EDEN, LORD**.

Eden, the garden of paradise. It would be difficult in the whole history of opinion, to find any subject which has so invited and at the same time so completely baffled conjecture, as the Garden of Eden. The three continents of the Old World have been subjected to the

most rigorous search; but no locality which in the slightest degree corresponded to the description of the first abode of the human race has been left unexamined. Philo Judæus (flourished about 20) first broached the allegorical theory of interpretation, teaching that paradise shadowed forth the governing faculty of the soul, and that the tree of life represented religion, the true means of immortality. Origen, adopting a somewhat similar view, regarded Eden as heaven, the trees as angels, and the rivers as wisdom; and Ambrosius considered the terrestrial paradise and the third heaven, mentioned by St. Paul (2 Cor. xii. 2-4), as identical. Luther taught that Eden was guarded by angels from discovery and consequent profanation until the Deluge, when all traces were destroyed. Swedenborg, who regarded the first 11 chapters of Genesis as constituting a divine allegory, taught that Eden represented the state of innocence in which man was originally created and from which he degenerated in consequence of the Fall. The account given in Genesis of the situation of Eden is not such as to enable us to identify it with any existing locality. It is said to have had a garden in the eastern part of it, and we are told that a river went out of Eden to water this garden, and from thence it was parted into four heads, which were called respectively Pison, Gihon, Hiddekel, and Euphrates (Phrat). The Pison is said to compass the whole land of Havilah; the Gihon that of Ethiopia (Cush); and the Hiddekel to go toward the east of Assyria. Of the rivers mentioned the Phrat of the original seems to have been correctly identified with the Euphrates, and the name Hiddekel appears elsewhere in Scripture (Dan. x. 4) to be applied to the Tigris; but it is impossible to say what rivers or places were meant by the names Pison, Gihon, Havilah, and Cush. See **ADAM**.

Eden, a river in England, rising in a hill in Westmoreland, near the northwest boundary of Yorkshire; flows northwest, passing Appleby and Carlisle, and empties into the Solway Firth. Total course, about 50 miles.

Eden of America, a name bestowed on the island of Aquidneck, off the coast of Rhode Island, on account of its great fertility.

Edenhall, the ancient seat of the Musgraves in Cumberland, four miles northeast of Penrith, England. Here is still preserved the famous "Luck of Edenhall," an old painted glass goblet, said to have been snatched from the fairies, on the safety of which the welfare of the house depends. It is supposed to have been a chalice, and its leathern case bears a sacred monogram. Uhland's well-known ballad, 'The Luck of Edenhall,' has carried its fame beyond the British islands.

Edentata, ë-dën-tä'ta, one of the smaller orders of mammals, most of which are found in South America. It includes the South American sloths, ant-eaters, and armadillos, and two Old World groups, all of which are characterized by an absence of front teeth, and in a few instances, of completely toothless jaws, whence the generic name. Where teeth are present they are without enamel, and lack distinct roots, are all alike, and generally are not preceded by a set of milk teeth. These animals are ranked comparatively low in the scale of

mammals, not only on account of their deficiency in teeth, but also because their brains are relatively small, and lack the convolutions characteristic of the more highly developed orders. With two exceptions, the armadillos and pangolins, the Edentata are clothed with coarse hair. The armadillos are peculiar among mammals, in that their bodies are covered with an armor of bony plate; and in the pangolins the entire body is protected by a coat of overlapping, horny scales. The typical edentates are the sloths (*Tardigrada*), the ant-eaters (*Vermilinguia*), and the armadillos (*Loricata*), all of which are American; the two groups in the order, native to Africa and Asia, are the pangolins (*Squamata*), and the aard-varks (*Fodientia*), although Lydekker questions the correctness of placing the last two among the edentates, preferring to consider the present and extinct forms as an entirely American order. The sloths live on vegetable food exclusively, the other group chiefly on insects or animal matter softened by decay.

Fossil Edentates.—Of the large and numerous edentate fauna which lived in South America during the Tertiary and Quaternary periods, some (*Mylodon*, *Megalonyx*, *Glyptodon*) spread to North America during the Pliocene and Pleistocene epochs; the armadillo is still found as far north as the Mexican border of the United States. Their earliest ancestors were, perhaps, North American, but their development was exclusively in the southern continent during most of the Tertiary Period. The earlier stages in their evolution were of small or moderate size; later on they became of huge size and very highly specialized. The most remarkable among them were the *Megatheriida* of the *Bruta* order, ground-sloths, distantly related to the modern true sloths, but terrestrial animals, very heavily proportioned, with massive hind quarters and tail, and immense digging claws; and the *Glyptodonts*, related to armadillos but much longer, with massive unjointed carapace like that of a tortoise, and with hoofs instead of claws. Besides these were numerous true armadillos, both large and small, some ancestral to the modern species, others of extinct races. No fossil ant-eaters have yet been discovered, and fossil tree-sloths are almost equally unknown; but the fossil beds of South America have been so imperfectly explored that this fact is not surprising.

Edenton, N. C., town, county-seat of Chowan County; on the Albemarle Sound, near the mouth of the Chowan River; on two branches of the Norfolk, Va., B. & S. R.R.; about 90 miles north of Beaufort and 115 miles northeast of Raleigh. Four steamship lines enter Edenton, thus making it a good shipping point for the trade of the northeast part of the State. The shallow waters of the Albemarle Sound are a hindrance to more extensive shipping. The name given to the town when founded in 1712 was Queen Anne's Creek, but this was changed to Edenton in honor of a governor of the colony, Charles Eden. In less than one year after the "Boston Tea Party" a number of the housewives of Edenton resolved not to assist in supporting England by paying a tax on tea; and they formed themselves into an organization, none of whose members should drink tea. In addition to being first among

those who held Revolutionary tea parties, they seem to have been pioneers in America in the formation of organizations for women. The chief industries are lumbering and fishing. Pop. 3,210.

Eder, á'dér, Joseph Maria, Austrian chemist: b. Krems on the Danube 16 March 1855. He taught photo-chemistry at the Technical School, Vienna, and 1882 was made professor of chemistry at the Industrial School in that city. He has made great contributions to the development of the art of photography, particularly with reference to the use of chloride or bromide of silver. He also invented a photometre for measuring the invisible ultra violet rays by the oxalate of mercury. Among his works are: 'Photographie aux sels de chrome'; 'Etudes sur l'action de la lumière colorée' (1879); 'Manuel de photographie' (1882).

Edes, Robert Thaxter, American physician: b. Eastport, Maine, 23 Sept. 1838. He was graduated at Harvard 1858, and at the Harvard Medical School 1861; served as surgeon in the United States navy 1861-5; was professor of materia medica 1870-84; and professor of clinical medicine 1884-6 at the Harvard Medical School. He was physician at the Boston City Hospital 1872-86, and at the Garfield Memorial Hospital, Washington, 1889-91, and resident physician at the Adams Asylum 1891-7. Among his works are: 'Nature and Time in the Cure of Diseases' (1868); 'Physiology and Pathology of the Sympathetic or Ganglionic Nervous System' (1869); 'Therapeutic Handbook of the United States Pharmacopœia' (1883); 'Therapeutics and Materia Medica' (1887); and many contributions to medical journals at home and abroad.

Edes'sa, the name of two ancient cities.

(1) The ancient capital of Macedonia, and the burial place of its kings, now Vodhena. It is probably the same with the still more ancient *Ægæ*. (2) An important city in the north of Mesopotamia, which, subsequent to the establishment of Christianity, became celebrated for its theological schools. During the centuries which were affected by the Christianizing of Rome, Edessa became the centre of learning of Syria. (See SYRIA; SYRUS.) The modern city of Urfah or Orfa stands on the site once occupied by Edessa. (See URFAH.) In 1089, in the first crusade, Edessa came into the hands of Baldwin, but ultimately became part of the Turkish empire. It was one of the greatest four cities of Syria, the other three being Antioch, Damascus, and Nisibis.

Edfu, ăd'foo, town of Upper Egypt; situated on the Nile, 54 miles southeast of Thebes. It contains the remains of two temples, the larger of which is the best preserved monument of its kind in Egypt. It was founded by Ptolemy III. Philopator more than two centuries before Christ, and added to by his successors down to Ptolemy XIII. Dionysus, a period of 170 years. The general plan of the temple resembles that of Dendera. Its length is 451 feet, the breadth of its façade is 250 feet. Its entrance is by a gateway 50 feet high, between two immense truncated pylons, 37 feet wide at the base, and 115 feet high, the whole surface covered with sculptures and inscriptions

in low relief. This splendid façade is visible from a great distance, and is one of the most commanding sights in the Nile valley. Passing through this entrance, a court is reached 161 feet long, and 140 feet wide, enclosed by a splendid colonnade of 32 columns of every variety of capital, and surrounded by walls between which and the pillars there is a stone roof, forming a covered portico. From this court opens a hypostyle hall of 18 columns, joined by an intercolumnal screen, through which access is obtained to an inner hall of 12 columns, leading to the sanctuary, where a great monolith of gray granite was evidently intended to encase the hawk, the sacred emblem of Hor-Hud, the local Horus, to whom the temple was dedicated.

The sanctuary and surrounding chambers, together with the outer and inner halls, are separated by an open corridor from the outer wall of the temple, and both sides of this passage are covered with elaborate reliefs and numerous inscriptions, which present a sort of encyclopædia of ancient Egyptian geography, ritual, and ecclesiastical topography, with calendars of feasts, lists of divinities in the various names and cities, and even a species of church directory, including the names of singers and other temple officials. The smaller temple, erected by Ptolemy Physcon and Lathyrus, consists of only two chambers. The manufactures of Edfu at present are blue cotton cloths, and earthen-ware similar to the ancient Egyptian pottery. Pop. 2,500.

Consult: Wiedemann, 'Religion of the Ancient Egyptians'; Mariette, 'Monuments of Upper Egypt.'

Edgar ("THE PEACEABLE"), one of the most distinguished of the Saxon kings of England, was the son of King Edmund. He succeeded to the throne in 958, and managed the civil and military affairs of his kingdom with great vigor and success. He maintained a body of troops to control the mutinous Northumbrians, and repel the incursions of the Scots, and fitted out a powerful navy to protect his subjects from the Danes. During the reign of Edgar wolves were nearly extirpated from the southern parts of the island, by exchanging a tribute from Wales for payment in the heads of these animals. He married Elfri, daughter of the Earl of Devonshire, in 965. It was during his reign that Dunstan was primate of England. (See DUNSTAN, SAINT.) He died in 975, and was succeeded by his son, Edward the Martyr.

Edgar Atheling, Anglo-Saxon prince: b. Hungary about 1057; d. toward the end of the 11th century. He was a grandson of Edmund Ironside, and his life may be epitomized as a series of abortive attempts. Selected by Edward the Confessor as his prospective heir, he was kept out of the throne by William the Conqueror (1066); having twice engaged in the northern revolts against the Normans, he was twice compelled to take refuge in Scotland, with Malcolm Canmore, who married Edgar's sister, Margaret; then, embracing the cause of Robert, Duke of Normandy, against William Rufus, he was driven away (1091) from the duchy to Scotland; then he embarked (1099) in a bootless crusading expedition to the East; and finally was taken prisoner at Tenchebrai (1106) fighting for Duke Robert against his brother Henry I. Almost the only successful achievement of his life

seems to have been that of reseating his nephew Edgar on the throne of Scotland (1097), which had been usurped by Donald Bane. His last days were spent in obscurity; the date of his death is not precisely known.

Edgar, James David, Canadian statesman: b. Hatley, P. Q., 10 Aug. 1841. He was admitted to the bar 1864, first practising in Toronto; was made a Q.C. by the Ontario government in 1890. In 1872 he was elected to Parliament for Monck, being chief Liberal "Whip"; served on a political mission to British Columbia, and was re-elected from West Ontario 1884. He was elected speaker of the commons in the new parliament 1896, and was instrumental in passing the Canadian Copyright Act 1889. Later he devoted much attention to the question of international arbitration. He was elected a Fellow of the Royal Society of Canada 1897. He has published: 'The White Stone Canoe' (1887); 'This Canada of Ours and Other Poems' (1893); an 'Annotated Edition of the Insolvent Law' (1864); and several other law books.

Edgar, John George, English biographer and historian: b. 1834; d. 1864. In business at Liverpool, he left it for literature: edited 'Every Boy's Magazine,' contributed to the London press, and wrote biographies and histories, mainly for the young; among them: 'The Boyhood of Great Men' (1853); 'Footprints of Famous Men' (1853); 'Crusades and Crusaders' (1859); 'Sea Kings and Naval Heroes' (1860); 'Cavaliers and Roundheads' (1861).

Edgartown, Mass., town, county-seat of Duke's County; situated on the eastern shore of the island of Martha's Vineyard. At present it is a summer resort, but it was once a whaling station of importance. The town was settled in 1642. Pop. (1900) 1,209.

Edgcumbe, ěj'cūm, **SIR EDWARD ROBERT PEARCE**, English traveler: b. 13 March 1851. He was educated at Cambridge, was mayor of Dorchester 1891, and sheriff of Cornwall 1896. He has published: 'Zephyrus, or Travels in Brazil and on the River Plata' (1887); 'Bastiat's Popular Fallacies' (4th ed. 1893); 'Popular Fallacies Regarding Bimetallism' (1896); 'The Parentage and Kinsfolk of Sir Joshua Reynolds' (1901).

Edgehill, ěj'hīl, England, an eminence in Warwickshire, 12 miles south of Warwick. Here was fought the first battle of the civil war, Sunday, 23 Oct. 1624, between the Royalists under Charles I. and the forces of the Parliament under the Earl of Essex. It was an indecisive engagement.

Edgeworth, ěj'wërth, **Maria**, English novelist: b. Hare Hatch, near Reading, Berkshire, 1 Jan. 1767; d. Edgeworthstown, Ireland, 21 May 1849. In 1782 her father, Richard Lovell Edgeworth, succeeded to the family estate of Edgeworthstown, in the county of Longford, Ireland, and thither he proceeded and took up his abode. In 1802 she established her position as an author by her 'Castle Rackrent,' a novel of Irish life, in which the manners and customs of a by-gone generation are most graphically and humorously described. A 'Treatise on Irish Bulls' appeared in 1803, and about the same time she began the series of tales on which her fame will rest. These comprise: 'Moral Tales';

'Popular Tales'; and 'Tales of Fashionable Life', all written in the clearest and most vigorous style, without the least affectation of sentiment or fine writing. She also wrote: 'The Parents' Assistant,' a collection of tales for children, and the well-known series of 'Early Lessons'; 'Harry and Lucy'; 'Frank'; and 'Rosamond.' Belonging to the class of regular novels are 'Belinda'; 'Leonora'; 'Patronage'; 'Harrington'; and 'Ormond.' In estimating Miss Edgeworth's literary merits too much praise cannot be given to her terse and nervous style, alike simple and elegant, or to the lucidity and consecutiveness which characterize all her compositions. Her skill in plot is considerable, and the interest excited in the characters and issue of the story is never allowed to flag. See Thackeray Ritchie, 'Book of Sibyls' (1883); Zimmern, 'Life of Maria Edgeworth' (1883).

Edgren, Anne Charlotte Leffler, än shär-ldt'tē lēf-lēr ēd'grēn, Swedish novelist and dramatist: b. Stockholm 1 Oct. 1849; d. Naples 24 Oct. 1892. A volume of short tales, 'By Chance,' and the dramas, 'The Actress'; 'The Curate'; etc., were a great success anonymously; and she then put her own name to three successive volumes of short stories called 'From Life,' followed by 'A Summer Story'; 'Woman and Erotism'; and many others. 'Ideal Women'; 'The Struggle for Happiness'; and 'A Rescuing Angel' (the most successful of her plays), are notable among her later dramas.

Edgren, August Hjalmar, Swedish-American educator: b. Wernland, Sweden, 18 Oct. 1840. He came to the United States in 1860, joined the 99th New York Regiment as second lieutenant January 1862; and in August 1863 entered the engineer corps. He was connected with Yale University 1874-80, and since 1893 has been professor of Sanskrit and linguistic science at the University of Nebraska. His numerous publications include a Swedish work on the 'Literature of America' (1878); 'Swedish Literature in America' (1883); and 'American Antiquities' (1885); besides many valuable papers for students, pertaining to Sanskrit, romance, and Germanic philology.

Edhem Pasha, pash-â' or pāsh'ā, Turkish soldier and statesman: b. Scio of Greek parentage 1813. He studied in Paris, and on returning to Turkey was attached to the staff of the army with the rank of captain, rapidly attained that of colonel, and was appointed a member of the Council of Mines at the time of its formation. Having been appointed aide-de-camp to the Sultan in 1849, he soon was placed at the head of His Majesty's household troops. In 1856 he resigned the functions which he had fulfilled at the palace, and was appointed a member of the council of the Tanzimat, and afterward minister of foreign affairs, with the rank of muchir. Subsequently he played an important part in the affairs of his country, where he was nominated president of the Council of State. He was also for some time ambassador at Berlin. At the Conference of Constantinople (1876-7) he acted as the second Turkish plenipotentiary, and was appointed to succeed Midhat Pasha as grand vizier, 5 Feb. 1877.

Edhem Pasha, Turkish soldier: b. 1851. In 1877 he held the rank of colonel in the Turkish army and rose rapidly during the war with Russia. He was appointed governor-general of the Vilayet of Kossowo, and was later made adjutant-general and field marshal. In the war with Greece (1896-7) he had the chief command of the Turkish army.

Edible Birds' Nests. See BIRDS' NESTS, EDIBLE.

Edict, a public proclamation. In ancient Rome, the higher officers of state, who were elected annually, publicly declared, at their entrance upon office, the principles by which they should conduct their administration. This was done particularly by the ædiles, who superintended buildings and markets, and by the prætors, as supreme judges. These annual proclamations, by which the deficiencies of the general statutes were supplied, and the laws were adapted to the peculiar wants of the period, gradually acquired a certain permanency, as each officer retained, unaltered, most of the regulations of his predecessor (*edictum tralatitum*); and they became, in fact, the source of that branch of Roman law which, being founded on the official authority of the authors, was called *jus honorarium*, and was opposed to the strictly formal law, *jus civile*. Though according to Roman jurists these usually indirect forms of legislation had their object in rendering the civil law more expedient to the public welfare, and always received the seal of the people's approval. Edicts were sometimes made for some special occasion, in which case they were called *edicta repentina*. It was against the abuse of this kind of edicts that the Lex Cornelia in 67 B.C. was directed. Those which were applicable in all cases during the tenure of office of the magistrate who issued them were called *edicta perpetua*. The name of *edictum perpetuum* was also given to a collection and arrangement of the clauses which the prætors were accustomed to put into their annual edicts, made under the Emperor Hadrian by Salvius Julianus about 131 A.D. What the exact nature of the work thus done by Julianus was is not known, but the edict prepared by him, and sanctioned by imperial authority, had unquestionably a special force, and it is likely that it restricted in future the right enjoyed by magistrates of issuing edicts, to such cases as were not provided for in the edict of Julianus. Only a few fragments of the ancient Roman edicts have been preserved. See CIVIL LAW.

Edict of Nantes, a decree of Henry IV. king of France, published 13 April 1598, by which he conceded to the Huguenots, or Protestants of that kingdom, toleration for their religious beliefs, teachings, and practises; freedom of public worship and liberty to erect churches, except at Paris and the royal residences, and to maintain the four Protestant universities of Saumur, Montauban, Montpellier, and Sedan; admission as members to the parliament of Paris and the right to special chambers in the parliaments of Grenoble and Bordeaux; further, the right to hold provincial and national synods. In 1620 the Huguenots in their political congress at La Rochelle confiscated all the property of the Roman Catholic churches and constituted throughout France a military and civil organization for Huguenot ends.

EDINA — EDINBURGH

Before the formal revocation of the Edict of Nantes the liberties of the Protestants were largely restricted by partial acts of revocation, which precluded them from office in the government, from membership in trade corporations, etc., and from marriage with Roman Catholics. The edict was formally revoked by a decree of Louis XIV. 18 Oct. 1685. It ordered the churches of the Huguenots to be destroyed, forbade the holding of religious meetings and of synods by Protestants on penalty of confiscation of goods; banished all Protestant ministers; ordered the children of Protestants to be baptized and brought up as Roman Catholics. The Huguenots to the number of some 500,000 made for the frontiers or the coast and sought an asylum in Great Britain, Holland, Switzerland, Prussia, and the American colonies of England. In all those countries they proved themselves as artisans and artificers, a valuable accession to the nations that received them, and added materially to the strength of the enemies and the rivals of France, both in peace and in war.

Edi'na, Mo., city, county-seat of Knox County; on the Omaha, K. C. & E. R.R., about 110 miles north of Jefferson City. Its manufactures are principally lumber, flour, butter, wagons, and carriages; and the trade is chiefly in agricultural products, stock, and the imports needed for local consumption. Pop. 1,700.

Edina, or **Edin**, a synonym for Edinburgh, introduced by George Buchanan, and frequently met in Scottish poetry. See **DUNE EDIN**.

Edinburgh, ɛd-in-bŭr'ō, **Duke of** (PRINCE ALFRED ERNEST ALBERT), Duke and sovereign of Saxe-Coburg-Gotha, English prince: b. Windsor Castle 6 Aug. 1844; d. Coburg, Germany, 30 July 1900. He was the second son of Queen Victoria and at the age of 14 joined the navy as naval cadet, and served on various foreign stations. In 1862 he declined the offer of the throne of Greece. On his majority he was awarded an annuity of £15,000 by Parliament, and was created Duke of Edinburgh, Earl of Kent, and Earl of Ulster. In 1873 he received an additional annuity of £10,000, and next year married the Grand-duchess Marie, only daughter of the emperor of Russia. In 1882 he was made a vice-admiral, and subsequently held important commands, being also created admiral of the fleet. In 1893 he succeeded his uncle as ruler of Saxe-Coburg-Gotha, and resigned his annuity of £15,000. He was succeeded by his nephew, the Duke of Albany.

Edinburgh, **Edinburghshire**, or **Midlothian**, a maritime county of Scotland; area, 231,724 acres. The surface is hilly and the productions are about as in Scotland generally. The chief town is Edinburgh. (See **EDINBURGH**.) Pop. (1900) 488,647.

Edinburgh, Scotland, the chief city of Scotland, and one of the finest as well as most ancient cities in the British empire; lies within two miles of the south shore of the Firth of Forth. It is picturesquely situated, being built on three eminences and surrounded on all sides by lofty hills except on the north, where the ground slopes gently toward the Firth of Forth. The central ridge, which constituted the site of the ancient city, is terminated by the castle on the west, situated on a high rock, and by Holy-

rood House on the east, nor far from which rise the lofty elevations of Salisbury Crags, Arthur's Seat (822 feet high), and the Calton Hill overlooking the city. The valley to the north, once the North Loch, but now drained and traversed by the North British Railway, leads to the New Town on the rising ground beyond, a splendid assemblage of streets, squares, and gardens. The houses here, all built of a beautiful white freestone found in the neighborhood, are comparatively modern and remarkably handsome.

The principal streets of the New Town are Prince's Street, George Street, and Queen Street. Prince's Street is adorned with Sir Walter Scott's monument and other notable buildings. The principal street of the Old Town is that which occupies the crest of the ridge on which the latter is built, and which bears at different points the names of Canongate, High Street, Lawnmarket, and Castle Hill. This ancient and very remarkable street is upward of a mile in length, rising gradually with a regular incline from a small plain at the eastern end of the town, on which stands the palace of Holyrood, and terminating in the huge rock on which the castle is built, 383 feet above sea-level. The houses are lofty and of antique appearance. Among the notable buildings are the ancient Parliament House, now the seat of the supreme courts of Scotland; St. Giles' Church or cathedral, an imposing edifice in the later Gothic style, recently carefully restored; the Tron Church; Victoria Hall (where the General Assembly of the Established Church meets); the Bank of Scotland; besides some of the old family houses of the Scottish nobility and other buildings of antiquarian interest. At right angles to this main street and in regular rows are numerous narrow lanes called closes, many of them extremely steep, and very few at their entrances more than six feet wide; those which are broader, and admit of the passage of carriages, are called wynds. In these and the adjacent streets the houses are frequently more than 120 feet high, and divided into from 6 to 10 stories, or flats, the communication between which is maintained by broad stone stairs, winding from the lowest part of the building to the top. In the Old Town the most remarkable public building is the castle. This fortress contains accommodations for 2,000 soldiers, and the armory space for 30,000 stand of arms. In an apartment here is kept the ancient regalia of Scotland.

The palace of Holyrood, or Holyrood House, as it is more generally called, stands, as already mentioned, at the lower or eastern extremity of the street leading to the castle. No part of the present palace is older than the time of James V. (1528), while the greater portion of it dates only from the time of Charles II. In the north-western angle of the building are the apartments which were occupied by Queen Mary, nearly in the same state in which they were left by that unfortunate princess. Adjoining the palace are the ruins of the chapel belonging to the Abbey of Holyrood, founded in 1128 by David I. The Advocates' Library, the largest library in Scotland, contains upward of 250,000 printed volumes and 2,000 MSS.

On the southern side of the Old Town, and separated from it also by a hollow crossed by two bridges (the South Bridge and George IV.

Bridge), stands the remaining portion of the city, which, with the exception of a few unimportant streets, is mostly modern. Besides the buildings already noticed Edinburgh possesses a large number of important edifices and institutions, chief among which are the Royal Institution (containing accommodation for various bodies), the National Gallery of Scotland, the Museum of Science and Art, the new Episcopal Cathedral of St. Mary's, etc. Among the more prominent educational institutions are the university, the high school, the academy, the New or Free Church Theological College, the United Presbyterian Theological Hall, the Edinburgh School of Medicine, the Veterinary College, the Fettes College, the Heriot-Watt College of Science and Literature. The manufactures of Edinburgh are neither extensive nor important. Printing, book-binding, coach-building, type-founding, machine-making, furniture-making, ale-brewing, and distilling are the principal industries. Edinburgh is the headquarters of the book trade in Scotland, and the seat of the chief government departments.

The origin of Edinburgh is uncertain. Its name is thought to be derived from Eadwinsburgh, the Burgh of Edwin, a powerful Northumbrian king who absorbed the Lothians in his rule. The town was made a royal burgh in the time of David I.; but it was not till the 15th century that it became the recognized capital of Scotland. Pop. (1901) 316,479.

Edinburgh Review, The, one of the most celebrated of English quarterlies. It was established in October 1802, at a time when the periodical literature of Great Britain consisted of works conducted with inferior talent and occupying narrow grounds. Its success was immediate. All the great subjects of literature, science, philosophy, and politics were discussed in it with boldness, spirit, varied learning, acute reasoning, elegant criticism, a piquant satire, and original views. It was started by a number of young men in Edinburgh who were accustomed to meet occasionally to discuss questions connected with literature, politics, philosophy, and poetry. The principal of these were Henry Brougham (q.v.), Francis Jeffrey (q.v.), Sydney Smith (q.v.), and Francis Horner. It was edited for a few numbers by Sydney Smith; afterward Jeffrey was the editor from 1803 to 1829, and was one of the most fruitful contributors throughout the long time during which he conducted it. Under his editorship the periodical reached the highest summit of its prosperity, when it had from 12,000 to 13,000 subscribers. Jeffrey was succeeded by Macvey Napier. Among the principal writers (besides those above mentioned) are to be found the names of Playfair, Leslie, Sir Walter Scott, Sir W. Hamilton, Mackintosh, Dugald Stewart, Dr. Thomas Brown, Carlyle, Macaulay, James Mill, Hallam, etc. At present the quarterly is published in London, and upon its centenary (1902) issued a commemorative number.

Edinburgh, Treaty of, an engagement negotiated 6 July 1560, between Queen Elizabeth and the Scots for the evacuation of Scotland by the French. By this treaty Francis II. and Mary fully recognized the right of Elizabeth to the English crown, and agreed that Mary, in time to come, should neither assume the title nor bear the arms of England.

Edinburgh University, the latest of the Scottish universities, was founded in 1582 by a charter granted by James VI. The government, as in the other Scottish universities, is vested in the *Senatus Academicus*, the university court, and the general council. The chancellor of the university is elected for life by the general council. He is the head of the university and the president of the general council. The rector is elected for a term of three years by the matriculated students. He presides over the university court. The principal is the resident head of the college and president of the *Senatus Academicus*. The university court consists of the rector, principal, the lord-provost of Edinburgh, and assessors appointed by the chancellor, town council of Edinburgh, the rector, the general council, and the *senatus* respectively. The general council consists of the chancellor, the members of the university court, the professors, and all graduates of the university. There are four faculties, namely, arts, divinity, law, and medicine. Women may now graduate in arts, science, and medicine. The medical department has an international reputation and attracts students from all parts of the world. Some of the professors are appointed by the crown, others are elected by the university court and by special electors, and a considerable number by the curators, who also elect the principal.

In 1902 the teaching staff numbered 105, and the students about 3,000. The degree of M.A. is conferred on all who have completed their course and passed the ordinary examinations in the classical department (Latin and Greek), the department of mathematics and natural philosophy, and that of logic and metaphysics, moral philosophy, and rhetoric and English literature. Three medical degrees are conferred: Bachelor of Medicine (M.B.), Master in Surgery (C.M.), and Doctor of Medicine (M.D.). The degrees in law are Bachelor of Laws (LL.B.), Bachelor of the Law (B.L.), and Doctor of Laws (LL.D.). The last is purely honorary. The degrees of Bachelor of Divinity (B.D.), and Doctor of Divinity (D.D.), the latter honorary, are bestowed in the faculty of divinity. Degrees in science are also conferred. The degree of D.Sc. is conferred in the physical, in the natural, and in the mathematical sciences, in engineering, in public health or sanitary science, in mental science, and in philology. That of B.Sc. is conferred only in mathematical, physical, and natural science, in engineering, and in public health. The present university buildings were begun in 1789. The library of the university contains about 170,000 printed volumes, besides 2,000 manuscripts. There is also a separate theological library containing about 10,000 volumes. There are various bursaries, scholarships, and fellowships, amounting annually to about \$50,000.

Edis, Robert William, English architect: b. Huntingdon, England, 13 June 1839. He was president of the Architectural Association for two years, and among his constructions may be mentioned the club houses of the Constitutional, Junior Constitutional, and Badminton clubs, London; and the Conservative Club, Glasgow; The Great Central Hotel, London, and the Inner Temple Library. He has written and lectured much upon domestic art and house sanitation, and is a strong advocate of the extended use of

EDINBURGH.

2. The Old Town, from Princess Street.

THOMAS ALVA EDISON,
AMERICAN ELECTRICIAN AND INVENTOR.

EDISON — EDISON PORTLAND CEMENT WORKS

terra-cotta in building. He has published: 'Decoration and Furniture of London Houses'; 'Hand-book on Healthy Furniture'; etc.

Edison, Thomas Alva, American electrician and inventor; b. Milan, Ohio, 11 Feb. 1847. His family moved to Port Huron, Mich., when he was seven years of age, but he obtained no schooling, and at the age of 12 became a train-boy on the Detroit and Port Huron branch of the Grand Trunk Railway. While in this capacity, in 1862, he bought a small hand press and edited, printed, and published a small paper of his own, naming it the 'Grand Trunk Herald.' It had a circulation of 300 among the employees of the road. For the rescue of the son of a station agent he was taught telegraphy by the father, and later became an operator at Mount Clemens, but, owing to his dislike of routine work, his fondness for reading, and his inventive genius, he lost several subsequent positions, and became a "tramp operator," although known to be remarkably proficient. While in Indianapolis in 1864, he invented an automatic telegraph repeater, the first of a long series of improvements and inventions. He soon after went to Boston, where he invented a commercial stock indicator, which he sold to New York capitalists for \$40,000. This gave him the long-cherished opportunity of establishing an extensive laboratory, which he did at Newark, N. J., for the special manufacture of electrical, printing, automatic and other apparatus. In 1876 his health failed and he gave up manufacturing, confining his labor to investigation and invention. He established his laboratory at Menlo Park, N. J., and later at West Orange, N. J., gave employment to hundreds of workmen and became known as one of the greatest inventors of the 19th century. More than 300 patents have been issued on his inventions, and he has besides produced hundreds of minor contrivances and improvements not covered by patents. Among his more important inventions may be named the phonograph, a telephone for long distance transmission, a system of duplex telegraphy (which he subsequently developed into quadruplex and sextuplex transmission), the carbon telephone transmitter, the microtasmeter, the zephophone, megaphone, the incandescent electric lamp, the kinetoscope, and a storage battery for street railway cars and automobiles. There is not an electrical instrument, or an electrical process now in use, but bears the mark of some great change wrought by the most ingenious of Americans. In 1878 he was made chevalier of the Legion of Honor by the French government, a commander of the Legion in 1889, and was the recipient of the insignia of a grand officer of the Crown of Italy bestowed the same year by King Humbert. In 1892 he received the Albert medal of the Society of Arts of Great Britain.

Edison is a man of remarkable personality. To those who believe his work is the product of an inspiration given by nature to but few, the story of the manner in which he achieves success will seem shockingly unromantic. In the genius who works by inspiration Edison has no great faith. "Genius is 2 per cent inspiration and 98 per cent perspiration," is the incisive, epigrammatic answer he once gave to a man who thought that a genius worked only when the spirit moved him. Not being given to scientific

rhapsodies, Edison does not concern himself with what may be of service a century hence; he confines himself rigorously to the needs of the present. Knowing full well that he is probably not the first who has set for himself the task in the performance of which he is engaged, he reads all that is pertinent to his subject in the vast library which forms an important adjunct of his laboratory. Not content with the information gathered from his own shelves his literary agent is ordered to send him more. After a thorough review of his subject, Edison begins laboratory work—an expert keenly alive to the failures of his predecessors, careful to avoid useless repetitions of old experiments. It is now that the 2 per cent inspiration gained by exhaustive reading, and the 98 per cent perspiration which he is ready to expend, are applied. Experiments are made; not a few, but hundreds and even thousands. Model after model is built. Failure upon failure is met with, until further efforts seem hopeless. Undismayed, Edison performs more experiments, builds more models. Failure spurs him on. At last an experiment is performed or a model made which gives faint encouragement. So far from being elated, he regards the promising result with great suspicion. The failures have been too many; the apparent success after all may be due to an accidental combination of circumstances that may never occur again. Only after the partial triumph has been confirmed by many trials does complete assurance come. Edison knows exactly what he wishes to accomplish, and how his end is to be attained. Absolute certainty of purpose and of method saves him from frittering away his time in useless experimentation. Chance has given perhaps an occasional idea, but it has not lightened his work. Tireless perseverance and long hours of work are the secrets of Edison's success. In 1897 Edison devoted his exclusive attention to the invention of a new storage battery, on which problem he had been engaged for some five years. For over a year he worked harder than a day laborer. He was at his laboratory at 7.30 in the morning. His luncheon was sent to him. In the evening he left for dinner, but returned at 8. At 11.30 at night his carriage called for him; but often the coachman had to wait for three or four hours until the inventor came out of his laboratory. Yet when vacation time comes, and with it a chance to leave his laboratory, Edison plays just as he works, with his whole heart and soul. He will hear nothing of business. Science is thrown to the winds.

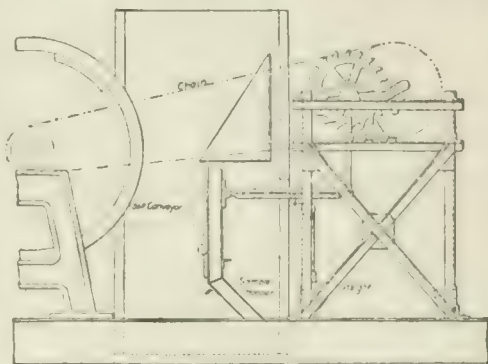

Edison Portland Cement Works, a manufacturing establishment located at Stewartville, N. J., and interesting for its employment of new methods, devised by the well-known inventor, T. A. Edison (q.v.), in the making of Portland cement. The rock, having been drawn on flat-cars to the crusher-house, is raised by electric hoists and dumped into the crushing-rolls. These rolls are arranged in four sets, one above the other, the material passing downward by gravity. The first set of rolls is 5 feet in length and diameter, the moving portions weighing approximately 25 tons each. They can receive and crush rocks of 5-ton weight, and are driven at a speed of 200 revolutions per minute. Beneath these rolls is a 10-ton hopper, from which the material is fed to three sets of

EDISON PORTLAND CEMENT WORKS

36-inch rolls. The rock in passing through the four sets is reduced to one half inch in size. The crusher house has a capacity of 3,000 tons per day of 24 hours, allowing for 16 hours of actual running and a maximum of 4 hours for stoppages. From the lowest set of rolls the crushed rock drops through a chute to a 24-inch belt conveyor, which transfers it to the top of the drier-house. Having arrived at the top of the drier-house, the material falls by gravity over screens composed of one half inch mesh screened plates. The rejected spalls are re-crushed and returned to the drier-house. The re-crushed material falls to the drier. The drier consists of a cast-iron box, 40 feet high and 8x8, filled with baffle-plates. Like the crusher, it has a capacity of 3,000 tons daily. The fall of the rock from the last screen to the bottom of the drier requires 26 seconds; the moisture in the crushed rock is reduced from 3 to 4 per cent to within 1 per cent. From the bottom of the drier stock a 24-inch belt conveyor transfers the dried rock to a transfer-tower, where it is received by another 24-inch belt conveyor, which passes along the entire length of the stock-house cupola, and deposits the rock in any bin desired by a self-propelling tripper. There are three bins for cement rock, three for lime rock, and one for mixing purposes. At the transfer tower an automatic sampler is installed, and this withdraws samples of the material as it is dumped from one conveyor to the other. By analysis of the material removed by the sampler, the general constituents of the material in any given bin may be ascertained. Great precautions are taken to dry the material in stock-house, should it become wet after leaving the drier. A 15-foot fan, passing 60,000 cubic feet of air per minute, creates a suction of warm air through the building from the furnaces at the other end, and thus removes excess moisture in the stored stock.

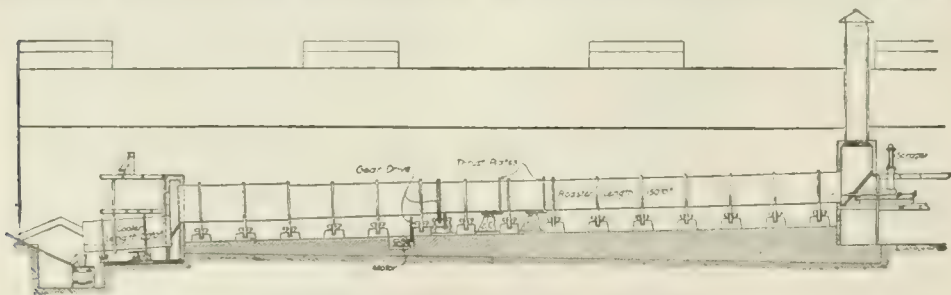

For the next step in the process of manufacture, the crushed rock emerges on a conveyor in a tunnel underneath the bins. By another conveyor it is raised to the first dump at the upper part of the weighing-house. Here are two bins, of 60 tons capacity each, one for the cement rock and one for the limestone. Beneath each of these bins is located a 10-ton weighing bin, the proper proportion of the raw

veyer which traverses the length of the building and passes two stationary trippers. Each tripper supplies 8 bins, whence the material is supplied to the discharge pipes of an equal number of fan-blowers. By a system of baffle-plates the material falls through the current of air maintained by the blower. The fine material is carried by the air-current to settling-chambers, whence it passes to bins. The coarse material is taken by conveyers to the chalk-grinding

The Automatic Sampler.

house for a further reduction. The set of fine grinding-rolls in the chalk-grinding house have a record of 280 barrels per hour. Of this ground material, 85 per cent passes through a sieve of 200 meshes per linear inch. From the stock-house, which has a capacity of 1,000 tons of chalk, the finely-ground material is conveyed to the burning plant. The kilns are of cast iron, 150 feet long and from 8 to 9 feet in exterior diameter. Each rotary kiln is supported on 30 wheels at 15 points of its length, and is moved at a speed varying from one revolution in 35 seconds to one in 40. The output of each kiln is about 750 barrels per day of 24 hours. The clinker formed by the vitrification of the chalk drops out at the lower end of the kiln into a revolving cylindrical cooler. Ordinarily the clinker from the cooler is spouted directly from the bucket conveyor. A second spout carries the clinker away to the bad clinker elevator. Thus defec-

A longitudinal section of one of the 150-foot kilns.

materials being secured in these latter bins. At the small rock stock-house begins a long tunnel, containing a 36-inch belt conveyor, which passes another raw-material or chalk-grinding house, where it receives the material furnished by the rolls, and whence it rises to the top of the blower-house. It is there received by a con-

veyer which traverses the length of the building and passes two stationary trippers. Each tripper supplies 8 bins, whence the material is supplied to the discharge pipes of an equal number of fan-blowers. By a system of baffle-plates the material falls through the current of air maintained by the blower. The fine material is carried by the air-current to settling-chambers, whence it passes to bins. to the clinker grinders; then to a second blower-house, where fine and coarse are separated, and thence to the stock-house. See CEMENT.

Edisto, ed'is-to, a river in South Carolina, which has its rise in the southern part of the State, and which flows in a general direction southeast into the Atlantic Ocean. Its source is at the junction of two streams called North and South Forks of Edisto River. The river is 150 miles in length and navigable for 100 miles.

Edmonton, Canada, city in the Province of Alberta, situated upon the North Saskatchewan river; on the Calgary and Edmonton branch of the Canadian Pacific and on the main line of the Canadian Northern R.R.'s.; 340 miles west of Prince Albert. It is the principal town in Northern Alberta, the newly chosen provisional Capital of the new Province, and with every probability of being confirmed in that position, despite the rival claims of Calgary. On the opposite bank of the river is the town of Strathcona, with its 3,000 or more people.

Industries and Business Interests.—A bustling railway centre; situated on a large and navigable river; built upon and in the centre of a great region of lignite coal; with cheap fuel for its people and its industries; surrounded by a rich agricultural and ranching country; the new capital of the new Province of Alberta has great resources for its future prosperity. The city owns and operates its electric light and power system, telephone and water works, and has obtained a charter to build and operate a street railway. It has six branch banks, four churches and two public schools. Its chief industries are saw, grist and planing mills, stock-raising and farming. It is the shipping point for a radius of, at least, 150 miles around. The net assessment in 1905 was \$6,620,985, as against \$673,694 in 1892 and the total taxes levied in 1905 were \$115,637, or a total rate of 20 mills on the dollar.

History, Government, and Population.—Commencing as a Hudson's Bay fort in 1795, Edmonton was, for three-quarters of a century, a mere market for furs and a central meeting and trading place for bands of Crees, Stonies, and other Indian tribes. Until the middle of the 19th century it was the furthest unloading point to the North for the York boats from Hudson's Bay and its first permanent white settlers came in caravans from Fort Garry (Winnipeg) 1,000 miles away in hopes that the projected Canadian Pacific Railway would adopt this route. In 1892 the northern branch line from that railway did arrive and on 9th January the town was incorporated. In 1897-8 the place became a centre and stamping-ground for the Klondike rush and many thousands of people passed along the Edmonton trail. The iron-bridge across the river to Strathcona was completed in 1901 and, in December 1905, the Canadian Northern Railway entered Edmonton. Meantime, on 7 Nov. 1904, it had been incorporated as a city with a civic government consisting of a mayor and 8 aldermen and an executive board of three commissioners. With a population in 1904 placed at 6,500 it is now (March, 1906) estimated to be 10,000.

J. CASTELL HOPKINS,
Editor of 'The Canadian Annual Review of Public Affairs.'

Edmonton, England, town in the county of Middlesex, on the New River, eight miles north of London. The "Bell at Edmonton" has become famous by association with the adventures of John Gilpin. Charles Lamb died at Edmonton in 1834. Pop. (1901) 46,899.

Edmund, Saint, king of the East-Angles: b. Nuremberg 841; d. Oxen, now Hoxon, England, 20 Nov. 870. Edmund belonged, by blood, to the English-Saxon kings, but was not a direct heir to the throne. When Edmund was only in his 15th year he was crowned by Humbert, bishop of Elma, on Christmas Day 855, at Burum, a royal villa on the Stour, now called Bures. In the 15th year of his reign the land was attacked by the Danes, and they laid waste all the country through which they passed. The king tried to protect his people, but the Danes outnumbered them and spared none. He was captured at Oxon and terms, prejudicial to religion, were offered and rejected. Hinguar, the Dane, ordered most terrible tortures to be inflicted. Again he was offered terms of surrender, and again he refused. Hinguar at last ordered his head to be cut off.

Edmund, Saint, Archbishop of Canterbury: b. Abingdon, England, about 1190; d. Soissy, France, 16 Nov. 1240. His first studies were made at Oxford and from there he was sent to Paris, from which school he returned home at the death of his mother; but remained in England only long enough to attend to placing his sisters in good homes. After returning to Paris he devoted himself to the study of theology and the Scriptures, and for a time taught the Scriptures in Paris. Returning to England, after his ordination, he became a teacher at Oxford from 1219 to 1226; he was the first who taught Aristotle's logic at Oxford. He desired to work among the poor, and at his own request was transferred to Salisbury Cathedral. While at Salisbury he received a commission from the Pope to preach the crusade against the Saracens, which he did with the result that not only many of his hearers joined the crusade, but numbers became exemplary Christians.

In 1234 Pope Gregory IX. appointed Edmund as Archbishop of Canterbury. The chapter of Canterbury was unanimous in his favor and the appointment was pleasing to the king, Henry III., but when Edmund was informed of the "honors heaped upon him," he at first refused to listen to the committee appointed to wait upon him. He assured them that they were mistaken, and, if not that he would not consent to become Archbishop of Canterbury. The bishop of Salisbury went to him and induced him to accept the office, and he was consecrated Archbishop of Canterbury on 2 April 1234. He at once entered upon a series of reforms in courts, monasteries, and among his clergy. Adversaries arose among those who ought to have been his advocates. His 'Constitutions' in 36 canons, dealing with matters of reform, are still extant. Troubles arose between Edmund and the king, when the king's greed sought various means to secure Church revenues. Both the archbishop and the king appealed to the Pope, who, failing to finally settle the disputes, left the archbishop almost powerless to cope with adversaries. Fearing that by remaining he

EDMUND I.—EDRISI

might seem to sanction what he could not redress, he left the country secretly and went to France, where he received a warm welcome.

He was canonized in 1246, only four years after his death. Some of his works extant are: 'Constitutions,' to be found in 'Editions of the Councils' by Linwood, Spelman, Wilkins, Johnson, and Labbe; 'Speculum Ecclesiæ,' or 'Mirror of the Church'; and several of his works in manuscript, one on the Sacraments, are in the Bodleian library, Oxford. Consult: Wood, 'History and Antiquity'; Tanner, 'Notitia Monastica'; Butler 'Lives of Saints'; Ward, 'His Life, as told by Old English Writers' (1903).

Edmund I., or Eadmund, king of England: b. about 921; d. 26 May 946. He was a son of Edward the Elder and succeeded his brother Athelstan in 940. He subdued Northumbria and the Five Danish Boroughs in 944, and in the following year conquered Cumbria, which he bestowed on Malcolm, king of Scotland, on condition of homage. He was killed at a banquet by Liofa, an outlaw.

Edmunds, George Franklin, American lawyer: b. Richmond, Vt., 1 Feb. 1828. He received a common school education, as well as the instructions of a private tutor; studied law, and began its practice in 1849. In 1851 he removed to Burlington, Vt. He was a member of the Vermont legislature 1854-9, being speaker 1856-9, and was a member of the State Senate, and its president 1861-62. He was by this time very prominent in Vermont politics, and at the opening of the Civil War, when a State convention assembled with the intention of uniting war Democrats and Republicans, he outlined the resolutions which the convention finally adopted as the principles of union. On the death of Solomon Foot, in 1866, Edmunds was elected to the United States Senate to fill Foot's unexpired term, and was thrice re-elected for full terms, resigning in 1891. During his quarter-century in the National Senate he served on many important committees, displaying the qualities of an able, accomplished statesman. He was a member of the electoral commission in 1877, and was the author of the act of 22 March 1882 known as the "Edmunds Act" (q.v.), which provided for the suppression of polygamy in Utah and the disfranchisement of any person convicted of practising it. He was also the author of the "Anti-Trust Law" of 1890. During the term of President Arthur he was president *pro tempore* of the Senate. In 1897 he became chairman of the monetary commission which had been appointed by the executive committee of the Indianapolis monetary conference. Since his retirement from the Senate he has devoted himself to his profession, and has a wide fame as a constitutional lawyer.

Edmund II., or Eadmund (surnamed **Ironside**), king of England: b. about 981; d. 30 Nov. 1016. He was a son of Ethelred II., and on the latter's death in 1016 was chosen king at London, whilst Canute was elected to the same dignity at Southampton. Edmund several times defeated the forces of the Danish ruler, but was himself defeated at Assandun (now Ashington) in Essex. A compromise was then effected, by which the midland and northern counties were assigned to Canute and the southern to Edmund.

Edmunds Act, passed by Congress 22 March 1882; an act to root out polygamy in Utah, not only by direct punishment but by barring out votes, public careers, and official action from polygamists. Mormons held control of the Territory not only through the local offices, but from the fact that all juries were composed of Mormons who would not convict their fellows or admit evidence of polygamy; and the act not only disfranchised but excluded from juries all who either practised polygamy or believed it rightful. The disfranchisement was even more effective, as Utah had woman suffrage, and each polygamous wife was disfranchised also. The act made the living with more than one woman in marital relations a misdemeanor, and several leading Mormons were convicted, including their delegate to Congress; which office, as well as all from justice of the peace to probate judge or sheriff, was made inaccessible to polygamists.

Edom, ʿēdôm, in the New Testament, **IDUMÆA**, in ancient times a country lying to the south of Palestine. The Edomites are said in Genesis to be the descendants of Esau. The Edomites were subdued by King David, and after the separation of the 10 tribes remained subject to the kingdom of Judah till the reign of Jehoram, when they revolted and secured their independence for a time. They were again subdued by Amaziah and again in the reign of Ahaz, recovered their independence, which they maintained till the time of the invasion of Judea by Nebuchadnezzar. They fell under the rule of the Persians, and latterly their fortunes were merged in those of Arabia.

Ed'ed, king of England: d. Frome, England, 23 Nov. 955. He was a son of Edward the Elder, and succeeded to the throne on the murder of his brother, Edmund I., in May 946. He quelled a rebellion of the Northumbrian Danes, and compelled Malcolm, king of Scotland, to renew his homage for his English possessions. Edred died after a reign of nine years, and left the crown to his nephew, Edwy.

Edriophthalmata, ed'ri-of-thäl'ma-ta, a name sometimes used for one of the great divisions of the *Crustacea*, including all those genera which have their eyes sessile, or embedded in the head, and not fixed on a peduncle or stalk, as in the crabs, lobsters, etc. These malacostracous *Crustacea* which were formerly included in this group are now generally called *Arthrostaca*, in which all of the thoracic segments, except the first and sometimes the second, are free from the head.

Ed'risi. See **IDRISI**, **ABU ABDALLAH MOHAMMED**.

Edson, Cyrus, American bacteriologist: b. Albany, N. Y., 8 Sept. 1857; d. 1903. He was graduated at the New York College of Physicians and Surgeons in 1881 and in the following year was appointed a sanitary inspector. In 1893-5 he was health commissioner of New York. He discovered a new treatment for consumption, malaria, and other germ diseases, in 1896, which he named aseptolin. His publications include about 80 papers on medical and sanitary subjects. He was the inventor of many surgical instruments.

DEPARTMENT OF EDUCATION.

Education. *Introductory.*—Responding to the request of the editors of the 'Encyclopedia Americana,' I have seriously endeavored to make (in the necessary limits) as complete a presentation of the growth and present status of popular education in America as practicable. The list of titles is as comprehensive as one would expect to find in any ordinary work exclusively devoted to the subject. A list of other authors who would be welcome in this connection would certainly be a long one, and a few of marked prominence in educational activities are missed with decided regret. But no one who is at all familiar with educational work will be disposed to question the authority, born of experience and accomplishment, which is behind the extended list of titles that has been prepared at my request.

No attempt has been made to develop here anything like a history of educational progress in America. It has been in mind to indicate the present educational situation as clearly as may be in the space permitted, to show the educational organization of the country and the methods of its administration, to suggest the paths which have been heretofore followed, to exploit in some measure the thought which has actuated what has been done, and to do it through men and women whose writings are bound to carry very considerable weight.

With this in mind every branch and grade of the school organization has been treated. All institutions, high and low, whether tax supported, or endowed by private benefactions for the good they may do, or sustained by religious or other interests for the propagation of the same, or only of a proprietary character and operated for private gain, have been considered a part of the school organization of the country. Of course it has not been practicable to include any class of institutions which has not attained some prominence by reason of numbers, of thoroughness of organization, or of distinct and recognized public significance. Special and recent movements in education have been presented, so far as the general purposes of the plan allowed. Educational activities which are wholly outside of the schools have not been passed unnoticed. Libraries, study clubs, public lectures, art movements, instruction by correspondence, work in Christian and other associations, and every organized movement for aiding study or culture outside of the schools have been given such recognition as was practicable.

Educational work in the Dominion of Canada has been presented to some extent. It has come to influence and be influenced by educational work in the United States to an extent which warrants its inclusion. The democracy of learning recognizes no political boundaries, and educational movements in the great Dominion at the north of us—not only because they are coming to interlace with those of the United States, but also because they are often specially instructive—may well have place in any treatment, even in a necessarily brief and summary exposition, of American education.

In the interest of comprehensiveness, Latin-America has not been ignored.

The liberal education of women is rather fully and certainly very capably presented by

those who are wholly familiar with the subject.

The distinct tendency of the present time toward training in manual expertness and business efficiency, for their own sake and for a sane and balanced intellectual quickening, as well as the no less decisive movement toward a mastery of world knowledge upon geography, productivity, transportation, and trade, in the interest of the nation's commercial and intellectual primacy, promise to be more adequately reflected here than in any other single place.

Most of the authors of these educational titles are well known, by name at least, to all students of education. Their names have become familiar by reason of length and eminence of service or by reason of special expertness in the field which they treat. A small number might have a word of introduction or explanation by me without impropriety. But it must suffice to say that no one of them is without the right to speak in such a forum. Every one of them has studied seriously, worked industriously, and succeeded in accomplishing something of decided concern to the educational world. Indeed, there has been some effort to introduce several names which are not yet as well known as they are likely to be.

And is there not considerable ground for gratification that education may have even so extended a treatment as this in an encyclopedia?

The leading articles on educational subjects are as follows: ADULT EDUCATION; AGRICULTURAL EDUCATION; AMERICAN UNIVERSITY, THE; ARCHITECTURE, EDUCATION IN; BLIND, EDUCATION OF THE; CANADA: HIGHER, SECONDARY, PRIMARY, CATHOLIC, AND PUBLIC EDUCATION; CANADIAN UNIVERSITIES; COEDUCATION; COLLEGE, THE AMERICAN; COLLEGES FOR WOMEN; COMMERCIAL EDUCATION; CORRESPONDENCE SCHOOLS; EDUCATION: IN THE UNITED STATES; BOARD OF, UNITED STATES; ELEMENTARY; THE DEVELOPMENT OF THE OFFICE OF SCHOOL SUPERINTENDENT; ENGINEERING; HIGHER, IN THE UNITED STATES; INDUSTRIAL; MILITARY; PROFESSIONAL, IN AMERICA; ROMAN CATHOLIC, IN AMERICA; SCIENTIFIC AND TECHNICAL; SECONDARY; SUPPLEMENTAL: IN LATIN-AMERICA; OF WOMEN; UNITED STATES BUREAU OF; EDUCATIONAL ORGANIZATION AND ADMINISTRATION; ENGINEERING, CIVIL; ENGINEERING, MECHANICAL; HOME EDUCATION; INDIAN, EDUCATION OF THE; KINDERGARTEN, IN AMERICA; LAW, AMERICAN SCHOOLS OF; LIBRARY ADMINISTRATION; MANUAL TRAINING; MEDICAL EDUCATION; NEGRO, EDUCATION OF THE; PAINTING, EDUCATION IN; PARISH SCHOOLS; PUBLIC OR COMMON SCHOOLS; RELIGIOUS EDUCATION; SCHOOL SUPERVISION; SCHOOL SYSTEM, AMERICAN; SCHOOLS, COUNTY TRAINING; SCIENCE OF LANGUAGE; SCULPTURE, EDUCATION IN; STATE UNIVERSITIES, THE; STUDY OF EDUCATION; TECHNICAL EDUCATION; TECHNOLOGY, SCHOOLS OF; TRADE SCHOOLS.

ANDREW S. DRAPER.

Education in the United States. Education in the United States since colonial days has been of irregular growth, but rapid and entirely unhampered. Till late in the first half of the 19th century there was no uniformity in school-room methods or administrative details, but in

EDUCATION

each part of the country instruction of children was governed by the customs and traditions which were derived from the early settlers of that section. Through the storm and stress of colonial days, however, education had come to be regarded as a fundamental principle in the development of the new country, and the same theory which controlled the early development of the States and the nation may be said to apply with equal strength to the growth of the schools, namely, equal opportunities for all citizens and freedom from tradition and precedent. Whether the schools had their origin in New England, where Puritan English ideas predominated, or in New York, where the liberal spirit of the Dutch toward popular education influenced their growth, or in the South, where the influence of wealthy landholders, with continental ideas of education for the few, had been less favorable to popular education, they rapidly acquired an individuality and rugged power which led to an incredibly swift development toward free public instruction when the appointed day arrived. The strength of the American school system has been its unquestioned precedence in the minds of the people over all other matters of administration, its careful nurture on independent bases, and the virility with which the different forms have grown into a related system.

What Education Means.—When we speak of the education of a country we must go much deeper than its courses of study, its methods and its administrative machinery. To thoroughly appreciate the growth of education in the United States we must know the history of the people, their temperament, their traditions, and the spirit of their institutions. Education is the outcome of all these. It is the embodiment of the genius, the aspirations and the compromises of a people. No adequate idea of Greek art or Greek literature could be obtained unless there were known the characteristics of the Greek people, their intense love of freedom, and their passion for physical beauty and development. We must look to historical beginnings. The United States has been particularly fortunate in this respect. They have had no legacy of ignorance and stupidity bequeathed to them from the Middle Ages. The very fact that the settlers of the 17th and 18th centuries must have had keen minds and stout hearts to lead them to brave the dangers of the ocean and the wilderness, precluded the forming of the stolid, inert mass of citizenship which every older civilization inherits.

The United States has never been burdened with blind allegiance to precedent or servility to a creed. Whatever nation of Europe you may choose for an example—whether we take France, or Prussia, which for nearly a century have been engaged upon the problem of education for the masses, or England, which has been engaged upon it for a lesser time, or Russia, which is just making a beginning—they have all had first to penetrate down through the ignorance, the superstition, and even the antipathy to culture developed by centuries of mental apathy. They have had first to awaken a responsive spirit—a problem which the United States has escaped. In fact, our educational policies, like other administrative features, have sprung into being in response to the demands of

the people and the spirit of the times. Education is a broad term and means not only the mechanism of instruction, but the national life outside the schools and that vital intelligence of the people which maintains its institutions and establishes its ideals.

Government Assistance.—The policy of the general government has always been most liberal toward educational matters. The Federal Constitution of 1789, it is true, assumed no powers over public education and in accordance with the theory which had prevailed during colonial days left the matter entirely to the States for regulation. The reason was not that the framers of the Constitution were in any wise indifferent to education,—quite the contrary; but the theory prevailed that the real responsibility and therefore the expense should fall upon the localities legally chargeable with the custody of the children. The policy from the earliest period of the government in the disposal of the lands of the West was to set aside one section in each township for the support of the common schools, and the famous Ordinance of 1787 for the government of the Northwest Territory contained the provision that "religion, morality and knowledge being necessary to good government and the happiness of mankind, schools and the means of education shall forever be encouraged." The total amount of land, according to statistics furnished by the United States Bureau of Education, which has been given to the several States for educational purposes since 1785, amounts to 78,659,439 acres, having an original value of about \$100,000,000. In addition to this immense endowment of public education throughout the country, Congress by the Act of 1887 authorized a perpetual appropriation of \$15,000 per year for each agricultural experiment station connected with a State agricultural college, and under the Act of 1890, \$25,000 per year to each of the colleges themselves. In addition to this, the general government provides for the education of the Indians, and the children of Alaska, and has given many independent grants of land, particularly in the southern and western States, for educational purposes. The aggregate value, according to the commissioner of education, of lands and money given for education in the several States, is nearly \$300,000,000.

In 1867 Congress authorized the establishment of the National Bureau of Education, "for the purpose of collecting such statistics and facts as shall show the condition and progress of education in the several States and Territories, and of diffusing such information respecting the organization and management of school systems and methods of teaching as shall aid the people of the United States in the establishment and maintenance of efficient school systems, and otherwise promote the cause of education throughout the country." The Bureau has no direct control over educational matters within a State, but has exercised a tremendous controlling influence through the value of its statistics, the breadth of its investigations and the public confidence in its recommendations.

A National System.—In view of the complicated growth of education in this country the question has often been asked whether there is a national system of education in the United States, or whether there are 50 independent

EDUCATION

systems, corresponding to the number of States and Territories within our borders. Some doubt might have occurred in answering this question even as late as 20 years ago; but at the present time there is no hesitation in asserting that the United States has a greater unity and similarity in courses of study and methods of administration than exist in any other country of the world, with the exception perhaps of France. This was clearly demonstrated by the educational exhibits of the United States, both at the Paris Exposition of 1900 and at the Saint Louis Exposition of 1904. Had the labels over a portion of the work of Boston and New York been interchanged for those of Denver, Saint Louis or San Francisco, no one not having a knowledge of local touches and coloring could have detected the difference. It was impossible for any person to go from State to State in the educational exhibits at Saint Louis and detect any radical distinction in the work presented or the methods illustrated. Such differences as exist are entirely local in their reasons and are the evidence of the personality of the superintendent or the progressiveness of the community. The fact that there is in this country a truly national system of education has been conceded with some surprise by foreign critics and accepted with a high degree of gratification by the American public. The simultaneous advance in any line of progress of a nation vast in extent and power is an impressive fact. It indicates a flexibility of mind and a solidarity of purpose which would be irresistible applied to any problem. There is the same element of strength in a union of ideas on mental training in every section of a great country as in its physical and constitutional union.

Two reasons seem ready at hand and fully sufficient to account for the fact that 45 States, each under a distinct government in all local matters, separated by climate, tradition and culture, are practically a unit in their educational organization. The first is the influence of the United States Bureau of Education, the second the influence of the National Educational Association. As has been stated, the Bureau of Education can not arbitrarily shape any educational policy. But so wisely has the power of suggestion been used, so forcibly has the inference from statistics been drawn, and so clearly has the comparison of systems, foreign and domestic been set forth, that our educational policies have by force of logic formed in parallel columns. No statement of the influence of the Bureau would be accurate without an acknowledgment of the strong personal influence and acknowledged premiership in all educational matters of the present United States commissioner of education, Dr. William T. Harris.

The second reason, the influence of the National Educational Association, is fully as apparent and one peculiar to this country. Drawing its constituency from every part of the Union, meeting once a year, alternately east and west, in full numbers and twice a year through its Department of Superintendence, there is a constant change of criticism and information which holds in close relation every component factor. No experiment or innovation which has proved a success in the East or the West but has been thoroughly discussed and presented to the representatives of every State

in the Union. The Association has become a clearing house for educational ideas, where what is good is adopted and what is bad is rejected, and where the personal relations entered into by the members of the Association insure the respectful consideration of any ideas submitted. The Association at the present time has between 4,000 and 5,000 active members and about 15,000 associate members. The special investigations under its auspices carried on by the Committee of 15, and the Committee of 10, and their reports which have become almost classic, are the basis of the courses of study now pursued in the elementary and secondary schoolrooms of every State in the Union. As a result of these two great forces public education in the United States is to-day maintained and administered on practically similar lines everywhere throughout the country.

Theory of Education in the United States.—The theory upon which the educational system of the United States has been developed is in distinct contrast to that of European countries. In every State the entire course of construction is articulated so as to form a symmetrical unit. The transitions from the elementary to the high school, from the high school to the college, and from the college to the professional school are made without a break and form a steady progression. A pupil may drop out at the end of the elementary or at the end of the high school or in the middle of the high school course, but he has had the same training as those who go on to the end, and if he returns to his school after an interim of two or three years he can take up his work where he left off, handicapped in no respect but by age. Our policy has been to place the entire sequence of studies under one administrative head, and much of our recent thought has been given to so interrelating the different parts as to put forward the time when a student may become a self-supporter.

In the foreign educational systems, on the contrary, there are two distinct courses of study, both under government control, both classed under public education, and parallel in point of time with each other. The first, usually termed primary education, covers instruction from the ages of 5 to about 15 years and is designed to train children of the masses manually and artistically for the trades in store for them. Its influence is to perpetuate social castes. The course parallel to this is known as secondary instruction and covers the ages from 5 to 18 years, fits pupils for the universities, and embraces a study of the classics and humanities in general. It is designed to lead to the cultural professions. Tuition is charged in all secondary schools.

This radical difference in the theory of administering public instruction must always be borne in mind in comparing the American educational system with that of foreign countries. The United States treats all children alike from their earliest years to the last year or two of the high school course. No discrimination is made, or option given, except those based upon the mental capacity of the pupil. As has been tersely said, every child in the United States is educated in the possibility of one day becoming President of the country. In continental Europe, on the other hand, the average child is destined from infancy to follow

EDUCATION

the occupation of his father and it is only accident that throws him from this rut. His training is highly specialized from his earliest years with this object in view, and while he becomes manually the most expert workman in the world in his own particular craft, he has lost sight of the relations of his trade to every other trade and has never gained that power of initiative essential to the highest success of an individual or of a State. It is firmly believed in this country that the superiority both of American workmen and of American methods, as demonstrated in the remarkable progress made in the commercial and industrial world by the United States during the last quarter-century, is due much more to the liberal training of our public school children till they are 14 or 15 years of age than to an extensive development of any form of special training. First develop the mind on broad, liberal lines so that as a citizen the pupil can grasp all sides of the question, then build on this solid sub-structure the trade, profession or specialty which he is to follow. The conditions in the United States do not require nor do our people demand that there shall be in our courses of study a dominant tendency toward any particular phase of industrial progress. The conditions which govern our growth and development prevent the possibility of a perpetual or hereditary working class. Such a state can exist only in an old and stratified civilization, where all chances of sudden wealth and preferment have been exhausted, and nothing remains for the masses but to attain the highest possible industrial skill in the arts and trades. This is the rock on which every attempt to adopt foreign methods *in toto* in American systems must go to wreck. There is no common basis for adjustment. The differences are fundamental and incident to the different theory which underlies the spirit of popular education in the Old World and the New. A freedom and elasticity is demanded in the educational system of this country to correspond to the possibilities existent in its material development. In making this comparison there is no intention of criticising European educational systems. Facts only are given, and no one can say that the European system is not altogether the best for the social conditions which Europeans have to face. Nothing is more certain, however, that their system is not in accord with the theory of American institutions, and that a system of instruction in this country which tended even in the slightest degree to promote class perpetuity could not stand.

Support of Schools.—The liberal support of education in the United States has been a marked characteristic of its development ever since the great school revival which took place from 1830 to 1845. Prior to this period the establishment of schools had been desultory or without uniform action even in the same State. It consisted mostly in the authorization of detached schools of various grades, each of which was independent in its administration and curriculum. At the period above mentioned, however, the general awakening as to the necessity of organized free public education accessible to every child in the land became a firmly established policy. The influence of great leaders like Horace Mann and Henry Barnard was felt throughout the country and

every one of the States then in existence, and every new State as rapidly as formed, assumed the control of all common school education within its boundaries.

The theory of taxation for the support of the schools was founded upon the principle that all property holders, whose interests would be promoted by an intelligent observance of laws on the part of the public, were liable to taxation for common school purposes whether or not they had children who were receiving the benefits of this instruction. The key note of the popular feeling of the time was forcibly put by Webster in his Plymouth Oration: "For the purpose of public instruction," he said, "we hold every man subject to taxation in proportion to his property, and we look not to the question whether he himself have or have not children to be benefited by the education for which he pays; we regard it as a wise and liberal system of police, by which property, and life, and the peace of society are secured. We seek to prevent, in some measure, the extension of the penal code by inspiring a salutary and conservative principle of virtue and of knowledge in an early age. We hope to excite a feeling of respectability and a sense of character by enlarging the capacities and increasing the sphere of intellectual enjoyment. . . . Knowing that our government rests directly upon the public will, that we may preserve it we endeavor to give a safe and proper direction to the public will. We do not, indeed, expect all men to be philosophers or statesmen; but we confidently trust . . . that by the diffusion of general knowledge, and good and virtuous sentiments, the political fabric may be secure as well against open violence and overthrow as against the slow but sure undermining of licentiousness."

Another mighty force which affected not only the public support of education but also the character of the instruction itself was the intense industrial life and the development of unsettled territory which followed the applications of steam and electricity. For 200 years after the foundation of Harvard higher education had followed the same time-honored curriculum, and so long as it was expected to turn out only lawyers, doctors and preachers it sufficed. But an age of material development was at hand, which has already run over half-a-century, and which reads like the tale of a magician. The population of the country has increased from ten to eighty millions of people; the broad areas of an entire continent have been brought under subjugation; systems of transportation bind every part of this great country in close relation: New York and San Francisco are no farther apart than Boston and Philadelphia at the beginning of the period; the inventions of science in every field of human endeavor are a catalogue of wonders; the growth of applied arts to public service has become a prime consideration. The genius of man seems to have sprung forth fully armed to meet the call of opportunity. All this has demanded a variety of talent and a wealth of special training which the old institutions could not furnish, and higher education has been constantly undergoing changes to meet the demands of commerce and industry. Schools of technology and applied science have sprung up by scores; and the curriculums of the older uni-

EDUCATION

versities have been expanded to furnish the required training. The percentage of students in higher educational institutions has increased at a ratio double the increase of the population. To put the matter briefly it may be said that the colleges, universities, professional and technical schools, whether State supported or privately maintained, have put themselves in closer relations with the people and are aiming to give the highest degree of practical training to their graduates.

The result of this great demand for practically educated men and the result of the general awakening from 1830 to 1850 has led to a liberality both on the part of the States and of the general government in the support of public education which has been unparalleled in history. The establishment of high schools throughout every State in the Union and of state universities in every State west of the Alleghany Mountains—all as a part of the free public school system—are examples of this spirit. The amount expended yearly for public school buildings and school sites has increased at a rapid rate, till in the year 1903 it reached the enormous sum of \$46,289,074. The total amount expended for schools in 1903 was \$251,457,625.

One of the most striking features in the development of American education has been the immense total of private gifts and benefactions to the cause of education. In many instances they are princely in amount and the sum total during the last 10 years alone approximates \$360,000,000. Two great universities, Chicago and Leland Stanford Jr., owe their foundation and growth entirely to the gifts of a patron. In the year 1902-03 an aggregate sum of \$20,378,000 was given and bequeathed to colleges, universities, professional and technical schools. In 1904-5 approximately \$30,000,000 has been given, of which J. D. Rockefeller's gift of \$10,000,000 to the General Education Board is the largest. The year 1901 was the record year for educational gifts. Not less than \$73,000,000 were donated to educational institutions and educational enterprises. Mrs. Stanford led the list with her \$30,500,000 to the Leland Stanford Jr. University; Andrew Carnegie next with a \$10,000,000 endowment for an institution at Washington which shall foster and develop individual research and investigation; Jacob S. Rogers next with his \$5,500,000 to the Metropolitan Museum of Art; in all 25 millions more than was given in 1900 and 10 millions more than in 1899. During the last half-century over a half-billion dollars have been given to promote educational institutions of higher rank.

Kinds of Schools.—Co-ordinate with the development of free public schools, the country has also assumed a most liberal attitude towards the growth and development of private and parochial schools. The schools of the United States at the present time may be classed under two main heads: first, those supported by public tax; second, those maintained at private expense. Under the first are included public kindergartens, elementary and secondary schools, normal schools, State universities, agricultural and mechanical colleges, and experiment stations; under the latter academies, private schools, colleges and universities of independent foundation, and other educational institutions

supported by incomes and endowments from private sources.

The course of instruction in the United States is practically the same in every locality, and consists of eight years of elementary school work, four years of secondary work, four years in a college or university, and four years in a professional school. The usual age of pupils beginning the elementary course is five or six years, bringing the pupil to the beginning of the high school course at the age of 13 or 14. The high school or secondary course is four years in length in nearly all cities and villages throughout the country, and the entire twelve years' instruction is free to every pupil residing in the school district, and in many parts of the country text-books are provided at public cost. There were according to the statistics of 1903, 15,417,148 pupils in the United States attending public elementary schools and 608,412 attending public high schools. At the same time there were in private and parochial schools 1,093,876 taking elementary subjects and 168,223 taking high school subjects.

About four students out of every 100 who enter the elementary schools continue in the high schools. Upon leaving the high school students may have the choice of entering a college of liberal arts having a four year course, a school of technology, leading to the degrees of civil, mechanical or electrical engineer, or of entering directly a professional school. A few of the universities require for entrance to the professional schools, graduation from the arts department of the university or from a college of liberal arts; but in the great majority of cases it is possible to enter upon the study of law, medicine, dentistry or veterinary surgery immediately upon leaving the high school. In spite of this a majority of pupils graduating from the high schools who intend to enter the professions of law or theology take the arts course in a college or university before beginning their study in a professional school. The average age, therefore, of a graduate from a college of liberal arts and from the scientific and technical schools of the country is about 22. The average age of graduates from professional schools who have not taken the A.B. course is the same; and the average age of those who have entered on their professional study after receiving the A.B. degree is 25 or 26. In the professional schools of many universities an allowance is made of one year to the holders of A.B. degrees, and in several universities having medical faculties the first year in the medical school is permitted to count as the last year of the baccalaureate course. In the profession of medicine, particularly, there is a tendency to look with favor upon this combination, inasmuch as the hospital work required of medical students in addition to the work of the professional school brings them to the age of 26 or 27 before they become wage-earners.

The teachers for the public schools are certified under State laws, and are trained in normal schools maintained at State expense, in training schools and classes, and in pedagogical departments of universities. The number of students enrolled in these institutions in 1903 was 88,003. In the cities and villages of nearly every State in the Union professional training is required of all teachers. In the rural districts

EDUCATION

ability to pass the State licensing examinations is sufficient qualification. Boards of education have power to demand any qualifications they see fit in addition to the minimum fixed by the State. In 1903 there were 564,755 teachers employed in all grades of school and higher institutions, of which 403,244 were women.

Other Schools and Educational Agencies.—The special schools for the education of the deaf and dumb, blind and feeble-minded are maintained either at State expense or under the auspices of the departments of charity. The prevailing theory, however, is that the training of children defective in any degree is as much a duty of the State as the training of children possessed of all their normal faculties and is in no sense to be construed as a charity.

The training of the Indians is done at government expense and is directed largely in the line of industrial training in order to make them self-supporting and self-reliant. The education of the negro is carried on at public expense exactly the same as for white children, and in the North where the percentage of colored children is very small they are usually educated in the same school. In the South, however, and in some of the larger cities of the North separate schools are maintained for negro children, but with the same equipment and course of study as for white children.

The agencies through which supplemental education is carried on in the United States are very numerous and with many other special features connected with education in the United States are treated in separate articles. Chief among these, however, may be mentioned summer schools, home education, traveling libraries, evening schools, popular lectures, and extension courses in arts and science.

Illiteracy.—In comparing statistics on this subject with those of other countries due regard must be had for two facts: First, the immense number of unschooled negroes of the South; second, the startling increase of foreign immigration. Both of these conditions are being grappled with heroically and the awakened condition of public sentiment in the South toward the education of the negro as a business and economic proposition is already having great effect. The formation of the Southern Educational Board and the General Education Board with particular reference to this problem is one of the most salutary measures of recent years. For foreign immigrants little can be done except to reach the children, and the public schools of our seaboard cities are the great crucibles wherein the varied elements of Europe's miscellaneous population are melted down, cleansed, and run into the molds of American citizenship. The children of immigrants are loyal and enthusiastic lovers of their country, and the eagerness with which the great majority of immigrants place their children in school and the sacrifices which they make to keep them there are pathetic and instructive. According to the educational statistics of 1903 the percentage of native white illiterates in the United States is 4.9; of foreign white illiterates is 11.5; and of negroes is 47.4.

Tendency of Modern American Education.—The history of education in the United States for the last century has shown it to be eminently practical, and peculiarly responsive to public demand. Its close relation and responsi-

bility to the people preclude its taking any other form. It is not a thing apart from the public and for the benefit of the few as in the days of Egyptian priesthood, but rather is the instrument of the people in shaping the destiny of the country. Given, then, the trend of the development of this country and there follows as its corollary the tendency of its education. The 20th century will be the scene of a struggle for commercial and industrial supremacy. The rivalry of nations has already become intense and their activities are turned toward the thousand-fold phases of commerce and industry, each requiring special training, and each dependent on the flexibility of mind and adaptability to conditions of its followers. The United States has entered this world conflict with all its energy, and the successes it has already gained have startled its competitors. The kind of education, therefore, of value to these changed conditions, and best likely to train our citizens for their future work, will be the kind of education to which our schools will perforce adapt themselves. This falls naturally into three divisions: education for commerce, education for trades and other industries, and education for agriculture. The educational leaders of the country are already busily engaged upon the problem of how to adapt sufficient training in these lines to meet the demands of the age, and not destroy at the same time the balance which has been maintained in our curriculums with the more clearly cultural subjects, the broad and liberal training in which has been the source of our past strength and present power. This must not be sacrificed in the adjustment which must inevitably come, for to do so would be to remove the cornerstone of the edifice.

The education of a democracy determines its duration. We are engaged upon the greatest experiment in popular government the world has ever seen. Our remarkable progress should not blind us to the inherent danger of a republic. The advancing tide of socialism, the destructive doctrines of anarchy, the theories of Utopians, and false principles of government, can only be met by making our general public familiar with true economic principles. To bring economic science within the reach of the masses is the vital problem for a democracy. There is only one machinery that can effectually do this—continuous and extensive drill on the rational principles of political and social economics, during the formative period of the minds of our future citizens, is the only inoculant to protect our body politic. It is an old saying that every artisan philosophizes in his own way; but it is a responsibility that the state may well assume to teach him the right way. The strength and promise of our great country lie in the fact that this may be insisted upon without *lèse majesté* to a ruler, or enmity to a creed.

HOWARD J. ROGERS,
First Assistant Commissioner of Education,
State of New York.

Education, Agricultural. See AGRICULTURAL EDUCATION.

Education Board, General. This board was founded in New York City in February, 1902, and chartered by Congress on 12 Jan. 1903, its object being the promotion of education throughout the United States, without distinction as to

EDUCATION

race, sex, or creed. Beside gifts from several philanthropists, the board received, when chartered, a special gift of \$1,000,000 from John D. Rockefeller for carrying on the work in the southern states. Upon the assurance of the success of this movement, on 30 June 1905 he made an additional gift of \$10,000,000. Robert C. Ogden (q.v.) is president of the board. See GENERAL EDUCATION BOARD.

Education, Commercial. See COMMERCIAL EDUCATION; TRADE SCHOOLS.

Education, Compulsory. Some one has said that America is a country where no one is compelled to do anything. One might say that the democratic temperament is so universal in America that compulsory processes, save for interests that are generally thought to be imperative, are extremely difficult of execution. This difficulty has been met wherever the effort has been made to secure or to enforce laws requiring attendance upon the schools. The cause is not to be attributed to any indifference to the importance of education, for in no land has the public recognition of this been more common or the provision for it been more universal and munificent; the trouble has arisen from the disinclination of legislators and administrative officers to compel the people in anything which is not clearly seen to be vital to the public safety. So marked has this been that practically all efforts to require general and regular attendance at school was left to the officers and teachers until the labor organizations came to their assistance for the purpose of lessening the competitions with adult labor in the shops and the factories as well as for assuring schooling to the children of the wage earners.

It is more than 50 years since school attendance laws were first enacted in this country, but not until very recently have they begun to take form which would make them effective. Commonly they have declared the duty of the citizen to send his children to school and the duty of the State to assure schooling to every child, but they have not fixed the ages within which all children must be in school, they have not required lists of all children in order to know that all are accounted for, they have not given point to the fact that a parent who robs a child of an education merits punishment until he will be glad to perform a parent's and a citizen's duty, and they have not provided officers seriously charged with the execution of attendance laws and punished them for failure to perform their duties.

Public sentiment not only produces statutes, it is produced by them. The common thought of the masses is guided and seasoned by legislative enactments. If those enactments seem rational, if they spring from world experience and are sustained by the opinions of publicists and statesmen they are accepted by the people. If such enactments are executed with steadiness and uniformity they consolidate sentiment and fix the common thought of the country. This process has been going on for many years in other lands less democratic than ours until we are confronted with the serious fact that in many other countries the attendance upon the schools is not only far more general than here, but the necessity of schooling is much more universally recognized by the masses than

here. It is probably the fact that in Germany the law is so exact in its provisions and so uniformly enforced, and has therefore become so universally believed in by the people that in the city of Berlin, with a million and a half of people, there are not at any time ten children out of school when they ought to be there.

A fair beginning has just been made in this direction in the American States. Not only has a substantial advance been made in very recent years in the way of new legislation, but the necessities of the matter are being much more clearly recognized and the principles which must be incorporated in an attendance law to enable it to be effective are much more generally understood.

In the United States, Alabama, Arkansas, Delaware, Florida, Georgia, Maryland (except the city of Baltimore), Mississippi, North Carolina, South Carolina, Tennessee, Texas and Virginia have no school attendance laws whatever.

Thirty-two States have compulsory attendance statutes more or less effective. In practically all of these, children are required to attend school from the age of 7 or 8 to that of 14 or 16, for a portion or the whole of the school year. In Illinois, Indiana, Kansas, Maine, Massachusetts, in the cities but not the rural districts of Michigan, in Minnesota, Montana, New Hampshire, New Jersey, North Dakota, Ohio, Oregon, Pennsylvania and Rhode Island, the attendance within the required ages must be during all the time the schools are in session. In New York it must be for eight months, which is the minimum length of the school year. In Wisconsin the period is eight months in the cities and five months in the rest of the State. In Vermont it is 28 weeks. In California it is five months for which 18 weeks must be consecutive. In Utah it is 20 weeks, of which 10 must be consecutive. In Colorado, Connecticut, Idaho, Iowa, Michigan, outside of the cities, Nebraska, Nevada, South Dakota and Wyoming it is from 12 to 18 weeks. In Kentucky it is eight weeks.

In the States having such laws violations are punished by fines varying from \$5 to \$50 in amount. In California, Indiana, Maine, Michigan, Minnesota, Missouri, New Jersey, New York, Ohio, Pennsylvania, Utah, and Wisconsin the offender may be imprisoned. In New York, Massachusetts, Pennsylvania and Washington the school moneys may be withheld from a city or district which neglects to enforce the law.

The more advanced States are beginning to provide for an enumeration of children of school age in order to supply information as to who should be in school and also for special officers whose duty it is to see that all are accounted for.

A noticeable difference between the compulsory attendance laws in America and in the more advanced European nations is that with us attendance within specified ages is required, while with them the attendance must continue until a specified measure of educational proficiency is proved to the satisfaction of school officers.

There is no doubt of effective attendance laws reducing illiteracy. The comparisons between the European nations themselves as well as between our States and the European na-

EDUCATION

tions are exceedingly interesting; and the comparisons of one American State with another are no less so. In Italy with no law in force the percentage of illiterates above 20 years of age is 52, while in France with an effective law it is less than 5. In Russia with no law it is 61 per cent, while in Holland with a good law it is 2 per cent, and in Sweden and Denmark it is less than 1 per cent. In Spain it is 68 per cent with no law and in England with a stringent law the percentage of illiteracy almost disappears.

Of course other factors than compulsory attendance upon school enter in some degree into the measure of illiteracy in a State, but there can be no doubt about systematic and enforced school requirements being the overwhelming factor. The following figures taken from the United States census of 1900 are conclusive:

Percentage of illiterate voters in States having compulsory attendance laws:

California	6.2
Colorado	4.1
Connecticut	6.8
Idaho	5.4
Illinois	4.8
Indiana	5.6
Iowa	2.7
Kansas	3.4
Kentucky	18.8
Maine	6.4
Massachusetts	6.4
Michigan	5.5
Minnesota	4.1
Missouri	7.0
Montana	6.1
Nebraska	2.5
Nevada	12.8
New Hampshire	7.9
New Jersey	6.9
New York	5.9
North Dakota	5.4
Ohio	4.8
Oregon	4.8
Pennsylvania	7.7
Rhode Island	9.2
South Dakota	5.0
Utah	3.7
Vermont	7.9
Washington	3.4
West Virginia	12.9
Wisconsin	5.5
Wyoming	4.3

Percentage of illiterate voters in States without compulsory attendance laws:

Alabama	33.7
Arkansas	26.0
Delaware	14.0
Florida	22.1
Georgia	31.6
Louisiana	37.6
Maryland	12.5
Mississippi	33.8
North Carolina	29.4
South Carolina	35.1
Tennessee	21.7
Texas	15.4
Virginia	25.3

The States of Kentucky, Nevada, and West Virginia in the first table above may seem exceptional. They are really not so, for their compulsory laws are new or not enforced. Their chief educational officers have officially said, of Kentucky: "In the rural districts the law is almost a nullity." Of Nevada: "The law has never been enforced. It is sometimes used to scare foreigners. As it now stands it is a dead letter. We can not force the legislature to amend it." Of West Virginia: "The law is new and not yet fully developed." The evidence seems conclusive that the sentiment of a State determines the percentage of illiteracy, and the best proof

as well as the necessary instrument of a healthful public sentiment is a compulsory attendance law which compels. There will, of course, be special circumstances, like the presence of large cities, or of a large body of recent immigrants, or of particularly hard economic conditions, but ordinarily it may be safely said, with entire confidence, that a low rate of illiteracy and effective compulsory attendance upon the schools will be found to be companions in the same State.

Much has already been done in Europe to assure the attendance of defective children; that is, the deaf, dumb, blind, etc., while practically nothing has been done in that direction in America. Much provision has been made for them in the more advanced of our States, but their attendance has not been made obligatory to any extent.

It cannot be assumed that all parents wish or are even willing that their children shall go to school. There are parents who are idle and criminal themselves and are without any interest in the well-being of their children and in the welfare of the State. There are parents who are neither idle nor vicious, but who are so lacking in outlook that they will keep their children at work without cause when they should be in school. And there are still other parents whose necessities are real and overcome any interest they may have in the schooling of their children. Of course there are many children who are without parental care and interest.

In all such cases it is the imperative function of the State to intervene and not only see that the child not only has the training which his living in this country gives him as his natural right, but also that he is saved from being a load upon other people, and is prepared to carry his share of the burdens of the State and contribute his share to the prosperity and greatness of the State.

Experience has shown conclusively enough the steps by which, and by which alone, this may be accomplished. Speaking generally they may be enumerated as follows:

1. There must be a registration of all children and of their ages.
2. All within fixed ages must be in school or accounted for.
3. They must be in school at all times when the schools are in session.
4. Absence of children within the attendance limits of age must be for none but imperative reasons satisfactory to the attendance officers, such as sickness or physical disability, or they must be able to satisfy school officers that they are proficient in the work which children within the attendance age may be expected to acquire. Doubtless it would be even better if the only excuse for absence, aside from physical inability, should be proficiency in work rather than the attainment of an age limit.
5. Parents or legal guardians must be held responsible for attendance and neglect must be punished by fine at first and then by imprisonment sufficient to emphasize the seriousness of the offense.
6. Special officers must be charged with the execution of attendance laws. They must operate upon a well ordered system. They must be sufficiently compensated to enable them to be respected and must be vested with powers which will enable them to be regarded. They must

EDUCATION

account for all children within the prescribed ages. They must be authorized to enter shops and factories where children are employed and apprehend employers who violate the school and labor laws. They must co-operate with teachers to reduce truancy to a minimum and they must initiate proceedings to punish parents or guardians who are delinquent.

7. Attendance laws must apply evenly to all parts of the State, country as well as city.

8. Attendance officers must be subject to the direction and discipline of the general officers of the school system.

The uniform habit of having all children in school is somewhat inherent and somewhat dependent upon economic conditions. It is acquirable where it is not common. It will be acquired and become fixed under the steady and persistent requirements of the State. It is imperative to the security of government and the strength of it will measure the true greatness of a people. Illiteracy may be steadily and surely reduced by systematic policy, and the State which has the most heterogeneous or indifferent population and which goes farthest in reducing illiteracy should have the place of highest honor and respect in the American republic.

Compulsory attendance upon American schools is as yet in its earliest stages, but a good start has been made, public sentiment is ripening, and the movement must advance until it covers the land with very considerable uniformity and is enforced with very general effectiveness.

ANDREW S. DRAPER,

Commissioner of Education, State of New York.

Education, Elementary. In all the schools of the United States, public and private, elementary, secondary and higher, there were enrolled in the year 1899-1900 about 17,500,000 pupils. The actual average attendance for each pupil in the public or common schools did not exceed 98 days, although the average length of the school session was 1.446 days.

Out of this entire number deduct the pupils of private and parochial schools of all kinds, elementary, secondary, higher, and schools for art, industry and business, for defective classes and Indians, there remain over 15,300,000 for the public school enrolment, or nearly 90 per cent of the whole. The great growth of public schools in the last 30 years may be gathered from a 60 per cent increase in the cost of common schools, owing to better apparatus and more commodious school buildings, but especially to longer terms and higher salaries to teachers. The effect of the great increase of railways in the same period is to extend the suburbs of cities and vastly increase the urban population. The rural schools in sparsely settled districts still continue their old practice of holding a winter school with a session of 60 to 80 days only, and taught by the makeshift teacher who works at some other employment for two thirds of the year. The school year of ideal length should be about 200 days, or five days per week for 40 weeks, that is, nine and one half months. In the early days of city schools the attempt was made to hold a session of over 46 weeks in length, allowing only six weeks or less for three short vacations. But experience of their advantage to the pupil has led to the increase of the holidays to nearly double the former amount.

The average schooling, it appears from the above showing, amounts to enough to secure for each person a little more than one half of an elementary school course of eight years,— enough to enable the future citizen to read the newspaper, to write fairly well, to count, add, subtract, multiply and divide, and use the simplest fractions. In addition he acquires a little geographical knowledge, so important to enable him to understand the references or allusions in his daily newspaper to places of interest in other parts of the world. But the multiplicity of cheap books and periodicals makes the life of the average citizen a continuation of school to some extent. The transformation of an illiterate population into a population that reads the daily newspaper, and perforce thinks on national and international interests, is thus far the greatest good accomplished by the free public school system of the United States. That this general prevalence of elementary education is accompanied by a comparative neglect of the secondary and higher courses of study is evident from the fact that out of the number of pupils enrolled more than 95 in every 100 are pursuing elementary studies; less than 4 in 100 are in secondary studies in high schools, academies and other institutions; only 1 in 100 (13 in 1,000) is in a college or a school for higher studies.

In considering the reasons for the increase of the length of the term of the elementary school and its adoption of a graded course of study, one comes upon the most important item of improvement that belongs to the recent history of education, namely, the introduction of professionally trained teachers. The first normal school established in the United States was founded at Lexington, Mass., in 1839. The number of public normal schools supported by the State or municipal governments has increased since that year to nearly 200, and there is about an equal number of private normal schools. In 1880 there were 240 normal school students in each 1,000,000 of inhabitants; in 1897 there were 936, or nearly four times as many in each 1,000,000. The professionally educated teacher finds his place in the graded schools, and he continues to improve in skill and efficiency for many years. The advantage of the professionally educated teacher above others is to be found in the fact that he has been trained to observe methods and devices of instruction. The normal school graduate, too, other things being equal, has a better idea than other teachers of the educational value of a branch of study. He knows what points are essential, and what are accidental and subsidiary. He therefore makes his pupils thoroughly acquainted with those strategical positions, and shows him how to conquer all the rest through these.

As it would appear from the statistics given, the rural districts are precluded by their short school terms from securing professional teachers. The corps of teachers in a highly favored city will be able to claim a large percentage of its rank and file as graduates of its municipal training schools—perhaps 50 to 60 per cent; but the cities and villages as a whole in their graded schools cannot as yet show an average of more than one teacher in four who has received the diploma of a normal school. Another important advantage has been named as belonging to the schools of the village or city. They are graded schools, and have a regular

EDUCATION

course of study, uniformity of text-books, and a proper classification of pupils. In the small rural schools some 20 to 50 pupils are brought together under one teacher. Their ages vary from 4 years to 20, and their degree of advancement ranges from beginners up to those who have attended school for 10 or 12 winters, and are now attempting Latin and algebra. It often happens that there is no uniformity of text-books, except perhaps in the spelling-book and reader, each pupil bringing such arithmetic, geography or grammar as his family at home happens to possess. This was the case in the old-time district school—such as existed in 1790, when 29 out of 30 of the population lived in rural districts, and 50 years later when only 1 in 12 lived in a city. As the railroad has caused villages to grow into cities, so it has virtually moved into the city a vast population living near railway stations in the country by giving them the morning newspaper and rapid transportation. In 1890 one third of the population was living in cities of not less than 8,000 inhabitants. But the suburban populations made urban by the railroad swell the city population to one half of the whole nation. Hence the great change now taking place in methods of building school-houses and in organizing schools.

With the growth from the rural to the urban condition of population the method of "individual instruction" has been supplanted by class instruction, which prevails in village and city schools. The individual did not get much instruction under the old plan, for the simple reason that his teacher had only 5 or 10 minutes to examine him on his daily work. In the properly graded school each teacher has two classes, and hears one recite while the other learns a new lesson. Each class is composed of 20 to 30 pupils of nearly the same qualifications as regards the degree of progress made in their studies, and all pupils learn more by a class recitation than by an individual recitation, for in the class each can see the lesson reflected in the minds of his fellow pupils, and understand his teacher's views much better when drawn out in the form of a running commentary on the mistakes of the duller or more indolent pupils. The possibilities of a class recitation are, therefore, very great for efficient instruction in the hands of a teacher who understands his business. From beginning to end, for 30 minutes, the class recitation is a vigorous training in critical alertness. The pupil afterward commences the preparation of his next lesson from the book with what are called new "apperceptive" powers, for he finds himself noticing and comprehending many statements and a still greater number of implications of meaning in his lesson that before had not been seen or even suspected.

It is presupposed that the chief work of the pupil in school is the mastery of text-books containing systematic treatises giving the elements of branches of learning taught in the schools. The evil of memorizing words without understanding their meaning or verifying the statements made in the text-book is incident to this method and is perhaps the most widely prevalent defect in teaching to be found in the schools of the United States. The oral method of Germany escapes this evil almost entirely, but encounters another. The pupil taught by the oral method exclusively is apt to lack power to master

the printed page and get out of it the full meaning: he needs the teacher's aid to explain the technical phrases and careful definitions. The American method of text-book instruction: throws the child upon the printed page and holds him responsible for its mastery. In the hands of a trained teacher the good of the method is obtained and the evil avoided. The pupil is taught to assume a critical attitude toward the statements of the book and to test and verify them, or else disprove them by appeal to other authorities, or to actual experiments.

In the graded school the pupil is held responsible for his work in a way that is impossible in the rural school of sparsely settled districts. Hence the method of investigation, as above described, is found in the city schools rather than in the rural schools. Where the ungraded school makes some attempt at classification of pupils it is obliged to unite into one class say of arithmetic, grammar, or geography, pupils of very different degrees of progress. The consequence is that the most advanced pupils have not enough work assigned them, being held back to the standard of the average. It must be admitted that in many village schools just adopting the system of grading, this evil of holding back the bright pupils and of over-pressure on the dull ones exists, and furnishes just occasion for the criticism which is made against the so-called "machine" character of the American public school. I have dwelt on this somewhat technical matter because of its importance in understanding the most noteworthy improvements in progress in the schools of the United States. Briefly, the population is rapidly becoming urban, the schools are becoming "graded." Here there is division of labor on the part of teachers, one taking only classes just beginning to learn to read and write, another taking the pupils in a higher grade. The inevitable consequence of such division of labor is increase of skill. The complaint urged against the machine character of the modern school is made quite as often against good schools as against poor ones. But the critical-probing method of conducting a recitation is certainly not machine-like in its effects. It arouses in the most powerful manner the activity of the pupil to think and observe for himself. It is admitted that about 50 per cent of the teachers actually teaching in the schools of villages and cities use this poor method. But it is certain that their proportion in the corps of teachers is diminishing, thanks to the two causes already alluded to: first, the multiplication of professional schools for the training of teachers; and second, the employment of educational experts as supervisors of schools.

Another phase of the modern school that more than anything else gives it the appearance of a machine is its discipline, or method of organization and government. In the graded school with 300 to 800 pupils order and discipline are necessary even to the last particular, for the safety of the pupils as well as for the accomplishment of the ends for which the school exists. There must be regularity and punctuality, silence and conformity to order, in coming and going. These things seem at first to be so much waste of energy. But the moment the question of moral training comes to be investigated, the superiority of the education given in the large school is manifest. The pupil is taught to be regular and punctual in his attendance on school

EDUCATION

and in all his movements, not for the sake of the school alone, but for all his relations to his fellow men. He learns to respect the serious business of others. In moving to and fro by a sort of military concert and precision he acquires the impulse to behave in an orderly manner, to stay in his own place and not get in the way of others. Hence he prepares for concerted action,—another important lesson in citizenship, leaving entirely out of account its military significance. With the increase of cities and the growth of great industrial combinations this discipline in the virtues that lie at the basis of concerted action is not merely important, but essential. Precision, accuracy, implicit obedience to the head or directive power, are necessary for the safety of others and for the production of any positive results. The rural school does not fit its pupils for an age of productive industry and emancipation from drudgery by means of machinery, but the city school performs this so well that it reminds some people unpleasantly of a machine.

In the matter of school discipline again the graded school has an advantage over the school of the rural district. A corps of teachers can secure good behavior more efficiently than a single teacher. The system, and its very "mechanism," help this result. In many cities of the largest size in the United States, corporal punishment is seldom resorted to, or is entirely dispensed with, and the discipline of the school seems to improve as a result. The adoption of a plan of building giving each class-teacher a room to herself, in which pupils to the number of 50 or so prepare their lessons under the eye of the same teacher that conducted their recitations makes it possible to manage a school with little or no corporal punishment. That the public schools of cities have worked great and favorable changes to the advantage of civil order cannot be doubted. They have generally broken up the feuds that used to prevail between the people of different precincts. Learning to live without quarreling with school-fellows is an efficient preparation for an orderly and peaceful life with one's neighbors. It is a stronger moral force than the rural school because of its superior training in the social habits named—regularity, punctuality, orderly concerted action and self-restraint.

Even in colonial times as far back as 1642 a compulsory law was enacted in Massachusetts inflicting penalties on parents for the neglect of education.

In the Connecticut colony in 1650 the Massachusetts law was adopted. Amendments were adopted in 1805 and 1821. By a law of 1813 manufacturing establishments were compelled to see that "the children in their employ were taught to read, write and cipher, and that attention was paid to their morals." In 1842 a penalty was attached to a similar law which forbade "the employment of children under the age of 15 years unless they had been instructed at school at least 3 months of the 12 preceding." At the present 30 States, one Territory and the District of Columbia have laws making education compulsory, generally at a public or approved private school. Sixteen States and one Territory do not make education compulsory, although all of these have fully organized systems of schools free to every child of school age of whatever condition. The most general period of required attendance

at school is from 8 to 14 years of age, as is the case in Vermont, District of Columbia, West Virginia, Indiana, Michigan, North Dakota, South Dakota, Nebraska, Kansas, Montana, Colorado, Utah, Nevada, Idaho, Oregon and California. It begins likewise at 8, but is extended to 15 in Maine and Washington, and is from 8 to 16 in New Hampshire, Connecticut, New York, Pennsylvania, Minnesota and New Mexico. The child is required to begin attendance at the earlier age of 7, and continue to 12 in New Jersey, to 13 in Wisconsin, to 14 in Massachusetts, Kentucky and Illinois; to 15 in Rhode Island, and to 16 in Wyoming. In Massachusetts and Connecticut the child is required to attend the full time that the schools are in session; in New York and Rhode Island, also, the full term, with certain exceptions in favor of children employed to work. In Pennsylvania the attendance is required for 70 per cent of the full term; in California for 66 2-3 per cent; for 20 weeks annually in Vermont, New Jersey, Ohio and Utah; 16 weeks annually in Maine, West Virginia, Illinois, Michigan and Nevada; 12 weeks annually in New Hampshire, District of Columbia, Indiana, Wisconsin, Kansas, North Dakota, South Dakota, Nebraska, New Mexico, Idaho, Washington, Oregon; and 8 weeks annually in Kentucky. Massachusetts requires counties, and New York requires cities to maintain truant schools, or provide for their truants in the truant schools of neighboring localities. Illinois requires cities of over 100,000 inhabitants to maintain truant schools. In Rhode Island towns and cities must provide suitable places for the confinement and instruction of habitual truants. Clothing is furnished in case of poverty to enable children to attend school in Vermont, Indiana and Colorado.

In both the central and the western divisions the education of boys and girls in the same schools is common and exceptions rare in the public schools. In the North and South Atlantic divisions many of the older cities continue to educate the girls in separate schools. In newly added suburban schools, however, coeducation is the rule (as in Boston, for example). In the rural districts of the Atlantic divisions north and south, coeducation has always been the custom. Considering the whole country, it may be said that coeducation, or the education of boys and girls in the same classes, is the general practice in the elementary schools of the United States. The cities that present exceptions to this rule are fewer, apparently, than 6 per cent of the total number. In the majority of these cities the separation of boys and girls has arisen from the position or original arrangement of buildings, and is likely to be discontinued under more favorable conditions. Of the 50 principal cities, four, namely, Philadelphia, Newark, Providence, and Atlanta report separation of the sexes in the high schools only: two cities of this class, San Francisco and Wilmington, reported in 1892, separation in all grades above the primary. In six cities, New York, Brooklyn, Boston, Baltimore, Washington and Louisville, both separate and mixed classes are found in all grades. Five cities of the second class, having a population of 8,000 or more, report separation of the sexes in the high schools, and 10 cities of the same group separate classes in other grades. Of cities whose population is less than 8,000, nine report

EDUCATION

separate classes for boys and girls in some grades. Coeducation is the policy in about two thirds of the total number of private schools reporting to this bureau, and in 65 per cent of the colleges and universities.

In connection with this matter of State compulsory laws against neglect of schools it is well to mention the provisions made in the several States prohibiting appropriations of money to aid denominational schools. There are 40 States with constitutional provisions forbidding all, or at least sectarian, diversion of the money raised for the support of education.

1. *Constitutions which prohibit sectarian appropriations.*—California, Colorado, Florida, Georgia, Idaho, Illinois, Indiana, Louisiana, Michigan, Minnesota, Mississippi, Missouri, Montana, New Hampshire, North Dakota, Oregon, South Dakota, Texas, Washington, Wisconsin, Wyoming—21 States.

2. *Constitutions which do not prohibit sectarian appropriations.*—Alabama, Arkansas, Connecticut, Delaware, Iowa, Kansas, Kentucky, Maine, Maryland, Massachusetts, Nebraska, Nevada, New Jersey, New York, North Carolina, Ohio, Pennsylvania, Rhode Island, South Carolina, Tennessee, Vermont, Virginia, West Virginia—23 States.

3. *Constitutions which prohibit any diversion of the school fund.*—Alabama, Arkansas, California, Connecticut, Florida, Georgia, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Montana, Nebraska, Nevada, New Jersey, New York, North Carolina, North Dakota, Ohio, Oregon, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Washington, West Virginia, Virginia, Wisconsin—36 States.

Manual training is by no means a novelty in American schools. Thomas Jefferson recommended it for the students of the University of Virginia, and Benjamin Franklin included it in his plan for an academy in Philadelphia. An active propaganda was carried on in behalf of manual labor in educational institutions for many years, beginning about 1830, and some of our foremost institutions had their origin under its influence. But what is now known as "manual training" is traced to an exhibit of a Russian institution at the Centennial Exposition in 1876. The value of the system of hand training there suggested was recognized by such men as John D. Runkle and C. M. Woodward, who became advocates of the new idea and introduced it into the institutions under their charge. Strong opposition was met among schoolmen for a time, but manual training has steadily grown in popularity, and with its growth it has constantly improved in matter and method, and consequently in usefulness. In 1898 manual training was an essential feature in the public school course of 149 cities. In 359 institutions other than city schools there is training which partakes more or less of the nature of manual training, and which belongs in a general way to the same movement. These institutions embrace almost every class known to American education, and the manual features vary from the purely educational manual training of the Teachers College in New York city to the specific trade instruction of the apprentice schools. In many cases the legislature have taken cognizance of the movement. Massachusetts requires every city of 20,000 in-

habitants to maintain manual training courses in both elementary and high schools. Maine authorizes any city or town to provide instruction in industrial or mechanical drawing to pupils over 15 years of age; industrial training is authorized by general laws in Connecticut, Illinois, Indiana (in cities of over 100,000 population), Maryland, New Jersey, New York, Pennsylvania, Utah, Wisconsin and Wyoming. Congressional appropriations are regularly made for manual training in the District of Columbia; Georgia authorizes county manual labor schools, and in Washington manual training must be taught in each school under the control of the State Normal school. See MANUAL TRAINING.

Kindergartens are authorized by general law in Arizona, California, Colorado, Connecticut, Illinois, Indiana, Iowa, Michigan, New York, Ohio, Oregon, Pennsylvania, Vermont and Wisconsin. Cities also establish kindergartens through powers inherent in their charters. In 1897-8 there were public kindergartens in 189 of the 626 cities of 8,000 population and over. In these 189 cities there were 1,365 separate kindergartens supported by public funds. The number of kindergarten teachers employed in this year was 2,532, and under their care were 95,867 children, 46,577 boys and 49,290 girls. Information was obtained concerning 2,998 private kindergartens in 1897-8 and it is probable that at least 500 others were in existence. The 2,998 private kindergartens had 6,405 teachers and 93,737 pupils. It will be seen that the total number of kindergartens, public and private, was 4,363, with 8,937 teachers and 189,604 pupils. The actual number of pupils enrolled in kindergartens in the United States in 1897-8 must have exceeded 200,000, as these reports were not exhaustive.

Education in the United States is regarded as something organic, and as belonging essentially to our political and social structure. We are making the experiment of self-government, and it has seemed a logical conclusion to all nations of all times that the rulers of the people should have the best education attainable. Then, of course, it follows that the entire people of a democracy should be educated, for they are the rulers. This necessity for education has been felt in all parts of the nation, and the whole subject is reasoned out in many a school report published by city or state. By education we add to the child's experience the experience of the human race. His own experience is necessarily one-sided and shallow; that of the race is thousands of years deep, and it is rounded to fulness. Such deep and rounded experience is what we call wisdom. To prevent the child from making costly mistakes we give him the benefit of seeing the lives of others. The successes and failures of one's fellow men instruct each of us far more than our own experiments. The school attempts to give this wisdom in a systematic manner. It uses the essential means for its work in the shape of text-books, in which the experience of the race is digested and stated in a clear and summary manner, in its several departments, so that a child may understand it. He has a teacher to direct his studies and instruct him in the proper methods of getting out of books the wisdom recorded in them. He is taught first in the primary school how to spell out the words and how to write them himself. Above all, he is taught to understand the meaning of the words. All first use of words reaches only a few of their

EDUCATION

many significations; each word has many meanings and uses, but the child gets at only one meaning, and that the simplest and vaguest, when he begins. His school work is to train him into accuracy and precision in the interpretation of language. He learns gradually to fill each word of the printed page with its proper meaning. He learns to criticise the statements he reads, and to test them in his own experience and by comparison with other records of experience. In other words, the child at school is set to work to enlarge his own puny life by the addition of the best results of other lives. This is the clue to the hopes founded on education. The work of the school produces self-respect, because the pupil makes himself the measure of his fellows and grows to be equal to them spiritually by the mastery of their wisdom. Self-respect is the root of the virtues and the active cause of a career of growth in power to know and power to do. Webster explained the effect of the school as exciting "a feeling of responsibility and a sense of character." Each youth educated in the school has been submitted to a training in the habit of self-control and of obedience to social order. He has become to some extent conscious of two selves; the one his immediate animal impulse, and the second his moral sense of conformity to the order necessary for the harmonious action of all. The statistics of crime confirm the anticipations of the public in regard to the good effects of education. The jails of the country show pretty generally the ratio of 8 to 1 as the quotas of delinquents furnished from a given number of illiterates as compared with an equal number of those who can read and write. And it is found on investigation that the criminals who can read and write are mostly from the ranks bordering on illiteracy. They may be described as *barely* able to read and write, but without training in the use of those arts for acquainting themselves with the experience and wisdom of their fellow men. Thus the political problem, which proposes to secure the general welfare by entrusting the management of the government to representatives chosen by all the people, finds its solution in the establishment of schools for the people.

All who become interested in the system of education prevailing in the United States and see the direct bearing it has on the realization of the ideal of self-government, feel an interest in the question of its origin. Immigrants to America in the colonial period laid stress on the establishment of schools. Education is called "the foundation of the commonwealth," in 1583, in a school law of Holland. At that time there was a stringent school law passed. In Sweden education was common before 1650, and every peasant's child was taught to read. Boston, in 1635, voted a school and funds to support a master. Roxbury was quite active in the founding of free schools. Plymouth, Weymouth, Dorchester, Salem, Cambridge, and other towns had schools before 1650. A law of the general court of Massachusetts decreed that in every town the selectmen should prosecute those who refused to "train their children in learning and labor," and to impose a fine of 20 shillings on those who neglected to teach their children "so much learning as may enable them perfectly to read the English tongue." Schools were established in the Connecticut colonies immediately after their settlement. The Rhode Island

colonies had schools by 1650. Meanwhile in New York the Dutch had brought over their zeal for education. The Dutch West India company, in 1621, charged its colonists to maintain a clergyman and a schoolmaster. It seems that in 1625 the colonial estimate included a clergyman at 1,440 florins, and a schoolmaster at 360 florins. In 1633 the first schoolmaster arrived—Adam Roelandson. His name is revered like that of Ezekiel Cheever and Philemon Purmont, schoolmasters of early Boston. New Jersey established schools as early as 1683, and an example of a permanent school fund is found in an appropriation made that year. In 1693 a law compelled citizens to pay their shares for the maintenance of a school. The original charter given William Penn required that the government of his colony should erect and aid public schools. Within 20 years after its settlement, schools were founded in Philadelphia, and others in towns of that colony.

Most of these schools mentioned were more truly secondary than elementary. See EDUCATION, SECONDARY.

The management of the district (elementary) schools began in most cases with the church and gradually came into the hands of the smallest political subdivision, known as "districts." Each township was divided into districts for school purposes, and for minor political purposes such as repair of the public highways. Each district contained an average of four square miles, with a school-house near the centre of population, usually a little distance from some village, and holding a maximum of 40 or 50 pupils. The school committee employed teachers. The schools held a three-months' session in the winter, and sometimes this was made four months. When the villages began to catch the urban spirit and establish graded schools with a full annual session, there came a demand for a higher order of teacher, the professional teacher, in short. This caused a comparison of ideals; the best enlightened in the community began an agitation of the school question, and supervision was demanded. In Massachusetts, where the urban civilization had made most progress, this agitation resulted in the formation of a state board of education of 1837, and the employment of Horace Mann as its secretary (June, 1837). Boston had been connected with Providence, Worcester and Lowell by railroads before 1835, and in 1842 the first great trunk railroad had been completed through Springfield to Albany, opening to Boston a communication with the great West by the Erie canal and the newly completed railroad from Albany to Buffalo. This was the beginning of the great urban epoch in America that has gone on increasing the power of the city to this day. Horace Mann came to the head of education in Massachusetts just at the beginning of the epoch of railroads and the growth of cities. He attacked with unsparing severity the evils of the schools as they had been. The school district system, introduced into Connecticut in 1701, into Rhode Island about 1750, and into Massachusetts in 1789, was pronounced by him to be the most disastrous feature in the whole history of educational legislation in Massachusetts. Horace Mann extended his criticisms and suggestions to the examination of teachers and their instruction in teachers' institutes; to the improvement of school buildings; the raising of school funds by taxation; the

EDUCATION

creating of a correct public opinion on school questions; the care for vicious youth in appropriate schools. He discarded the hide-bound text-book method of teaching and substituted the oral discussion of the topic in place of the memorizing of the words of the book. He encouraged school libraries and school apparatus. Horace Mann's influence founded the first normal school in the United States at Lexington (afterward moved to Framingham), and a second one founded at Bridgewater in the fall of the same year (1839). Inspired by the example in Massachusetts, Connecticut was aroused by Henry Barnard, who carried through the legislature the act organizing a state board of commissioners, and became himself the first secretary of it (1839). In 1840, Connecticut established a normal school. In 1843, Mr. Barnard went to Rhode Island and assisted in drawing up the state school law under which he became the first commissioner, and labored there six years.

These were the chief fermenting influences in education that worked a wide change in the management of schools in the middle and western States within the past 50 years. Superintendents of city school systems began in 1837 with Buffalo. Providence followed in 1839; New Orleans in 1841; Cleveland in 1844; Baltimore in 1849; Cincinnati in 1850; Boston in 1851; New York, San Francisco and Jersey City in 1852; Newark and Brooklyn in 1853; Chicago and St. Louis in 1854; and finally Philadelphia in 1883. State superintendents began with New York, 1813; New York was followed by 16 of the States before 1850. From 1851 to the Civil War, eight States established the office of State superintendent; since then, 19 other States, including 10 in the South, that had no State systems of education previously. Normal schools in the United States increased from one, beginning in 1839 in Massachusetts, to 138 public and 46 private normal schools in 1889, with an attendance of upwards of 28,000 students preparing for the work of teaching. This would give a total of some 12,000 a year of new teachers to meet the demand. It may be assumed, therefore, that less than one sixth of the supply of new teachers comes from the training schools specially designed to educate teachers. The history of education since the time of Horace Mann is very largely an account of the successive modifications introduced into elementary schools through the direct or indirect influence of the normal school.

W. T. HARRIS,

U. S. Commissioner of Education.

Education, Engineering. One of the most marked features of recent educational history is the increasing attention given to engineering education. Engineering has been defined as the direction and control of the forces of nature for the use and convenience of man; but until comparatively recently there was no systematic attempt to formulate the principles of engineering nor any organized effort to instruct beginners in these principles.

Engineering education, the application of the sciences to the needs of man, in this country has been a growth entirely within the past 100 years. At the beginning of the 19th century organized instruction in engineering was confined to two or three schools on the continent of Europe. The United States Military Academy was founded in 1802, and for about 30

years was the only organized agency for engineering education in America. For three quarters of a century a surprising proportion of the graduates of this institution practised engineering in civil life, not because the education there given was what would now be called engineering instruction, but because it was the best preparation for engineering practice that could then be obtained. At Troy, N. Y., between 1825 and 1835 was established the first institution in the world for giving instruction in engineering not military. In the next 30 years only four engineering schools were founded, of which only two were really entitled to the name engineering. At the close of the Civil War the graduates of the engineering schools, exclusive of West Point, numbered less than 300.

In 1862 Congress passed an act giving to the several States public lands for the benefit of "instruction in the arts and sciences relating to agriculture and the mechanical arts"; and shortly after the close of the Civil War many of our engineering schools were organized under this act. Never was there a movement more timely or more successful than this, since it has resulted in the establishment of 64 technical colleges—at least one in each State and Territory. Fifty of these give instruction in one or more branches of engineering.

At present there are something over 100 institutions claiming to give instruction in engineering, of which nearly 100 give more or less complete courses in one or more branches of engineering. Of these institutions, 67 offer complete courses in civil engineering, 61 in mechanical engineering, 49 in electrical engineering, 21 in mining engineering, 15 in architecture, 2 in naval engineering, and 2 in sanitary engineering. The number of students in these courses has increased with astonishing rapidity in recent years: in 1889 there were 3,043; in 1899, 9,659; in 1900, 11,874; in 1901, 13,753; in 1902, 16,538. The rate of increase is most remarkable; during the first decade above the average annual increase was about 660, while during the last three it is practically 2,300. The increase in the number of students pursuing an engineering course is much greater than the increase in the number of male students pursuing a non-engineering collegiate course; in 13 years the former increased 444 per cent, while the latter increased only 48 per cent. At present the engineering students constitute 21 per cent of the total number of male students pursuing a collegiate course.

But the most significant fact connected with the growth of engineering education is the improvement in the methods employed and in the scope of instruction. The teaching force of the engineering schools has been increased and the material equipment has been extended, thus permitting a radical change in the methods employed and in the scope of the instruction given. The best engineering colleges of America are offering unexcelled opportunities for the acquisition of the fundamentals of an engineering education. Few, if any, Americans now attend European engineering schools, for it is generally conceded that the American schools, in equipment, methods, and scope of instruction, are superior to any European schools—at least for American engineers. German and British engineers quite generally concede the greater ef-

EDUCATION

fectiveness of American methods of engineering instruction, particularly in the use of fully equipped laboratories and shops and in the value of various forms of practical instruction. The curriculum of the engineering college at present consists of about 10 per cent of English or modern foreign language, usually the latter; 30 to 40 per cent of indirect technical studies, as mathematics, physics, and drawing; and 50 to 60 per cent of technical work. Over half of the engineering students are in institutions requiring for entrance the completion of a four-year high-school course, and another quarter require a three-year high-school course.

At the beginning of the specialization of engineering education practising engineers doubted or denied the value of a technical training for young engineers, and distrusted the engineering graduate; but now general managers and chief engineers prefer technical graduates, since they have been trained in scientific methods of working, and have a knowledge of the fundamental principles underlying all engineering practice, and look out upon the world of truth from the viewpoint of a man of science. The national engineering societies now give credit for training in the engineering school toward the requirements for admission to membership, and the most cordial relations now exist between practitioners and the schools of engineering. Within recent years, largely if not mainly through the influence of the technical colleges, engineering has ceased to be traditional and has become scientific; and engineering has come to be recognized as a learned profession.

The wonderful growth of engineering education is of interest to the young man who is trying to choose a lifework; but it is of vastly greater importance to the citizen who is interested in the continued growth and prosperity of the country. For the past few years our newspapers and our magazines have had much to say about our rapidly increasing foreign trade, chiefly in the way of recording its marvelous growth, but with little attention to the factors that make such success possible. Of course, such a result depends upon many elements, among which are: (1) The peculiarities of our national ancestry, which has peopled this country with the brightest minds of all nations; (2) our political constitutions, which make it possible for the humblest to rise to the highest position; (3) the fact that we are a great nation, speaking one language, with no barriers in the way of the freest social and commercial intercourse; (4) our great and varied natural resources of mine, forest, and soil; (5) the high price of labor, which stimulates the introduction of labor-saving machinery; and (6) the general dissemination of education, which made possible the effective use of labor-saving machinery and permitted the nation to profit by the capable and ambitious workers of all classes.

But we have recently entered upon a new phase of national and industrial life. Until now we have been engaged in subduing the great West, in establishing homes, in founding cities, in building railroads. By legislation we barred out foreign competition and preserved the home market for our own products; but now the new land in the West is occupied and there is no longer an outlet in that quarter for our surplus

labor, and our industries have outgrown the home market. If prosperity is to continue in the future as in the past, we must have new markets; and in these markets we must meet the competition of the world. What are the conditions necessary for success in that field? The recent commercial history of Germany and Great Britain is significant.

For many generations Great Britain was pre-eminent in manufactures and in commerce. In 1870 she did one quarter of the world's business, and the English believed that their industrial supremacy was secure; in a single generation they have awakened to the fact that they are rapidly losing ground and in some respects are already third in the race. With Germany the almost exact reverse is true. Thirty years ago she had a comparatively unimportant place in the commercial world, but in a single generation all this has been changed. The power employed in manufacture has increased four times as rapidly as the population, and the tonnage of the ships engaged in foreign trade has increased ten-fold. From 1870 to 1895 German foreign trade increased 42 per cent, while the English increased only 13 per cent; and from 1895 to 1900 German foreign trade increased \$200,000,000, while England's increased only \$30,000,000. Why is it that Germany, with one of the poorest seaboard in the world, with a poor soil and with a dangerous military position, has been able in a single generation to outstrip England—the mistress of the sea and the foremost manufacturing nation of the world?

The recent marvelous industrial development of Germany was coincident with, and dependent upon, the development of industrial education. About 30 years ago Germany reorganized and strengthened her technical schools and established many new ones, until now the provision for technical education is the wonder and admiration of all who know the facts. In the number and equipment of her technical schools Germany leads the world. She is fully alive to the commercial importance of scientific investigation and technical education.

England a few years ago, confident in the superiority of her own manufactures, passed a law that all foreign-made goods should be labeled with the name of the country from which they came. This stamp was intended to be a mark of inferiority; but, to the surprise of the British, the label "Made in Germany" appeared on the highest grade of goods, which the Englishman had assumed to be of home manufacture. England received another shock when she found her street railroads being supplied with electrical apparatus made in America, and when she discovered that her manufacturers were importing American machine tools, and when America obtained the contract for bridges in her African and Indian colonies. After vainly endeavoring to convince herself to the contrary, England is ready to admit that she is being distanced in the industrial and commercial race, because she has not kept alive to the intimate relation between science and industry, and that in neglecting the technical education of her people she has failed to train her industrial army. In these days of sharp competition and small margins, when the entire world is in the market, the nation that most carefully trains its indus-

EDUCATION

trial army will gain industrial supremacy. Of course, there are other factors, as wages, labor unions, and tariff; but not one of them is of such transcendent importance as that training of the individual which enables him to produce the most in the least time and at the smallest cost.

What is the lesson for the United States? It is, that if this country is to extend or maintain its foreign trade it must look carefully to higher education. We already have a goodly number of technical colleges, but in number and equipment they are inferior to those of Germany, although in method they are better adapted to American conditions than would be the German type. Most of our technical schools are in need of additional equipment and more instructors. Technical education in this country was inaugurated about 30 years ago, and the engineering education given now is vastly better than that of 25 years ago; but there is still opportunity for improvement. The one thing necessary is adequate financial support. Technical education, especially engineering education, is very expensive. A large and costly equipment is required, and machines and apparatus wear out or become antiquated and must be replaced by new. Our technical schools need a more generous support, so that they may add to their facilities and extend their courses. Any money given for this purpose is wisely expended, for experience has abundantly proven that money given to technical education is returned many fold in the increased productivity of the nation's industries.

To be most effective, technical education must be practically free. Unless it is so many will be debarred from its privileges, and society will be dependent upon a few workers from a favored class. One of the main reasons why the United States has been so prosperous in the past is that education has been free, and consequently the higher ranks have been continually recruited from the lower. The way should be open that the humblest may rise from the lowest to the very highest rank. Education should not be bestowed as a charity, nor as a means for helping the recipient to earn a livelihood, but because the proper education of the people is the only basis for social security, economic prosperity, and the highest national development. The conclusion almost certainly follows that only the government has the ability to make provision for the adequate technical education of the people. The Federal government and the States, particularly the North Central ones, have made magnificent provisions for technical education; but the numbers seeking it require increased equipment and the change in industrial life demands a higher grade of work.

At present the engineering college is engaged chiefly in giving the rudiments of an engineering education, but it should do more than simply impart elementary instruction. There are numerous scientific and practical subjects that are very much in need of investigation. The practising engineer frequently encounters problems which ought to be investigated experimentally, but it is seldom that he can command the necessary laboratory equipment or find the time for such work. There should be some place where such problems could be sent for solution; and where is a better place than a research laboratory established in

connection with a technical school? Much of the equipment required in the work of instruction could also be used in research work. The professors now do more or less such work, but they are usually, and rightly, employed because of their ability to teach, and the impartation of instruction consumes so much of their time and energy that they can not do much in the way of investigation. There should be trained corps of men engaged in original research in matters relating to engineering and manufactures, much as is the case with agricultural experiments and investigations now being carried on at most agricultural colleges. Many such investigations are returning to the public each year benefits equal to more than a hundred times their cost. Of these a few are: the breeding of cotton and of corn, the prevention of smut in oats, and the spraying of apple trees for the destruction of harmful insects. Why should not similar aid be given to our manufacturing interests?

The following are the words of a prominent practising engineer: "The cost of duplicating the land, buildings, equipment, and endowment of the largest and most complete technical school in the United States, training more than 1,500 young men, is little more than half the cost of one of the latest battleships, and the running expenses of one of the largest technical schools are about the same as for keeping a battleship in commission. The technical school has a use no less important than the battleship in the 'first line of national defense.' The time has already come when the commonwealth and the nation should contribute more liberally to the burden of its support and help it to ever broader usefulness. The demonstration of its great value to the prosperity of the state is already complete. With the increasing numbers of students and with the rapidly increasing cost of laboratory facilities needed for the best training, the need of funds is greater than private munificence can be relied upon to meet. In the re-awakening of the old spirit of commercial adventure in foreign lands, we must to-day base our hope of success on superior excellence and economy of manufacture and in the calling of our engineers to foreign lands. The growth of our cities is laying a burden of new and larger problems on our departments of public works, a burden which only those trained in the schools of engineering can carry wisely and well. The business man, when he comes to see these matters clearly, will urge again and again a generous support to schools of engineering by city, state, and nation when private munificence fails short."

IRA O. BAKER, C. E.,
Professor of Civil Engineering, University of Illinois.

Education, Higher, in the United States. The beginnings of higher education in the United States are almost coincident with the founding and permanent settlement of the colonies which later became the commonwealths. The General Court of Massachusetts as early as 1630, when the colonists it would seem could have been excused of all concern save for subsistence and safety, agreed to give out of the common treasury £400 "toward a school or college." This worthy purpose and pledge had virtual redemption a few years later when John Harvard's bequest begot other gifts and led to

EDUCATION

the successful establishment of a college which has kept the primacy through the more than two and a half centuries since. The College of William and Mary was founded as a "place of universal study" before the Virginia colony had a population beyond that of a sizable city in the present century, and while all the tobacco the colonists could raise was needed in the judgment of Crown officials for better purposes. Yale received in 1702 its charter, after several unsuccessful attempts covering nearly a half century had been made to establish a college in the Connecticut colony, and leading for a decade or more a migratory existence along the shores of that colony at last found a permanent home in New Haven. The New Jersey Log College lived long enough to prove the practicability, as well as to reflect the need, of a college in that colony, and it was not long after its end which came with the death of its president, who was its faculty as well, that Princeton University came into being as the College of New Jersey in the year 1748. This famous institution had official offspring in Brown University in the colony of Rhode Island, which was organized in 1764 under the agency and presidency of a Princeton graduate acting for the Philadelphia Baptist Association. Pennsylvania had in 1751 her Academy, established under the incentive of Benjamin Franklin, since become the University of Pennsylvania. And in New York but a little later the work of King's College, now Columbia University, was begun, under a charter granted by George II. in the vestry room of Trinity Church, assisted thereto, as were others, by the proceeds of a "public lottery," and with a faculty which for years did not exceed three. These, with Rutgers and Dartmouth, also established in the pre-Revolutionary period, show how general and how deep was the interest in higher education in those primitive and formative days.

The Revolution interrupted the sessions of all of these save one or two for a time, but the occasion of the suspension gave them added reason for existence. Harvard's halls were yielded for a time to the use of the provincial troops and Washington occupied the president's house as his headquarters; Yale had to resume its migratory life again for a season; Nassau Hall, at Princeton, gave shelter by turn to the British and American troops and bears still the scars of the war; the College of Philadelphia had to suspend its work; Brown's University Hall was used as barracks and hospital; the one building of King's College was also put to the latter use for a time; and Queen's College, now Rutgers, fled to the north branch of the Raritan to escape the scenes of active hostilities. William and Mary and Dartmouth seem alone to have continued undisturbed in their work, but the latter lost its Indian students. They all, however, survived the hardships and distresses of that period and others to the number of 13 were added before the century went out, among them Williams, Bowdoin, Union, and Middlebury.

Though all were organized and maintained as private institutions, most if not all of them had material aid from the colonial or the home government either through direct gift of money from the common treasury, through appropriation of lands to their use and benefit by act of the sovereign or the local legislature, through cer-

tain special exemption from some tax or burden, or through the enjoyment of some special privilege, as, for example, the income from a lottery or an excise tax. The entire sum of gifts and privileges now seems exceedingly small. It is estimated by Dexter, in his 'History of Education in the United States,' that the total property of the colleges in existence at the end of the 18th century did not exceed \$1,000,000 in value. As there were between 1,000 and 2,000 students in attendance the per capita provision was somewhere between \$500 and \$1,000. At present with a total over 300 times as great, the per capita amount is nearly \$4,000.

The equipment then deemed essential and adequate was very slight. When the State of New Jersey sought to make good the material losses of Princeton during the war in the scattering of its library, the destruction of its apparatus and the damage to its buildings, the appropriation made was £600 a year for three years, and doubtless the destruction of apparatus was but a very small item of this meagre total. Books were about the only accessories the teacher had in his labors of instruction. It was John Harvard's library and the few volumes which, according to tradition, were carried to the conference at Branford, that were the first tangible equipment of Harvard and Yale. Then came the president, the forbear of that species of executive peculiar to this country, who was in those days always a minister. He filled in his own person the offices of dean, registrar, and college preacher as well as president, and was for some years in one or two colleges the entire faculty, teaching all the subjects of the curriculum; and in others he was the major part. When the buildings were provided as bodies for these ardent spirits, they were of the severest, simplest type, and void of adornment. Nassau Hall, the largest building of its time in the colonies, though plain in its present environment, had the distinction in the advertisements of its earlier days as being of "gentle workmanship." Yet relatively slight and simple as it all was by comparison with the present provision—and by comparison with the results—it represented an intenser interest and appreciation of the importance of this higher training that is even now generally felt. So deep was the concern that the teaching in these institutions was watched with jealousy and, as the democratic spirit grew in strength, with a feeling that they were not fully meeting the need of the whole people. This feeling manifested itself in the effort made in several of the commonwealths to bring the colleges immediately under public control. In some instances the legislature vainly sought by gift to secure this control. In three States, at least, the colleges were for a brief period converted into public institutions. But they all soon reverted to their original character. This period of vexation is remembered generally only in the famous case of Dartmouth College, Daniel Webster appearing in defense of this small college and in opposition to its supplanting by a State university. But what the solicitous public could not bring about in institutions already established and of fixed traditions it was able to provide for in the States where private and church benefactions had not yet laid their foundations. The first steps in this direction

EDUCATION

were taken in the South before the end of the century; and so determined was the purpose of democracy even in those days of penury to insure to all the advantages of the higher education beyond the restriction of any denominational or partisan lines that provision was made in the constitutions of most of the new States for the establishment of State colleges, or "universities," as they came to be called, to be the crown of the public school system. As a result practically every State of the South and every State west of the Alleghany Mountains has its State university supported out of the public treasury and governed by a board of public appointment or election. In 1900 nearly 25 per cent of the total amount expended in support of higher education in the United States was contributed directly by the State, municipal, and Federal governments (Harris), and in 1903 33 States—Alabama, Arkansas, California, Colorado, Georgia, Idaho, Illinois, Indiana, Iowa, Kansas, Louisiana, Maine, Michigan, Minnesota, Mississippi, Missouri, Montana, Nebraska, Nevada, North Carolina, North Dakota, Ohio, Oregon, South Carolina, South Dakota, Tennessee, Texas, Utah, Virginia, Washington, West Virginia, Wisconsin, and Wyoming—and three Territories—Arizona, New Mexico, and Oklahoma—maintained State or Territorial universities wholly or in part at public expense (Dexter). The total attendance exceeded 40,000 in 1903, which was nearly half the total number of students in all the colleges and universities of the United States for the same year, excluding colleges for women alone.

Those States which were carved out of the public domain were to be helped to the fulfillment of this high purpose and constitutional pledge by the grants of land that were made or set apart when the States were formed, and about half their number had in 1862 struggling colleges, bearing the name of university as a rule, but doing work that would now be reckoned as hardly beyond that of a secondary school. The Morrill Act of the year just named initiated a new period. This act provided that for each representative and senator in the Federal Congress there should be appropriated in support of a higher institution of learning in each State 30,000 acres of land, and further that at these institutions technical and agricultural branches should be taught. The effect of this generous grant was to stimulate the State universities in their growth and to broaden the scope of the college curriculum. Sixty-five colleges (Harris) enjoyed the benefit of this Federal endowment. In some States new institutions were created of college grade in which the branches named were to be taught. Dexter lists the Universities of California, Illinois, Maine, Minnesota, Nebraska, Nevada, Ohio, West Virginia, and Wyoming as owing their origin to the Morrill Act. In other States agricultural colleges were established, as in Massachusetts, Michigan, and Iowa; and in still others the proceeds of these grants were devoted to the maintenance of departments in connection with existing institutions. Practically every State has now availed of this Federal gift in provision that has amply justified the grant.

The most gratifying outcome has been the development of the State university to which

in many States, as noted above, these grants have given either life or succor. The grants themselves were not large compared with the annual appropriations now made by the States, but they afforded a nucleus-fund in some and in others a helpful incentive. Taking these grants and making enthusiastic and praiseworthy supplement, "the newer States had the most comprehensive university foundation the world has ever seen" (Draper). They have been supported with good-will and increasing generosity. The annual appropriations to each of several exceeds \$500,000 for current expenses. In some States the proceeds of a permanent "mill-tax" assures a fixed minimum of income. In some of the States no fee is exacted of students coming from within the State; in none is the fee more than nominal except for the professional courses. Occasionally there has been unjustifiable restraint of "academic freedom" or political interference, but happily these instances are rare and with the increasing strength and prestige of these institutions the perils of such restraint or trespass will undoubtedly be lessened. The standards of scholarship of a few are very high and of all probably as high as they would be under private guidance and maintenance. There is doubtless a more ready response in the curricula of these institutions to the demands of the practical, and there seems to be a more widely and deeply pervading sense of the obligation to put the higher training at the service of the public.

Direct Federal aid to higher education is stated in Commissioner Harris's report for 1903 to be but 4 per cent of the total receipts from all sources, though as just stated the grants of land and scrip were effective materially and morally beyond the intrinsic value of such amounts to-day. In addition to such indirect assistance, proffered through the States, the nation maintains its own military and naval colleges, or "academies," as they are called, though organized and conducted on the footing of the best technical colleges here or abroad. The military academy at West Point and the naval academy at Annapolis provide each for the education of one student from each congressional district, Territory, and the District of Columbia, of one each for every senator and 40 upon appointment of the President of the United States.

There is one other type of public college that has illustration in our educational history, the college of municipal maintenance and control under a general State supervision. The most conspicuous and in a sense the only pure example of this type is the College of the City of New York. It was organized as an "Academy or College" in 1847, but has recently been developed into an institution of collegiate standards. The city of New York has within the last few years appropriated nearly \$6,000,000 for new buildings, grounds, and equipment, and appropriates annually over \$300,000 for its maintenance. The city of Cincinnati partially supports an institution of college grade with which professional schools are associated. This university had its origin and still receives a considerable income from private benefactions.

But while the development of the State colleges or universities has been rapid in the last quarter of a century and they have grown to

EDUCATION

such proportions as to embrace in their census (those receiving only partial support from the State, as some of the universities of the South being reckoned in this list) nearly half the total student population in our higher institutions of learning, the colleges, and universities of private origin and nourishing have steadily grown in number and endowments throughout the century. Seventy per cent of all higher educational institutions are (Harris, 'Report for 1903') under control of religious denominations and the remaining 30 per cent, that are non-sectarian, are equally divided in their source of support and control between the public and private. Undoubtedly this denominational control is in most instances merely nominal and indicates the origin of the institution rather than the present supervision or support, for many of the institutions of earlier foundation were designed primarily to prepare young men for the ministry but do not now differ from other colleges in their purposes, their curricula, or general clientele. However this may be, the number of private institutions of this higher and highest grade would seem to be 85 per cent of the total number of colleges and universities, though they have hardly more than half the total number of students. That the interest in the maintenance of private institutions does not wane in spite of the generous public provision is witnessed by the fact that the benefactions of individuals in the decade at the close of the century amounting to \$115,500,000 (Harris, 'Report of 1903') were equal to the sum of the estimated value of college grounds, etc., and of all the productive funds in 1890. Two gifts this current year, one of \$10,000,000 in endowment of a pension system, and the other of like amount for the direct support of colleges and universities, alone maintain the ratio of increase.

The two classes of institutions have thus developed side by side. The private institution has led the way, advertised and stimulated the need and showed how to meet it. The public college or university has followed, under the compulsion of an appreciation of the vital necessity of such training especially for a self-governing people, and of the obligation of a wider need than was met even by the high motive of private provision, has broadened the scope and emphasized the serviceableness of the higher education, has modified or supplemented the somewhat straitened college curricula, and has given a new and noble function to the State. Each now corrects the shortcomings, the excesses, the errors of the other with the result that the expressions of purpose and methods of governance and teaching grow each more like the other into a common type with one aim. For both are public institutions in motive, in object, and in service, but it cannot be doubted that the more general good has been emphasized through the agency of the public university. The institution endowed by private philanthropy has often greater freedom of experiment, is likely to be less influenced by the whim of the hour good or bad, and is more prone to keep the spirit of altruism in its teaching body. Together they furnish an example and proof of high-mindedness, discernment, and prescience as well as of self-sacrifice which promise well for democracy.

That the provision which has been made from these two sources has not been extravagant is evidenced by the fact that the endowment and equipment of no institution yet exceed the need which confronts it. No college or university, public or private, finds itself fully equipped to meet the demand made upon it. Great as the public gifts and private benefactions have been they have not gone beyond the mark of adequacy. The proportion of university-bred men in the early New England settlements was 1 in every 250 inhabitants. The proportion is not now as high throughout the United States, but in the 30 years 1872-1902 the numbers grew from 1 in 1,694 inhabitants to 1 in 731. This is accounted for in part by the greatly increased number of women students. This total includes, however, only the women in coeducational institutions (somewhat more than 20,000 in 1902). The doors of men's colleges were first opened to women at Oberlin in 1833 and now 72 per cent of the higher educational institutions are coeducational (Harris), including all the State universities save two or three in the South.

The American college was fashioned after the pattern of the English college, but its development has been such as to make it a type of educational institution peculiar to this country. Requiring for admission to its lower class what is now provided by the free public school system in practically all the States of the Union — through an elementary course of eight years and a secondary school course of four usually — it has without important exceptions, until recently, demanded for graduation four years of residence and the completion by all of a uniform prescribed programme of studies of much the same content and scope in all the colleges. Gradually with the increasing knowledges and the diversity of view as to their importance and their relative disciplinary or pedagogical values, students were allowed to make election of some of their subjects, especially in the later years of their courses. So elastic have the requirements now become that in some institutions practically free election is given in all the years of the curriculum, while in many others, in most indeed of the colleges and universities of highest rank, more than half the courses are elective.

And with this elasticity of course there has come an elasticity in time, though this is by no means as prevalent. The requirement at first was residence, there being no uniform requirements of admission. Gradually the latter became fixed, and with term of residence there came to be associated a minimum proficiency test. Now there is a tendency manifest to interpret the requirement not in time but in accomplishment under certain restrictions as to the maximum and minimum amount of work that may be taken in any one term or year. In Harvard University many students now accumulate the credits required for the degree in three years. In Columbia University and a few other institutions the undergraduate course is reduced to three years for those who enter one of the professional schools of the university. It should be noted that the requirements for admission have not only become measurably uniform but they have also been raised far beyond the level of requirements in the early

EDUCATION

days. This heightened requirement prevents the admission of the student to college as a rule under the age of 18, and since, if he enter a profession, he must spend three or five years in special preparation, he cannot normally take his professional degree under 26 there is continuous and increasing pressure from above to shorten or to condense the college course. There are some indications of fission at the end of the sophomore year, corresponding to that which has been made in the German school system, the advanced high schools or "institutes" carrying to that point and the university admitted with that preparation to the graduate or professional school. If this tendency were to become general it would destroy the integrity of the American college and its function as maintained in the past and perhaps eliminate the bachelor's degree.

The development of our universities after the pattern of the continental universities gives some ground for the fear or hope, as the case may be, of this reclassification. Until 25 or 30 years ago little graduate work was offered in this country. In the early seventies there were not more than 200 or 300 graduate students and they were doubtless on their way to the more modest second degree and not to the doctorate. The degree Ph.D. had been conferred in but few instances up to that date. There were a quarter of a century later, in 1900-1, over 6,000 graduate students and over 250 doctorates were conferred at the end of that year. These were all in the courses of academic character.

A comparison with the continental European universities reveals the lack in most of ours of the theological faculty, the comparatively undeveloped state of the philosophical faculty (the latter dividing its time between graduates and undergraduates), and the dominance here of the professional and technical school (Perry). The absence of the first faculty, so conspicuous in the old European universities, is due of course to the divorcement in this country of church and state. That the graduate schools are only now coming into strength, and even yet lack as a rule that character which can only come from the creation of a faculty devoting its full energies to graduates exclusively, is due to our youth and immaturity. The rapid development of professional and technical schools has had its motive in the pressing need of the practitioner.

Concerning the professional and technical schools, it is possible to say here but a word. Law schools did not exist in any number until the middle of the century; there are now approximately 100 such schools, with an attendance of between 10,000 and 15,000 students. The requirements for admission vary from a common school education to a college degree, and the range in length from one year to four years. Medical schools were of much earlier organization, two such having been established in the 18th century in connection with colleges. Their number is now about 150 and the total attendance over 25,000. There is as wide variance in the requirements for admission as in the law schools, but there is practical uniformity in the length of course, four years being required in practically all. Nearly 50 colleges and universities have established and maintain theological faculties. The total number of theological schools in 1902 was 150 (Dexter), and the num-

ber of students 7,343, a decrease, as compared with the attendance of 1900. Nearly half require a college degree for admission, and the length of course in a great majority is three years. In addition to these professional schools, there are over 50 schools of dentistry, with over 8,000 students, 60 schools of pharmacy, with about 4,500 students, and, of comparatively recent establishment, training schools for nurses (Dexter).

The latter half of the 19th century has witnessed also the development of the school of applied science. Most of these schools, whether agricultural or technological, require four years of residence, and grant degrees of like value with the baccalaureate degrees granted by the classical institutions. As stated above, the schools of this type had distinct stimulus from the grants of the Morrill Act.

There remain of the institutions within the higher educational group the schools for the training of teachers.

Nearly 150 normal schools are in existence, but in only a few of the States are the requirements for admission such as to permit the inclusion of these institutions in this class. Besides these there are over 100 private normal schools with nearly 25,000 students; training schools for teachers maintained by several cities; pedagogical departments now organized in many universities and colleges; and a few teachers' colleges.

Higher educational provision in the United States is creditable to a people of so brief a history and under such material obligation and temptation. The college and university, public opinion supporting, have increased their demands quantitatively in spite of the pressure of the "practical," though they have made concessions to the latter. They have enlarged their field of service from preparing at first chiefly for the ministry and then for the learned professions only, until now they include all high human activities in the contemplation of their curricula. They reflect the high purposes of a democratic people; but they are in a good measure responsible for those purposes.

I have been aided in the preparation of this sketch chiefly by Commissioner Harris' reports, Edwin Grant Dexter's 'History of Education in the United States,' and President Butler's 'Education in the United States.'

JOHN H. FINLEY,

President College City of New York.

Education — the Development of the Office of School Superintendent. Supervision of schools by educational experts is an American idea. In ancient Athens, it is true, the teachers were to some extent under the supervision of the State. Overseers were appointed to enforce the laws respecting morality. The State, however, exercised but little supervision over the qualifications of tutors or their methods of teaching. Charlemagne visited the school of the palace and placed the schools for the education of the clergy under the care of the bishops and the parish schools under the care of the priests. They had so many other duties that they could not exercise a close oversight over the teaching in the schools which were thus placed under their care. Luther and Melancthon visited schools and churches under the direction of the

EDUCATION

Elector of Saxony, but their time and strength were devoted to duties other than those of supervision. When the King of England and the nobility made liberal subscriptions for the establishment of a system of charity schools, in which the German children of Pennsylvania might be taught English, and thus through the instrumentality of language be attached to the English Crown, Rev. Michael Schlatter was in 1754 made superintendent of those schools at an annual salary of £100. He was succeeded by Dr. William Smith, who was outspoken in his loyalty to the British government. The former was a missionary of the Reformed Church, and the latter was provost of the university. Hence neither of them could devote much time to the work of supervising the schools under their care.

City Supervision.—The idea of appointing a person who was to devote all his time to school supervision first took shape in Buffalo, N. Y., and Louisville, Ky. In the winter of 1836-7 a law was passed by the legislature of New York authorizing the appointment of a superintendent of common schools in Buffalo. R. W. Haskins received notice of his appointment on Jan. 10, 1837. He accepted the office, but finding the law defective, he resigned before the expiration of the year, and was succeeded by Oliver G. Steele, who has always been known as the father of the public schools of Buffalo.

The city of Louisville, Ky., appointed a superintendent of schools in 1837. He was called Agent of the Board of School Visitors and began his work in the month of September. Two years later Saint Louis, Mo., and Providence, R. I., appointed superintendents. The last of the great cities to create the office of superintendent was Philadelphia.

State Administration and Supervision.—New York also led the way at a still earlier date in provisions for State administration and supervision of schools. The law of 1795, which appropriated for school purposes \$100,000 each year for five years, provided for the annual election of not less than three, nor more than seven, commissioners in each town who were to supervise and direct the schools. By the act of 1787 the regents were empowered to charter colleges and incorporate academies, and to exercise supervision over them, being authorized and required to visit and inspect them, to examine into the condition of education and discipline in them, and to make an annual report thereof to the legislature.

On 14 Jan. 1813 Gideon Hawley was elected superintendent of common schools of New York and retained the office until 22 Feb. 1821, meanwhile having been appointed secretary of the board of regents, 25 March 1814, and continuing in that capacity until 1841. When he was removed by the "Counsel of Appointment" just prior to the expiration of its own life, as provided by the Constitution of 1821, public indignation rose to such a pitch that the legislature promptly abolished the office of superintendent and devolved the duties upon the secretary of state. But the office has been continuous from 1812 to the present time and has been held by several of the most distinguished men of the State.

Maryland had a State superintendent in 1825, and Vermont in 1827, but in neither was the

office continuous. In Pennsylvania the duties of State school administration were, in imitation of New York, devolved upon the secretary of the commonwealth, and Thomas H. Burrows achieved lasting fame by his work for the common schools while serving as secretary of the commonwealth. Most of the time, however, the function of school administration was assigned to a clerk or deputy until 1857 when the office became independent of and co-ordinate with the other departments of the State government. Michigan created the office in 1836, and Massachusetts in 1837 with Horace Mann under the title of secretary of the state board of education. Kentucky came next (also in 1837), and then Connecticut with Henry Barnard under the same title as that adopted in Massachusetts. His office was abolished in 1842, but resumed by himself in 1849. Since that time the establishment of the office has been rapid, and in the newer States the office dates from the beginning of their organization, either as a Territory or as a State.

County and Local Supervision.—In 1841 New York passed a law for the appointment, by the board of supervisors of each county, of a deputy state superintendent of common schools for the county, except that in counties having more than 200 school districts they were to appoint two deputies. These deputies came to be known very soon as county superintendents, and the arrangement lasted until 1847. In 1843 provision was made for the election of town superintendents and this lasted till 1856. In 1854 a State Department of Public Instruction was again established, and the office of superintendent of public instruction was created. In 1904 the Department of Public Instruction and the Board of Regents were consolidated, and at the head was placed a state commissioner of education. The powers lodged in this department of the State government have been surprisingly large. Its decisions can not be questioned and reviewed in any court or in any other place. Thus school disputes can be settled promptly and without much expense.

In Massachusetts there have been several great epochs in the development of the policy of school supervision. The ordinance of 1647 obliged all towns of a given number of householders to provide and support schools. The law of 1789 authorized the employment of a school committee to look after the schools. In 1826 such oversight was made obligatory by law. The people of Massachusetts have always been jealous of their rights and correspondingly slow to delegate power to persons in office. The high-water mark of democracy and the low-water mark of the Massachusetts school system was reached when prudential committees and district committees began to be in collision or collusion. The law of evolution under which the people gradually demand the best in education for their children brought on the period of supervision by experts. At first school committees appointed one of their own number to inspect the schools. The school committee of Cambridge in 1836 and of Gloucester in 1850 delegated to one of their members certain supervisory duties and designated him superintendent of schools. The first instance of the appointment of a superintendent other than that of a

EDUCATION

member of the school committee in Massachusetts was in Springfield in 1840. He remained in office but two years. The first permanent appointment of such an official was made in Boston in 1851. The experiment was successful, and in 1854 a law was passed (amended in 1857 and 1860) authorizing towns and city councils to require the school committee to appoint a superintendent who should have the care and supervision of the public schools. The cities and large towns, one after another, adopted the plan until in 1879, 25 years after the permissive bill was passed, 35 cities and towns employed superintendents for full or nearly full time. In 1888 a law was passed permitting the employment of a superintendent by two or more towns, the expense therefor being largely borne by the State. Permissive measures were followed by mandatory laws, and the legislature of 1900 passed an act obliging the school committees of all towns and cities to employ a superintendent of schools after 1 July 1902, the towns having a valuation of less than \$2,500,000 to be governed by the law under which two or more districts could join in the employment of a superintendent. New York and Massachusetts are typical States, and their example was followed elsewhere, especially in the Northwestern States and in Pennsylvania. In the latter State the office of county superintendent was created in 1854. Popular indignation rose to so high a pitch over the creation of so many new offices that it helped to defeat Governor Bigler when he came up for re-election. But his successor, Governor Pollock, took a bold stand in favor of school supervision, and the superintendent of schools whom he appointed, Henry C. Hickok, made it his chief aim to show the people that they would get more in return for their school taxes if the schools were placed under the supervision of men fitted for the office by literary and professional qualifications. The law in Pennsylvania has always been a schoolmaster of public opinion, and in no long time the advantages of school supervision were recognized, and the policy of electing county superintendents at a triennial convention of school directors specially called for the purpose has remained unchanged to the present time. The requirement that the superintendent must possess literary and professional qualifications in order to fill the office has been adopted in other States.

Salary.—The higher compensation which the superintendent receives, as compared with the teachers under him, has raised in the public mind the question: "How does the superintendent earn his salary?" To answer the question the school system may be likened to a manufacturing establishment whose operating expenses exceed the income by \$20,000. The deficit caused the stockholders to employ a more efficient superintendent, who by organizing the workmen, rearranging the work, and saving the waste of raw material not only prevented this loss but made a profit of \$50,000 by the end of next year. Did the new superintendent earn the \$5,000 salary which he received? To ask the question is to answer it. But in school work there is waste far more serious than the waste of raw material. The most valuable asset of a commonwealth is brains, and this goes to waste through inefficient teaching. The time and ef-

fort of pupils is too valuable to be wasted during the most plastic period of human life. It is the function of the superintendent so to organize and oversee the work at school that the people may get the largest return for the taxes gathered for educational purposes. The results of school supervision have established in public favor the office of superintendent and the policy of school supervision in every State of the Union.

Duties of the Superintendent.—Various functions are assigned to the superintendent. If he is to be held responsible for the efficiency of the schools he must have a voice in the selection, suspension, and dismissal of teachers, the promotion of pupils, the making of the course of study, the selection of the text-books, the purchase of apparatus, and the location, erection, and condemnation of school houses. In smaller towns difficult cases of discipline are referred to him for adjustment; in the cities and larger towns such cases go to the principal who then assumes many of the functions of a supervisor. Where a superintendent's powers are based upon statute it is easy for him to exercise these functions. When he must exercise them through committees the situation becomes very complex and requires the greatest tact and personal force.

Methods of Teaching.—The superintendent is everywhere expected to improve the methods of teaching. Hence he is charged with the duty of conducting teachers' meetings, and in some States he has charge of the annual teachers' institute. He makes reports to the board of education, stands between the schools and the newspaper reporter bent on mischief, between the teacher and the unreasonable parent, as well as between the schools and the ill-advised reformer. It is also the duty of the supervisor to protect the child from over-pressure in school work and from other unreasonable demands on the part of the teacher. He may, by ill-advised and too frequent examinations, ruin the methods of teaching and unnecessarily worry the minds of teachers and pupils. It is now recognized that children have rights as well as duties, that one of these rights is the right to be happy at school, that children can not be happy unless the teachers are happy in their work, and that no teacher can be happy if he or she is constantly annoyed by rude or unreasonable demands from the superintendent. Hence the educational leaders of America have insisted that the superintendent shall be courteous in manner, always pleasant to parents, teachers, and pupils, and capable of sending them away satisfied, even when he must refuse their requests.

Assistant Supervisors.—Where the administration of schools absorbs most of the time of a superintendent it has become imperative to appoint supervisors who take charge of special lines of work, like drawing, music, manual training, primary instruction. In the selection of these assistants it is important to get experts who can get things done. Mere inspection for the purpose of reporting what is done falls far short of the real purposes of school supervision.

From the nature of the case, county superintendents can not exercise as close supervision as is possible in cities and towns. Various duties

EDUCATION

have been assigned to them in different States, namely, to examine teachers, issue certificates, visit schools, conduct the annual institute, make reports to the Department of Public Instruction, see that the schools are kept according to law, that the State school appropriation and other school funds are wisely expended, and that school houses unfit for use are replaced by modern structures. The preparation of questions for the examination of teachers and the employment of talent for the annual institutes has in many States been delegated to the State superintendent and his assistants.

The Selection of Superintendents and Public Opinion.—Of the various plans for the selection of State or county superintendents, that by popular vote is least satisfactory. Nominating conventions are apt to select candidates for geographical reasons or political services, and not on the basis of fitness for the duties of the office. This may be prevented by public opinion. The superintendent has no duty more important than that of creating educational sentiment. The schools can not be made better than the people want them to be, nor will they be allowed to lag far behind the demands of public opinion. See SCHOOL SUPERVISION. NATHAN C. SCHAEFFER, Superintendent Department of Public Instruction, State of Pennsylvania.

Education, Industrial. The history of industrial education in the United States dates from 1835, when the Rensselaer Polytechnic Institute was established at Troy, N. Y., for the purpose of training young men in the art of civil engineering. Yale followed this example, in 1847, by the institution of the Sheffield Scientific School, and Harvard, in 1848, by the establishment of the Lawrence Scientific School. (See EDUCATION, ENGINEERING.) In 1855 an agricultural school was organized at Cleveland, Ohio (see AGRICULTURAL EDUCATION), and, since 1862, when the land grants voted by Congress for agriculture were also extended to technical schools, the growth of such institutions has been so general that there are now in the United States more than 190 special schools of this class, in which, by the simple systems of manual training, pupils are instructed in the various useful trades. (See TRADE AND MANUAL TRAINING SCHOOLS AND TECHNICAL EDUCATION.) In 1896 Massachusetts passed a law requiring every city of 20,000 inhabitants to incorporate manual training into its high school courses of study, and similar results have been attained, either through private beneficence or by legislative action in almost every portion of the country.

Education, Kindergarten. See KINDERGARTEN EDUCATION.

Education, Medical. See MEDICAL EDUCATION.

Education, National Systems of. All of the nations laying claim to any part in the civilization of the world sustain some kind of a system of common instruction. This is not only true now but it has been true as far back as history runs. Even the pagan nations which have consistently defied civilization have held and exemplified certain ethical principles, vari-

ous classes of knowledge, and many interesting and expert accomplishments which they have taught to their young. Some of the nations which we would not quickly classify as civilized maintain not only schools, but schools of differing grades and in some cases they are related together in systems of very considerable organized efficiency. The civilized nations have all developed, either under public or private control, institutions comprising school systems, often extending from the kindergarten to the university, and in many cases they have added elaborately equipped and purposeful educational systems going far beyond the functions of schools. The monarchical governments have educated a favored class more or less exclusively, giving but the rudiments of knowledge to the masses. The democratic governments have opened schools and other educative instrumentalities more and more to all the people. We are to present here, in a necessarily general way, the salient features of these different national systems of education, and will begin with those of the simplest form and the least international pretensions, and later take up those which are more ambitious and more elaborately and expensively organized. The order of presentation, however, must not be taken to indicate any close or deliberate arrangement of these different systems in the order of their excellence. It is not practicable to present all, or to present any very completely, and the order of arrangement is not to be taken as significant of merit beyond the general fact that we begin with the simpler and proceed to the more complex forms of organization and administration.

China.—China has undoubtedly maintained a system of instruction for the children of the higher classes and propagated certain very definite philosophical theories for thousands of years. The Imperial government provides a system of examinations, but leaves the training to parents or guardians. Schools are mainly supported by private subscriptions. The rich employ tutors for their sons. The girls count for little. The conditions of the masses are hard. Some classes maintain clan schools for their own children. Charity schools, supported by philanthropy, exist here and there. The best schools are conducted by the missionaries. The greater number of children are mainly without education. In recent years the Imperial government has established a university, a normal school, and a school of languages, and some of the provincial governments have opened colleges and military and naval academies. One province is attempting a system of graded schools. The whole school system is inchoate. Control by parents and filial regard for parents are national fetiches, regardless of the fitness of the parent for the exercise of control or for worship, and no duty of the State to the ignorant child of the masses is anywhere asserted.

Spain.—Spain has a system of primary schools. It is supported by local funds. The municipalities are by law charged with maintaining schools but the obligatory provisions do not seem to be much enforced. Worse than all, there is apparently but little educational sentiment. It seems strange that a people with such a long and, in some regards, an heroic history—almost conquering the world at one time—and a people with so much artistic feeling and so

EDUCATION

many polite accomplishments should have so little educational initiative. But it is so little that in the absence of government support and compulsion the schools are disjointed and often superficial. So far as the scheme of the educational laws goes it seems well enough, but it fails in the vital points of application and compulsion. Primary instruction is divided into three classes, viz.: first, instruction for infants between three and six years, elementary instruction between six and nine, and superior instruction for children between nine and 12. The work covers the ordinary primary subjects familiar in America. Some advanced schools are being developed and in many of the provinces there are normal schools for training teachers. The teachers' salaries seem to be determined somewhat by the size of the towns and vary from \$150 to \$900 per year. In addition to the absence of educational sentiment and initiative there is the no less notable absence of higher institutions to give zest and guidance to elementary schools. A census taken in 1860 shows that 20 per cent. of the population could read and write, that 4.6 per cent. could read only and that 73.3 per cent. could neither read nor write; a census taken in 1889 shows that 28.5 per cent. could read and write, that 3.4 per cent. could read only, and that 68.1 per cent. could neither read nor write; the last census, taken in 1900, shows that out of a total population of 18,607,674 there were 11,869,486, or 63 per cent. who could neither read nor write. Here is an ancient empire with history and traditions, conspicuous position and great resources, with extraordinary culture of a kind, and with varied refined accomplishments, and yet the masses are in sudden ignorance. It is not because of the lack of laws nor because there are no schools. It is because the laws are meaningless, because of false views of life, because Spanish history, with all of its valor, has not made for true civilization.

Italy.—In Italy at least one lower grade school is required to be maintained in every commune. Communes of more than 4,000 inhabitants must establish a high school. Classical instruction is provided in about a thousand institutions and technical instruction in about 400 advanced technical schools. There are many universities, of more or less importance. The leading libraries and art galleries are extremely rich in their possessions. These institutions exert a very considerable influence upon the intellectual life of the kingdom, as they certainly do upon the culture of the world.

Attendance upon the elementary schools seems to be enforced, but it does not extend beyond the ninth year. The elementary schools are supported by municipalities. The character of the schools is looked after by government school inspectors. Religious instruction is no longer obligatory. Many schools are supported by the Church, in which, of course, religion is taught. There are also many private schools established to serve one or another special end. In all of these the government requirements, which are not onerous, have to be observed. Education is practically free up to the university. Illiteracy is growing less. It is now about 35 per cent. and has decreased by about half in the present generation. There are many schools for special purposes, such as art, agri-

culture, mining, business methods, etc. There are 150 training schools for teachers, with 20,000 attendants. The government does much for musical training. The growth of religious toleration in the kingdom and the added intermingling with other peoples are clearly aiding the progress of Italian education.

Japan.—Japan presents probably the most conspicuous illustration in the world of the quick formation and the rapid evolution of a national system of education. In 40 years the Japanese people have passed from a chaotic educational situation to one very definitely, very completely, and very systematically and philosophically organized and administered. Where so much has been done in so short a time there is undue tendency to exaggerate statement and commendation, but there can be no doubt about the spirit and purpose and plan and determination which have accomplished so much, being entitled to the most enthusiastic admiration and approval, even though we distinguish the fact that the things accomplished could not, in so short a time and under such conditions, come abreast of the educational progress of some of the older and more democratic nations.

The elementary school system is practically universal, there being 27,000 schools in 1902-3. The attendance of children between six and 14 is compulsory, and the people in Japan seem to be in the habit of doing as the law directs. In 1902-3 the attendance of both boys and girls was more than 90 per cent. of the school population. Comparing this with the situation before the Japan-China war of 1893-4, an increase of 33 per cent. in attendance in less than 10 years is apparent. The attendance of girls is nearly equal to that of boys. The number of teachers is over 90,000. The schools above the elementary grade seem to consist of a half-dozen secondary schools whose function is to prepare students for the Imperial Universities at Tokio and Kioto and for various art and industrial schools. The universities embrace faculties of law, medicine, engineering, literature, science, and agriculture. In 1903 the number of resident instructors in the University of Tokio was 222 and the number of students 2,880. There are many libraries and museums. Education seems not only to be pervasive but very intensive in Japan. The observation of other peoples by the Japanese is wide and keen, and they quickly adapt to their own ends whatever attracts their attention in other lands. The government has been accustomed to send the most prominent young men to European and American universities to be educated, but this hardly seems necessary any longer. However, the diplomatic representatives of Japan are exceedingly and uniformly alert in observing and reporting everything which may prove advantageous to the intellectual progress of the empire, and many special commissioners are sent abroad to study subjects of particular interest to the educational, military, and industrial activities of the empire.

Perhaps it ought to be observed here that in Japan, as in all governments where the form of government is so extremely monarchical and classes among the people are well defined, some education may be pretty nearly universal while all education is not so. This is much, very much, better than nothing, but it is not all. The system does not open the higher schools to the

EDUCATION

masses, or at least it does not encourage the child of the masses to seek their advantages. So much is ordinarily true of all nations where classes are distinctly differentiated. But it must be said that the educational system of Japan has at once come to be remarkably balanced and diversified. It expresses the traits and promotes the progress of a people with marked characteristics. The elementary part of the school system is not only universal but, better still, the mighty and conclusive power of the government is exercised to have the elementary schools provide the beginnings of learning to all the children, boys and girls alike. Since 1900 tuition in the elementary schools has been free. The training of the teachers is thorough, the discipline of the teaching force excellent, and the supervision is close and under immediate government control. The methods for enforcing attendance are effective and apparently there is no thought of evasion. This is surely putting monarchical government to its best uses and it is not for us to say that such a form of government exercised for such ends, over such a people, is not quite as suitable as any other.

Great Britain and Ireland.—In England, Scotland, and Ireland we have our conspicuous illustration of a people who could set the limits to the power of the king, and establish government by the suffrage and under a constitution, without marked or general educational progress. From the beginnings of English history a small number of high grade universities with a few tributary fitting schools have trained the sons of the nobility, while the elementary education of the masses has been meagre, precarious, and lethargic. There has never been before the present generation—if indeed it may be said that there is now—any common school system in England. There have been elementary schools, upon one footing or another, nearly or quite everywhere, and the habit of sending children to school has been general, but these schools have not been under popular control, and they have not led up to higher institutions. They have lacked in self-activity, spontaneity, and aggressiveness. As a consequence the masses have the rudiments of learning, and this, with the strength and balance of the native character, means very much. But the fact remains that because the elementary schools have really had no connection with the schools above, the children of the masses are without educational opportunity and the educational system lacks in national coherency, strength, and elasticity.

Why is this so among such a great people who have done so much for freedom and constitutionalism? No doubt the answer is found in the prevalence of ecclesiasticism, in the measure of control which the Established Church exerts over the learning of the kingdom, and in the stubborn opposition of churchmen to forms of educational activity which are not at one with the fixed thought, plans, and ends, not of religion but of church organizations. Parliament has been struggling with this subject for generations. As democracy slowly advances to larger power in the parliament house and as the advantages of a free and articulated school system in other countries, and particularly in the United States, become obvious, more and more ground is gained—but the process is a slow one.

In England an act of Parliament passed in 1870 established school boards chosen at popular elections. The independence of these boards was very considerable and, therefore, their adaptability to particular conditions was marked. But by legislation in 1902-3 the local administration of schools of all grades was given over to the county, or county borough, council. Again the application of so much unification as this implies has been relaxed by excepting noncounty boroughs with a population of over 10,000 and urban district councils with a population of over 20,000, which the act declares to be entitled to control their elementary education. In 1891 an act was passed giving to every parent the right of obtaining free elementary education for his children between the ages of three and 15 and as certain schools still continue to charge fees, the school boards are often put to their resources and ingenuity to find free instruction for all who demand it. Church schools are numerous. The conflict of interests between church schools and board schools, and between the adherents and supporters of each, are frequent, and the whole subject is a continuing source of acrimonious discussion and of unceasing educational uncertainty.

Beyond the elementary schools there are institutions of all kinds and grades. There is no organized system of secondary schools. As of yore the fitting schools for Cambridge and Oxford continue. The overwhelming, if not the fatal, defect in the English school system has grown out of English thought and history. It is that the universities and preparatory schools are to serve the aristocracy, and that any extension of these instrumentalities to the masses will unsettle and unfit them for service to the aristocracy. Accordingly, there is not only no settled and universal school system for elementary instruction, but there is no organic connection between such elementary schools as there are, and such secondary and university institutions as there are above them.

But this has not interfered with, perhaps it has promoted, the development of business and trade and technological institutions. The defeat of British industrial interests in the competitions at world's fairs in the present generation has undoubtedly served as an impetus to the progress of instruction bearing upon the nation's industries.

A word as to the compulsory features of the English elementary school system should be said. By an act passed in 1876 attendance was first made compulsory and subsequent acts have made the compulsory provisions more stringent. As a general rule it is now obligatory for children from the age of five to the age of 12 to attend school, and they must attend from 12 to 14 unless they are excused wholly or in part by reason of having passed prescribed examinations, or having attended with marked regularity before the age of 12. In 1893 the attendance of blind and deaf children between seven and 16, and in 1899 the attendance of defective and epileptic children between the same ages, were made compulsory. Parents and guardians are made responsible for the attendance of children within the compulsory ages and are fined for delinquency, and employers who give work to children who are bound to be in school are fined heavily. The attendance laws seem to be very

EDUCATION

well enforced. Illiteracy is low. Exact data are not obtainable. In recent years only about one man in 40 and one woman in 40 have been unable to sign their marriage certificates.

No word of commendation bearing upon the historic English art and literary institutions, outside of the schools, which culture thought and give even added substance and warmer color to English character in general, and particularly to the classes liberally educated, is needed here. They are many and great—a good part of the intellectual instrumentalities of the world.

The Scottish school system comes nearer to that of the United States than that of England does. It has come down from the times of John Knox. It undertook to establish a school under a qualified master in every parish and made the maintenance of the same a charge upon the land revenues of the district. The influence of the Scotch education department upon all educational activities in Scotland is very considerable. This is the government department which administers government grants in favor of education, which prescribes the general lines of organization, and fixes educational values. It acts through inspectors or others charged with particular duties. The primary schools are general and they seem more often to carry their work into what we call the secondary schools, than is common in England. Coeducation in all grades is common in Scotland and has been for a long time. The universities are strong and the Scotch character is strong. Many enter the universities from all walks of life. Scotch history supplies the reasons why democracy seems to be freer in Scotland than in England, and the results are obvious enough in the educational system. Still it must be said that the lack of organic connection—of the continuous road—between the elementary and the advanced institutions is obvious enough also, and it is of much moment from the American point of view.

Attendance upon the elementary schools from five to 14 years of age is exacted, but some exemptions are granted after 12 years of age. The responsibility is placed upon the parents, and the penalties include both fines and imprisonment. In 1890 the attendance of blind or deaf mutes was made compulsory. The sentiment of the people combines with the efficiency of the government to make attendance general, and the percentage of illiteracy is low.

As to education in Ireland there is not a very great deal to be said, but so much as may be said is exceedingly hopeful. There are some Americans who do not realize what great institutions and what fine educational instrumentalities may be found in Ireland. These of course appear in the principal cities and they minister to the higher classes. The poverty of many in the country, particularly in the southern part of the island, is a great hindrance to the universality of the elementary schools. Yet the government grants have become relatively liberal, and the determination to enforce the organization of and compel attendance upon the schools has become decisive in the last decade. The Irish Education Act of 1892 exacted the attendance of children over six and under 14 years of age, but some exemptions are granted to certain children over 11 years of age. It was said with authority in 1902 that the compulsory provisions of the act were being satisfactorily enforced by com-

mittees in 131 different places. The general average of attendance is low but steadily improving. The government grant for primary education in Ireland for the financial year ending 31 March 1904 was £1,000,000 sterling. It may be said rather confidently that whatever work is done is as a rule very well done, and that the sentiment of the people touching education is steadily improving and highly promising.

If this article laid any claim to being a history, or even a very exact description of national systems of education, it would be necessary to go into an examination of the British influence upon the intellectual life of the colonies and dependencies of the nation. It would be a profitable and perhaps a fascinating study. In several directions, particularly in Canada, Australia, and India, it would have a somewhat significant bearing upon world education. It is obviously impossible to enter this broad field at this time. But it must be said that wherever the flag of Britain has been raised, there schools have quickly resulted, and there order and system have led speedily to the generation of intellectual energy and to the diffusion of learning. Kipling's virile verse is not without sufficient reason:

They terribly carpet the earth with dead
And before their cannon cool
They walk unarmed by twos and threes
To call the living to school.

France.—There is a very completely organized and a well-nigh universal system of education in France. It has developed with marvellous rapidity since the Franco-Prussian War in 1871. It is hardly too much to say that it resulted from that war. In a great measure it did, but other contributing causes must not be lost sight of. It is an autocratic and in some ways a mechanical system, but it is autocratic and mechanical because of the necessities of the situation. It is a system which knows much of the history and philosophy of education and which puts to its uses the courses and the processes which the most enlightened educationists believe to be of the most worth in raising the level of a nation's intellectual and industrial capacity. It is not free from the incumbrances and hindrances peculiar to the political and religious history of the French Republic, but it seems to be freeing itself with truly spontaneous energy and elasticity, and the process has already gone so far that the danger of arrest or of retrogression has been practically eliminated.

The educational system of France has been marked by exactness, and the work it does is characterized by completeness. The State controls all. The Minister of Education is the autocrat of all things in the French schools. The differentiation of schools into primary, secondary, and higher is not only rigid but desirable. Next to the Minister there is a director over each of these subdivisions of the school system. These officers are aided by inspectors. The educational policies result very largely from a higher council, a dignified body of leading educators, which meets twice a year under the presidency of the Minister of Education. The members of the Council are appointed for four years. There are 60 members. Thirty are professors and representatives of the advanced schools. Six are chosen by officers of

EDUCATION

primary education. Four, who represent private instruction, are appointed by the President of the Republic on the recommendation of the Minister of Education. Five are elected by the *Institut de France* from its own membership. Nine councilors appointed by the President of the Republic and six designated by the Minister of Education constitute the "permanent section," which meets once a week. With some appropriate division of authority and responsibility, these bodies lay out the educational plans of the Republic and exercise very decisive control over the satisfactory and complete enforcement of those plans.

The teachers in the public schools must be of French birth and must meet the requirements fixed by law. The private schools are subject to government inspection and direction. A naturalized citizen may be authorized by the Minister to teach in a private school, but the exclusion of foreigners from even the private schools seems severe. There are more than 100 normal schools for training teachers, which practically supply all the teachers needed, and the system for examining and certifying teachers is elaborate and exacting.

The inspection of the schools is systematic and close. There are general and local inspectors in large numbers. The average is something like one inspector for 200 teachers, but by the increase in inspectors the number of teachers to an inspector is growing smaller. The inspection districts vary in size. The supervision of the normal and technical schools, of the manual training, and of gymnastics and military exercise is somewhat accentuated.

Coming to the schools themselves, it may be said that they exist everywhere. They are classified about as follows: (1) the mothers' schools for children from two to six years old, (2) the lower primary schools for children from six to thirteen, (3) the upper primary schools and complementary courses annexed to the lower primary schools for children who have completed the work in the latter schools, (4) the manual training schools, with courses at least three years long, which receive pupils from the primary schools and develop technical aptitude. They complete the instruction of the elementary schools for pupils apparently destined for industrial life, (5) classes for adults and apprentices where the instruction has practical reference to the trades.

The elementary schools are free, even the books, paper, pencils, ink, etc., being generally gratuitous. Even more, food and clothing are sometimes provided. The expenditure for elementary schools is very large.

The work is generally excellent. It rests upon a philosophic basis and relates very decisively to the artistic tendencies which are always liberally present in the French people, and to manual dexterity. All the usual branches are well covered, with apparent emphasis upon drawing, work requiring the use of tools, the household arts, and music. Of course the outcroppings of militarism are often manifest. The branches which are simply culturing without manual labor are not neglected. The equipment of the schools, particularly in the cities, in apparatus and implements seems to be very abundant, and it is said that much of this is made by the pupils.

The aids to the life of the schools are very many. Libraries, art museums, musical institutions, are numbered by the thousands, and mutual aid societies, asylums for the unfortunate, and reform schools are too numerous to be treated with any detail.

The secondary school system is apparently attaining rapid development, but it is yet immature. The universities are many, strong, and yet growing stronger. So far as the writer can see, there is lack of articulation between the lower and the upper schools. It seems to be closer between the lower and the middle schools. Certainly the greatest emphasis is thrown upon the primary schools.

Primary instruction is obligatory upon all children between six and thirteen years old, unless in a particular case a child who is over 11 years of age is exempted by reason of his proficiency duly established. The instruction may be in a public or private school or in the family, but apparently the fact and quality of it must be indubitably established. Complete lists of children are continually maintained, and all upon the lists have to be accounted for. People in France are compelled to do things and they have got in the habit of it. Fifteen days before the opening of the school term the parent or guardian must notify the mayor of the commune whether his children of the attendance age will go to the public school, or to a private school, or be instructed at home. If the notice is not given the child is enrolled in the public school and the parent advised. Then the public school authorities must report on him. The only excuses accepted for absence are the sickness of the child, a death in the family, and some accidental and temporary break in communication. The penalties run against the parent or guardian, are sufficient, and the procedure is regular and as a matter of course. The percentage of illiteracy is not unreasonable and is improving. It is about one in 16, which, in view of the really recent origin of the French school system as now rated, is not unsatisfactory.

The criticism which will occur to an American concerning the school system of France will relate to its *rigidity*. It seems to be the idea that the same thing must be done everywhere, and at the same time, and in the same way. There is lack of allowance for differences in local conditions. All children seem to be put through the same processes. The teachers are trained under a system which is exactly uniform. The freedom of the universities does not act upon the elementary schools. There is little local color through local freedom in organization and administration. The people themselves are without the advantage of administering their own schools. There are doubtless some advantages and some disadvantages in this. It is not a matter of election. It is a matter of history, of habit, of accepted understandings, and of outlook. The French system presents an extreme. Another extreme is presented in some of our American States. Very likely the golden mean is between the extremes.

Switzerland.—There can be no treatment of the educational system of Switzerland, which is both brief and exact. The country determined upon a universal system of primary schools nearly a century before England took that step. The

EDUCATION

obstacle to a brief description is in the fact that each of the 25 cantons has its own organization, and there is not much legislation of general application to the whole country. The Confederation makes free primary education compulsory, but leaves the limits and details to the cantons. The Constitution forbids the employment of children in factories before they are 14 years old, with the further provision that in the 15th and 16th years the time given to work, to the "continuation schools" and to religious instruction shall, taken together, not exceed 11 hours per day. This is important in view of the continuation and evening schools, at the latter of which attendance is often compulsory. The Federal Constitution also requires all boys between 10 and 15 years of age to be instructed in military drill and attendant exercises.

The primary schools are non-sectarian. The different cantons are somewhat distinguished by differences in national descent and in church tendencies. Both the Evangelical-Reformed Church and the Roman Catholic Church are recognized by the State, but the instruction in the primary schools is secular.

There are six universities, at Basel, Zurich, Geneva, Freiburg, Bern, and Lausanne, with foundations from 1460 to 1832. There are excellent academies at Freiburg and Neuchâtel, and a strong polytechnic school at Zurich. The country is not at all lacking in libraries, art museums, and other stimulating incentives to learning. The different parts of the educational system seem to be correlated. The republican form of government gives an air of freedom to the whole which is not common in Europe.

The system for insuring the attendance of all children within the general ages from six to sixteen, with immaterial variations in the different cantons, is substantial and effective. The sentiment of the country supports the schools with remarkable universality. Illiteracy is practically unknown. Switzerland furnishes an excellent example to Europe of what a small republic can do for law and order and self-enlightenment as a people, and for individual opportunity, industry, and happiness.

Netherlands.—The Dutch educational system seems to have maintained a very uniform growth from the dark days in the latter part of the 16th century, when the nation set up not only common schools but universities in celebration of the military victories over the Spaniards in the first really great and prolonged war for religious freedom, which almost unconsciously led into political freedom as well. The system now embraces schools of every kind and grade, including good secondary, technical, and normal schools, and four State universities, which are ancient in origin and much regarded. Since 1857, and particularly since 1878, the instruction in the primary schools has been undominational. Attendance has been obligatory since 1900, and the people who cannot read or write are about one in forty of the population. The expense and management of the schools are divided between the general and the State governments. Institutions bearing upon the agricultural and mechanical industries are by no means lacking, and fine libraries, museums, and architecture, evidence, while they aid, a substantial and assiduous people.

Denmark.—The educational system of Denmark diffuses throughout the kingdom a grade of learning very well suited to such a people. Primary schools are common but not free, except to the poor. Attendance is compulsory between the ages of seven and fourteen. Illiteracy is almost a negligible quantity. The established religion is Lutheran and it embraces almost the entire people, but other denominations are tolerated. Denmark seems to excel in secondary schools. Technical and professional schools are common. The country is essentially agricultural, and the fact is plainly discernible in the strong points of the educational system. At the head of the system stands the University of Copenhagen. The Royal Library at Copenhagen has 500,000 volumes and is exceptionally rich in original manuscripts. There are two other public libraries in the city. Matters are managed very exclusively by the State, and the level of intelligence and thrift seems high.

Norway.—The primary school system of Norway seems to reach all of the people effectively. It embraces a seven-year course suited to children from seven to fourteen years old. It is a national system; is free, and attendance is compulsory. The distinguishing feature of the elementary school system seems to be a class of "ambulatory schools," which are moved about from place to place in the thinly-settled districts. Beyond the primary schools the towns have superior schools of all grades and kinds. There are six teachers' seminaries. At the head of all is the Royal University at Christiania, founded in 1811. The State religion is Lutheran, but all denominations are tolerated.

Sweden.—There is practically no illiteracy in Sweden. The statistics show less than one illiterate in a thousand of population, and so much is said to arise from a few Finns in the extreme north. Of the conscripts in the army in 1900, 69.8 per cent. could read "fluently," and 30.2 per cent. "fairly well." This tells the story of the national system of education. Probably no country in the world gives more exact and persistent attention to education than Sweden is now giving. The Common School Statute of 1897 requires at least one primary school in every district. Where large enough, at least two grades of instruction are maintained, viz., an infant school for beginners and a common school proper for the more advanced pupils. In the former the instruction is arranged for two, and in the latter for four years. Attendance is, of course, compulsory. It must be from seven to fourteen years of age. The responsibility is upon parents and guardians, and the school board is by law bound to see that the obligation is fulfilled. If children are deficient of the required knowledge after passing the ordinary time in school, they must continue until they can meet the State's requirements. No obstacle—not the sickness or poverty of parents, not even the need of their labor to earn the family bread—is allowed to come in the way of every child being required to possess the elements of learning. If necessary, the child is given to the care of others and the expense forced from the parent or guardian.

The State pays exceptional attention to the defectives—the deaf, and dumb, and blind. This training is compulsory, also. Deaf and dumb schools are established on a large scale,

EDUCATION

and the State bears the expense. This extends not only to the defectives, but also to the disabled.

The trend of education in the country seems toward training every boy and girl to read and write, to attend to household duties, and then to make useful things with his or her hands. The obligatory subjects of instruction are religion, the Swedish language, arithmetic, geometry, geography, history, natural science, drawing, gymnastics, gardening. The expenses are borne by national grants and local taxes.

Secondary schools also form a part of the public school system, and a national university at Upsala exercises a very considerable influence upon the whole. The system is ancient, substantial, and comprehensive.

Germany.—For the long established, territorially extended, philosophically organized, capably directed, thoroughly accepted, and notably efficient, national system of education in Europe we must go to Germany. And if we were to undertake the exact study of any one system of German schools we must go to that great leader which embraces much more than half of the territory and population of the 26 German States which comprise the German Empire, established by the peace with France in 1871—*Prussia*. This is not saying that the Prussian school system is better than any other in Germany; only that it is the oldest, the largest, the most comprehensive, and, therefore, the subject of the most interesting study.

The laws of the Empire provide for primary schools in every city, town, and village. As a result there are something like 60,000 of these primary schools, with 125,000 teachers and over 8,010,000 pupils. These schools are supported by some local rates and by much government aid. Parents are compelled to send their children from six to fourteen years of age to a primary school. One of the strongest points in German life is the very nearly universal and thoroughly established habit of sending the children to school. Compulsory attendance has been in operation for 63 years in Prussia. It is much for a mighty people to assume by common understanding that none but an imperative cause is to keep a child from school a single day when he ought to be there, and that nothing whatever is to be allowed to rob him of his right to an elementary education. This is apparently the case in Germany, and as a consequence the rate of illiteracy is diminished almost to the vanishing point.

Kindergartens are common in Germany, but are ordinarily if not invariably carried on by private enterprise.

"Continuation schools" are provided for the children of the working classes who want to do more work than is provided in the primary schools. They provide courses for two and three years and their work runs into trade instruction.

The regulations touching primary school-houses in Prussia illustrate the national estimate of the importance of educational details. Of course there are many buildings which were erected before the modern regulations were deemed necessary, and such regulations are not always enforced in Prussia, but they are quite

suggestive enough. The building is to be erected in a sunny and dry open space, away from the most-used streets. In the cities the interior of the block is preferred. Quiet is imperative. Good water is sought. Playgrounds are demanded. If the building has more than one story the youngest children have the ground floor. In building anew, provision must be made for enlargement. Every detail of construction is specifically treated. Use of new buildings is prohibited until thoroughly dry; in stone and brick buildings six months is allowed. The size of rooms is regulated; even the shape of rooms is regarded. So, too, is the size, form, and location of doors and windows. Heating and ventilation are specifically treated. The width and length of halls and the width and height of stairs are specified. The form and situation of desks; the height, width, and depth of the platform upon which the teacher's desk stands, and the need of hooks and pegs for hats and coats are all set forth.

Of course a national system which regards all these small matters touching the school accommodations, with reference to the health, eyesight, and convenience of teacher and pupils, cannot neglect the details of the courses pursued or the sufficiency of the instruction; and it does not.

Secondary schools are found everywhere. Their work is varied but leans toward the classical, the culturing, the professional, and their line of cleavage is quite clearly a social one. Provision is made for the secondary education of girls as well as of boys.

Then follows a large variety of advanced special schools, such as schools for defectives, academies of forestry, polytechnics, schools of agriculture, of mining, of architecture, of art, and of music. There are more than 250 normal schools for training teachers.

Above all the rest there are 21 universities, some of them with just reputations which have attracted students from all parts of the educational world. In 1900 there were 2,800 teachers and 34,000 students in these universities.

The fundamental and distinguishing characteristics of this mighty system of education may perhaps be enumerated as follows: (a) the full and regular attendance of children of school age; (b) the habit of uniform obedience to the State's authority; (c) official exactness concerning the quantity of the work to be done in each grade of schools; (d) uniformity in the work of each grade, with 42 to 45 weeks of work in a year; (e) the fact that each grade of school leads to something beyond, to work as much as to higher schools; (f) that the "something beyond" is suited to whatever manner of life the child is likely to lead; (g) the adequate preparation of the teachers, the exclusion of immature or unprepared teachers, the certain tenure of teachers, and the consequent dignity of the teacher and his work; (h) the inspection of private teaching and the assumption of entire responsibility for the education of the country by the government; (i) the apparently open opportunity for all, accompanied by a marked contentment with one's situation and a readiness to do what is reasonably within the reach of one's station in life; (j) a very considerable evenness of educational instrumentalities and oppor-

EDUCATION

tunities in all parts of the Empire; (k) very many heights of scholarship which are not out-ranked by any in the world; (l) deep and common civic responsibility for the character of the schools.

In the work of the German schools the ordinary work in American schools is included, but special emphasis is laid upon physical exercise and militarism, upon drawing and manual skill, upon needlework and other domestic arts, and upon music. Everything is done to nourish love for the Fatherland. The portrait of the Emperor is required to be displayed in every schoolroom. The national songs are sung often and well. The accomplishments of the nation are well told. Everything is done for contentment, for scientific scholarship, for industrial productivity, for military efficiency, for the happiness, oneness, strength, and greatness of the German Empire.

Mention of the important fact that religion is a vital part of the primary school curriculum of Germany must not be omitted. Whether the child goes to a public school or a private school, or is instructed in the family, the State demands that he be instructed religiously. If the school be one of Protestants, Roman Catholics, or Jews, the master must see that the religious instruction conforms to the religious preferences, and whoever gives any instruction, including the religious, must have the authority of the government behind him. If the schools are mixed religiously, the instruction must accord with the beliefs of the greater number; perhaps in some cases the dogma and doctrine are somewhat mixed, too; more likely the religion is not so theological as some would make it. The clergymen are in a sense representatives of the State. The greater number receive a considerable part of their salaries directly from the State. They have been educated in the different grades of the schools, including the divinity schools of the universities, and are easily adaptable to the needs of German religious education.

In view of the purely non-sectarian character of American public schools and of the frequent discussion of religious training in this country, it is interesting to notice how the German law treats the matter. The following are among its provisions: The character of the religious instruction is determined by the father. Where the father and mother are of different denominations an agreement made before marriage to train the children in the religion of the mother has no legal effect. On the death of the father the instruction must continue in his faith and no death-bed conversions to a different faith are recognized. On the death of the father the court must attend to the matter. Children born out of wedlock must receive religious instruction in the faith of the mother. After 14 years old children may decide for themselves as to the denomination they will affiliate with. Before 14 no denomination is allowed to receive a child or permit a confession of faith other than that to which the child belongs by law.

The reader needs no assurance that a people doing so much for schools of every grade from the kindergarten to the university has accumulated many and great aids to information and culture outside of the schools. We know it would be so and that it is so. The libraries,

museums, art galleries, architecture, palaces, mausoleums, and monuments of the Germans fittingly augment and round out their system of education, but obviously we cannot enter upon even a partial description of them here.

Comparisons with the United States.—The extended treatment which has been given to various phases of the American educational system in this department makes any general presentation of our own system unnecessary in this place. But I cannot forbear observing that it is clear enough that there are some advantages and some disadvantages with us when we come to compare ours with other systems. Such comparison may be hazardous, but I shall venture to express the thought that in regard for details and in a commonly exercised and accepted power to regulate them; in the appreciation of the necessity of universal and regular attendance of all children within fixed ages; in training for specific industries and common employments and in promoting contentment; in realization of the bearing of the work of the advanced schools upon the lower ones; in providing for the philosophical and exact preparation of teachers; in dignifying the teacher's position; in fixing educational values and in avoiding erroneous estimates of scholarship and culture in the affairs of the people, and particularly in determining the policies of the government of the nation, there are foreign systems of education which have claims superior to the corresponding claims which may be made on behalf of the American system.

On the other hand, it seems to me that in the adaptability of schools to agricultural, and particularly to pioneer, conditions; in such general inclusion of high schools, and now of State universities in the public educational system; in the steady correlation and solidification which is going on between all grades and kinds of institutions; in the continuous road from the lowest to the highest, and the encouragement which is given every ambitious child of the people to follow it; in balancing State and local control and in developing so much and such efficient local supervision; in the cheerful generosity by which the public schools are supported, and the monumental munificence with which private schools are established and maintained; in the fullness of religious toleration and the cordiality with which all classes from all peoples are working together for learning; in the elasticity and flexibility of the whole system, the freedom of its opportunity, the aggressiveness of its spirit, the grandeur of its outlook, and the measure of its accomplishments and of its confident expectancy; in the ripeness of its scholarship at many points and the tendency to diffuse and absorb scholarship at all points; in the growing regard for the implements and results of scholarship and the unlimited determination to have whatever will aid learning; and particularly in the popular administration of the system, the universal sense of proprietorship, and the retroactive influence of this upon the buoyant intellectual and moral sense of the nation, we have educational advantages which are hardly enjoyed by any other people.

The political theories which developed very early and very strongly in the pioneer life of America and which have become the universal

EDUCATION

policy and almost the passion of the country in its maturer life, have had a controlling influence upon the scheme and the scope of our educational system. They lead us to hold up some ideals and undertake many ends which other nations, even the best of them, never think of or never attempt. We must give every American child an equal chance. The equal chance means that each must have legal and actual right to all the learning that he has the time, the preparation, and the strength of purpose to get. The system which provides this widely diversified instruction must necessarily be adaptable to widely diversified conditions, to city and country, to old states and new ones, to all conditions of climate, of geographical situation, of means, of experience, and of learning. About the only constant and uniform factor in it all is the universal American spirit. Beyond this is the weighty fact that the American educational system has to be organized and administered through the helpful agencies of the State but through the actual management of the people themselves. The centralized and arbitrary administration which accomplishes so much within fixed and commonly exclusive limits in many other lands is repugnant to our fundamental political philosophy. The result doubtless is that undertaking so much, for everybody, and through extreme forms of decentralized and popular government, we do not accomplish all we undertake as completely as some other nations accomplish the more aristocratic and autocratic, the less democratic and less ambitious, ends which they undertake. For example, it is clearly true that there are several other nations where the percentage of people who cannot read and write is considerably lower than in America, but it is highly probable that there is no other nation with a higher general level of scholarship, of resourcefulness, of ambitious and educated purpose, and of disposition to use all of the means that can actually promote the higher enlightenment of all the people. The American people are steadily gaining in disposition to do, and in ways and means of doing, by doing things for themselves. Fresh from this review of other great national systems of education, and admitting some things that we are not doing at all or not doing as well as they, we falter not in the belief—rather we are strengthened in it—that our political system and our resultant educational system are fraught with more good to all the people, to all the higher interest of the world, than any other, because it is moving on, steadily and forcefully, to more distinct and decisive and uniformly important culminations.

ANDREW S. DRAPER,

Commissioner of Education, State of New York.

Education, Negro. See NEGRO, EDUCATION OF.

Education, Professional, in America. At the time of the Declaration of Independence there were only two professional schools in the United States, the Medical College of Philadelphia (1765), now the medical department of the University of Pennsylvania, and the medical department of King's College (1768), now Columbia University.

The following statistics for the year 1904, as prepared by the commissioner of education,

show a remarkable growth in this particular phase of education in the United States:

CLASS OF SCHOOL	Schools	Instr't's	Students	Graduates
Theological.....	153	1,055	7,392	1,620
Law.....	95	1,167	14,306	3,288
Medical.....	152	5,252	26,949	5,702
Dental.....	54	1,191	7,325	2,192
Pharmaceutical.....	63	611	4,457	1,308
Veterinary.....	11	165	795	198
Totals.....	628	9,441	61,224	14,308

In 1904, the total amount of property controlled by these schools was estimated at \$33,027,675. The income of these institutions amounts to \$3,279,358, and the number of volumes in the school libraries is 2,286,980.

Among the 153 theological schools are 28 Roman Catholic institutions, 18 Presbyterian, 2 United Presbyterian, 2 Reformed Presbyterian, 1 Cumberland Presbyterian, 10 Baptist, 1 Seventh Day Baptist, 2 Free Will Baptist, 3 Lutheran, 17 Evangelical Lutheran, 1 German Lutheran, 10 Congregational, 12 Protestant Episcopal, 13 Methodist Episcopal, 4 Methodist Protestant, 7 Reformed (Dutch) Church, 2 Jewish, 4 Christian, 3 Universalist, 3 Non-Sectarian, 1 Moravian, 1 Unitarian, and 8 others.

There is no national authority in the United States that can prescribe standards for degrees or for license to practise the professions. Each State makes its own professional laws. As a result there are almost as many standards as there are political divisions. The desirability of uniform standards throughout the country for admission to professional practice is recognized generally, but varying conditions as to density of population, educational advantages, and general development make it impracticable to hope for the attainment of this end for some time to come. In 1850 the public had little protection from incompetency in professional practice. The bar is said to have been at its lowest ebb. Medical laws were crude and largely inoperative. In several States only were there any acts designed to control the practice of pharmacy and dentistry. There was no law whatever restricting the practice of veterinary medicine. There has been extraordinary progress, especially in the last decade, in restrictive professional legislation, and in the admission and graduation requirements of professional schools throughout the United States. In New York State a preliminary general education equivalent to graduation from a four years' high school course after a completed eight years' elementary course is prescribed by statute as the minimum standard for license to practise medicine. This standard approximates that required in continental Europe. New Hampshire has similar requirements, but they are not as rigidly enforced. The statutes of Delaware, Maryland, New Jersey, and Pennsylvania prescribe a "common school education." Louisiana demands "a fair primary education." The rules in Vermont prescribe a high school course; in Illinois and Iowa less than one year of high school work; in Virginia, "evidence of a preliminary education." In remaining political divisions laws and rules are either silent in this respect or so indefinite as to be of little value.

In New York and Illinois a preliminary general education equivalent to a three years' high school course is required for admission to the bar. Connecticut demands a high school

EDUCATION

education or an indefinite preliminary examination. The minimum requirement in Michigan (in case of examination) is less than two years of high school work, in Colorado it is one year of high school work, in Minnesota (in case of examination) it is less than one year, in Ohio it is a common school education. If anything is demanded in other political divisions the requirement is not sufficiently established (excepting a few local cases) to find a place either in statutes or court rules.

The New York law exacts a full high school course as one of the requirements for license to practise dentistry. New Jersey demands by statute "a preliminary education equal to that furnished by the common schools." Pennsylvania "a competent common school education." Virginia a "fair academic education." In other political divisions there is no such requirement. Louisiana, Michigan, South Dakota, Wisconsin, and, in case of examination, California and Texas are the only political divisions which mention in their rules preliminary general education as a requirement for license to practise pharmacy. An elementary education only is prescribed. The completion of a full high school course or its equivalent is one of the statutory requirements for license to practise veterinary medicine in New York. Pennsylvania demands "a competent common school education." There is no such requirement in any other State.

In New York, high standards in preliminary general education are demanded both for degrees and for licenses, and in each case the question of attainments is determined by a central authority, the University of the State of New York. As a rule in other States the professional schools conduct their own entrance examinations, and the tests are often mere matters of form, even though the standards may appear satisfactory on paper.

Entrance Requirements.—In 4 theological schools there are no entrance requirements; in 24 schools they are indefinite; 19 demand a grammar school education; 1, 6, and 19 require respectively one, two, and three years of high school work; 18, 3, and 71 demand respectively one, three, and four years of college work.

In 16 law schools there are apparently no entrance requirements whatever; in 8 schools they are so indefinite as to be practically worthless; 26 schools demand a grammar school education; 8, 11, 12, and 3 require respectively one, two, three, and four years of high school work. Harvard demands an education equivalent to that required for admission to the senior class. The Columbia Law School is maintained as a graduate department after 1903.

In 2 medical schools the requirements are indefinite; 29 demand a grammar school education; 97, 12, 3, and 12 require respectively one, two, three, and four years of high school work. Johns Hopkins and Harvard require a college course.

In 3 dental schools the requirements are indefinite; 18 demand a grammar school education; 18, 11, and 6 require respectively one, two, and three years of high school work.

In 6 schools of pharmacy there are no entrance requirements; in 4 schools they are indefinite; 24 demand a grammar school education; 11, 6, and 1 require respectively one, two, and three years of high school work.

In 1 veterinary medical school the require-

ments are indefinite; 9 demand a grammar school education; 1, 5, and 1 require respectively one, two, and three years of high school work.

Courses in theology, law, and medicine are naturally graduate courses and will eventually be maintained as such by leading universities. It is believed, however, that it would not be advisable or even desirable for the State to make graduation from college the minimum requirement in general education for degrees even in these faculties. High school graduation is sufficient for the minimum State requirement.

University Supervision.—As long as the public had practically no protection from incompetency in professional practice independent proprietary schools flourished. With proper restrictive legislation such institutions will either die or fall under university supervision.

Many professional schools not under university supervision show a self-sacrificing zeal for high standards and an absence of the commercial spirit that might well be emulated by all institutions connected with colleges or universities. Nevertheless independent institutions are realizing more than ever before the disadvantages of working without university privileges and tend more and more toward university connections or university relations.

Scholarships.—Theological seminaries, when not endowed, are supported by funds from the denominations they represent. Tuition is generally free, and in many cases board and lodging are furnished. Additional help is given usually when needed, and generous scholarships are the rule. In other professional schools scholarships are comparatively rare. The latest United States education report gives 40 law school scholarships and 295 medical school scholarships. The largest, offered by College of Physicians and Surgeons, New York, pays \$700 a year and is bestowed to promote the discovery of new facts in medical science.

An examination of 82 law school catalogues shows that 48 scholarships are offered definitely. Tuition is free at the law department of Howard University, the law departments of the universities of Kansas, Texas, and West Virginia. The Harvard law school and the Boston University law school offer a "limited number of free scholarships." Law students may compete for the 150 State scholarships and the 18 university scholarships offered annually at Cornell and for the 50 city scholarships offered by the University of Pennsylvania. The law department of Centre College offers free tuition to sons of ministers and to all young men of limited means and good character. Three schools give fellowships annually as follows: New York Law School, 1 at \$500 a year, good for from one to three years; law department University of Pennsylvania, 1 at \$300, good for one year; Pittsburg Law School, 1 at \$250, good for one year. Thirty-two schools offer cash prizes amounting to \$3,010 and law and reference books as other prizes.

One hundred and fifty-one medical school catalogues report definitely only 152 scholarships and 11 fellowships. These are offered by 31 schools. Five other schools refer indefinitely to scholarships. At Cornell and the University of Pennsylvania medical students may compete for State and university, or city scholarships on an equal footing with those who would enter other departments. Tuition is free at the Army

EDUCATION

Medical School, the medical department of the University of Texas, and the medical preparatory school of the University of Kansas. Nineteen schools give cash prizes amounting to \$5,685; 57 offer hospital appointments as prizes; 47 give gold medals, surgical instruments, and other prizes.

Fifty-six dental school catalogues show that 7 schools offer 58 scholarships. The dental department of the University of Maryland deducts one half from tuition fees of one student from each State on recommendation of his State dental society. The Baltimore College of Dental Surgery had similar beneficiary scholarships till 1898 when they were abolished. Eighteen schools offer prizes but their value is not great.

Fifty-two catalogues of schools of pharmacy show that 5 schools offer 12 scholarships and 2 fellowships. Tuition is free at the schools of pharmacy connected with the Alabama Polytechnic Institute, Washington Agricultural College, Purdue University, and the universities of Kansas, Ohio, Oklahoma, Texas, Washington, and Wisconsin. Fifteen schools offer prizes, usually medals or pharmaceutical instruments. Five of these 15 schools give cash prizes amounting to \$620. The committee on revision of the 'United States Pharmacopœia' has instituted fellowships in the University of Michigan and the University of Wisconsin for the discovery of new facts in pharmacy.

Sixteen veterinary school catalogues show that 19 scholarships are offered at 5 schools, that 1 school gives a fellowship and that 6 schools offer prizes. Tuition is free at the veterinary departments of Cornell and Ohio universities, and of Washington Agricultural College. Cornell opens to competition by veterinary students 18 scholarships and to veterinary graduates a fellowship of an annual value of \$500. Veterinary matriculates are eligible for 50 city scholarships offered by the University of Pennsylvania. The veterinary department of Ohio State University offers a scholarship in each county in which the agricultural scholarship is not taken.

Fees.—Tuition is free in 132 theological schools. Only 8 have matriculation fees, 33 a course fee, and 34 other fees. The average matriculation fee is \$5.38, the average course fee \$91.61, the average of other fees \$22.06.

Tuition is free in 4 law schools; 23 have matriculation fees (average \$14), 83 have course fees (average \$69.80), 59 have other fees (average \$10.86).

Tuition is free in 3 medical schools; 119 have matriculation fees (average \$10.68), 153 have course fees (average \$82.39), 129 have other fees (average \$49.47).

Tuition is not free in any dental school; 40 have matriculation fees (average \$8.62), 56 have course fees (average \$94.32), 5 have other fees (average \$33.48).

Tuition is free in 9 schools of pharmacy; 28 have matriculation fees (average \$8.07); 43 have course fees (average \$58.90), 50 have other fees (average \$37.90).

Tuition is free in 3 veterinary medical schools; 7 have matriculation fees (average \$7.85), 14 have course fees (average \$81.28), 12 have other fees (average \$43.50).

Libraries.—In 1904 the United States commissioner of education reported 1,534,486 vol-

umes in libraries of theological schools, 473,771 in libraries of law schools, 220,822 in libraries of medical schools, 9,171 in libraries of dental schools, 44,705 in schools of pharmacy libraries.

Endowments.—The report (1904) of the commissioner of education gives the following figures:

CLASS OF SCHOOL	Endowment funds	Benefactions received during the year
Theological.....	\$21,422,322	\$1,092,645
Law.....	1,447,300	13,550
Medical.....	1,695,416	376,755
Dental.....		1,000
Pharmaceutical.....	23,279	8,021
Veterinary.....		103,000

Value of Grounds and Buildings.—In 1904 the following figures were given, showing the value of grounds and buildings of professional schools:

Theological.....	\$14,304,414
Law.....	2,461,500
Medical.....	13,989,263
Dental.....	1,250,256
Pharmaceutical.....	852,742
Veterinary.....	166,500

The following report the greatest values in grounds and buildings.

Theology

General Theological Seminary, Protestant Episcopal.....	\$1,742,000
St. Joseph's Seminary, Roman Catholic.....	1,000,000
McCormick Theological Seminary, Presbyterian.....	1,000,000

Law

University of Pennsylvania, law department....	\$500,000
University of Chicago, law department.....	320,000
Boston University Law School.....	250,000

Medicine

Cornell University, Medical College.....	\$1,100,000
Hahnemann Medical College, Philadelphia.....	1,000,000
Jefferson Medical College.....	600,000
University of Pennsylvania, Department of Medicine.....	540,656
University of Illinois, College of Physicians and Surgeons.....	520,000
University and Bellevue Medical College, New York.....	518,852
Washington University, medical department...	500,000
Cooper Medical College.....	500,000
George Washington University, Department of Medicine.....	403,195

Dentistry

Baltimore Medical College, dental department..	200,000
Tufts College Dental School.....	200,000
Philadelphia Dental College.....	130,000
New York College of Dentistry.....	120,000

Pharmacy

Philadelphia College of Pharmacy.....	250,000
New York College of Pharmacy.....	204,242

When grounds and buildings are used for several departments, as for example the Columbia Law School which is in the library building, values are not always reported.

Receipts and Expenditures.—The latest reports available for 1903-4 give only a partial report of income as follows:

CLASS OF SCHOOL	No. of Schools	Income
Theological.....	153	\$1,069,600
Law.....	45	364,618
Medical.....	152	1,318,570
Dental.....	54	205,956
Pharmaceutical.....	63	182,437
Veterinary.....	11	48,087
Totals.....	528	\$3,279,358

EDUCATION

Women as Professional Students.—The 1901 United States education report shows that women now appear as students in professional schools of each class except those in veterinary medicine. In nursing they are of course in a large majority, 10,292 as compared with 1,307 men. In the other professions they are reported as follows: Theology, 181, law 170, medicine 1,219, dentistry 166, pharmacy 206. The proportion of women in regular medical schools is much smaller than in homœopathic, eclectic, and physiomedical schools, showing that women prefer the medical sects.

See DENTISTRY; EDUCATION; LAW; MEDICINE; NURSES, *Trained*; PHARMACY; THEOLOGY; VETERINARY; WOMEN, EDUCATION OF.

Power to Confer Degrees.—Low standards in many professional schools are due to a failure to subject the degree-conferring power to strict State supervision. In New York and Pennsylvania the laws now prevent an abuse of the power to confer degrees. In Massachusetts and Vermont bodies formed under the general corporation acts are prohibited from conferring degrees. In Ohio and Nebraska the statutes require only the nominal endowment of \$5,000 for a degree-conferring institution. In other States and Territories as a rule any body of men may form an educational corporation with power to confer degrees "without any guaranty whatever that the privilege will not be abused." This matter has been under discussion recently in various educational bodies and there is a strong sentiment in favor of a strict supervision by the State of the degree-conferring power.

Bibliography.—It is impossible to give more than a brief outline of professional education in the United States. For detailed information touching laws, regulations, location of schools, and courses of study the reader is referred to 'Professional Education in the United States,' published by the University of the State of New York. Of the many authorities the following are most helpful: United States education reports; Eliot, 'Educational Reform'; United States census reports; Briggs, 'Theological Education, and Its Needs'; Dyer, 'Theological Education in America'; Jessup, 'Legal Education in New York'; Wellman, 'Admission to the Bar'; Hammond, 'American Law Schools, Past and Future'; reports of the American Bar Association; Toner, 'Annals of Medical Progress in the United States'; Davis, 'Medical Education and Medical Institutions in the United States'; Journal American Medical Association; Shepard, 'Inaugural Address at the World's Columbian Dental Congress'; 'Proceedings of the American Pharmaceutical Association.'

JAMES RUSSELL PARSONS,

Formerly of the Univ. of the State of New York.

Education, Roman Catholic, in America.

The educational work conducted under the auspices of the Roman Catholic church in the United States embraces all grades of institutions, from the kindergarten to the university. The official figures for the year 1903 show 4,001 parishes with parochial schools, 646 academies and high schools for girls, 179 colleges for boys, and 7 universities. At least four of these universities, by reason of their collegiate and professional courses, deserve to rank as universities, in the proper acceptance of the term. At the head of the Catholic school system is the Catho-

lic University of America, Washington, D. C., established canonically by Pope Leo XIII., 10 April 1887, and incorporated the same year under the laws of the District of Columbia, with Rt. Rev. John J. Keane, S. T. D., as rector.

About one hundred religious teaching orders of men and women and select bodies of the diocesan clergy conduct this work, with a variety of methods and courses of study, but with a unity of purpose to impart a thorough Christian education to the Catholic youth of the country. In the secular studies, the curricula of schools, academies, colleges, and universities do not differ materially from those that obtain in other American schools. In many instances they are recognized by city or state departments of public instruction, and prepare the students for entrance into the higher public institutions of learning. Throughout all schools and grades the study and practice of the Catholic religion are made important; indeed, it is this solicitude of the church for the influence of Christian faith and morals upon the conscience and character of youth that has called forth and maintains, at immense cost and sacrifice, these thousands of Catholic schools. The Catholic Church considers the Christian religion essentially requisite for shaping the character and regulating the life of her youth, and therefore insists upon its action in her schools, to develop a sense of Christian duty, of obligation, of right and wrong, in conscience and before God. The aim of the church and its attitude toward State schools, wherein the teaching of religion is prohibited, are clearly set forth in the pastoral letter of the American bishops of the Third Plenary Council:

Reason and experience are forcing all Christian denominations to recognize that the only practical way to secure a Christian people, is to give the youth a Christian education. The avowed enemies of Christianity in some European countries are banishing religion from the schools, in order to eliminate it gradually from among the people. In this they are logical, and we may well profit by the lesson. Hence the cry for Christian education is going up from all religious bodies throughout the land. And this is no narrowness nor "sectarianism" on their part; it is an honest and logical endeavor to preserve Christian truth and morality among the people by fostering religion in the young. Nor is it any antagonism to the State; on the contrary, it is an honest endeavor to give to the State better citizens, by making them better Christians. The friends of Christian education do not condemn the State for not imparting religious instruction in the public schools as they are now organized; because they well know it does not lie within the province of the State to teach religion. They simply follow their conscience by sending their children to denominational schools, where religion can have its rightful place and influence.

Catholic Secondary Schools.—There is no single, organized system of Catholic secondary schools in the United States. Between the parish school system, now fairly well organized in most dioceses with school superintendents, courses of study, grading of classes, etc., and the university at Washington, there is no uniform plan of intermediate studies. Each secondary school and college is a law unto itself respecting entrance requirements, length and character of courses, and standards for graduation, except in so far as these are regulated by the chartering power under which degrees or honors are conferred. Nor are there any free, endowed Catholic secondary schools besides the Boys' Catholic High School, Philadelphia, founded by the late Mr. Cahill, and the Creighton University, Omaha, Neb., founded by John A. Creigh-

EDUCATION

ton. The secondary schools that do exist are maintained by the teaching orders, mainly through the tuition fees of the students. Living a community life and working without salary, these teachers have been enabled to accomplish much with inadequate resources, and their contribution to the church's educational work in the United States is beyond reckoning. Were it not for their self-sacrifice and devotion to the cause of education, the American Catholic youth would have scarcely any means of prosecuting the higher studies under Catholic auspices. Within the past 10 years efforts have been made with success in several dioceses to secure the foundation of free scholarships for ambitious and deserving graduates of the parish schools.

Academies and High Schools.—Under this heading are included the convent schools for girls, manual and industrial training schools for boys, commercial and high schools for both sexes. The elementary course of eight years is supplemented by a course varying from one to four years, in the higher studies of English, languages, science, mathematics, history, commercial studies, art and music, and Christian ethics. Last year there were 646 academies for girls with an attendance of about 25,000.

The manual and industrial training schools are not so numerous, but with the growing demand for artistic work in the trades, each year marks the opening of new trade schools. The Catholic High School, Philadelphia, and the Papal College Josephinum, Columbus, Ohio, are noted for their excellent work. Commercial schools for boys are found in every large city as preparatory schools for those intending a business career. Many parish schools give post-graduate courses in commercial law, bookkeeping and typewriting, and might properly be classed with secondary schools. For some time there has been a tendency to advance the larger parish schools beyond the studies of the grammar grades. One or more advanced classes are devoted to secondary work. At present there are about 50 of these in the larger cities, with an attendance of 450 boys and 750 girls. These figures are not large but they are significant of a growing demand for the advantages of Catholic secondary education.

Less than half of these Catholic academies have reported statistics to the United States Commissioner of Education. Of the 1835 private secondary schools reporting to the Commissioner, religious denominations control 923. Of the latter, the Catholic Church maintains 369, with 1,046 instructors, and 16,786 students, distributed as follows:

	Schools	Instructors	Students
North Atlantic States....	99	556	5,385
South Atlantic States....	35	163	1,227
South Central States....	53	268	2,485
North Central States....	116	675	5,426
Western States	66	284	2,263

History.—One of the first high schools for boys in the United States was the classical school founded in 1682 by the Jesuits, in that part of New York city known as "Bowling Green," near the Battery. It was patronized by Gov. Thomas Dongan and by the best Protestant families of the time. Later it had to be closed owing to attacks of bigotry, rampant in that age, but in 1808, Father Antony Kohlmann, administrator of the diocese, bought ground for a new school, in front of the old cathedral. It was opened with

one priest, and four scholastics, and had 35 pupils. A few years after it moved to the site of the present Cathedral, and developed into the diocesan seminary. Among the earliest American academies for girls was the pioneer Ursuline Academy in Canada, founded by Madame de la Peltrie, in 1652. The original building forms the centre of that group which to-day constitutes the Ursuline Convent, Quebec. The first band of Ursulines in the United States reached New Orleans in 1727, and established on August 7, that year, what is probably the first high school for girls in this country. In 1808 Ursulines from Ireland opened an academy in New York city, but failing to receive vocations to the Order, they returned home. In 1820, the historic Ursuline school at Charlestown, Mass., was opened, and at once attracted attention for the excellence of its work. It is said that four fifths of its pupils were from the most distinguished Protestant families of New England. The Visitation Nuns began their educational work in the United States at Georgetown, D. C., in 1799. The saintly Mother Eliza Anne Seton, a convert to the Catholic faith, established in 1809 at Emmetsburg, Md., the Sisters of Charity of Saint Joseph. In 1812, at Nazareth, Ky., a few pious ladies founded the Sisters of Charity of Nazareth, with Mother Catharine Spalding, the first superioress, and in 1818 the Ladies of the Sacred Heart came to the United States, when Madame Duchesne opened a convent at Saint Charles, Mo. Since then other Orders from the old world came here to organize and conduct schools and at least 20 more are original American foundations.

Catholic Colleges.—These may be classified as classical, commercial, and a combination of both. They arose to meet the demand for higher education by those destined for the priesthood, the learned professions, and business careers. The tendency to-day is to eliminate the commercial department from the colleges, and thus make them strictly classical and scientific. The Christian Brothers, who had attained distinction in the teaching of the classics, have returned to their primitive rule which forbade this teaching, and are now making a specialty in their colleges of the modern languages, pedagogy and applied science. Excepting Creighton College, Omaha, Neb., there is no free, endowed Catholic college in the United States. Tuition fees have been the main source of revenue; benefactions and endowments have been a rarity; not one Catholic institution appears on last year's list of notable benefactions to American colleges. Lack of funds has hampered many of the colleges in extending the field of their labors and in undertaking many modern methods and improvements. No uniform, definite standard obtains for entrance. In the East an increasing number conform to the requirements of the Regents of the University of New York, or to the regulations of "The Association of Colleges and Preparatory Schools in the Middle States and Maryland." Under the guidance of Rt. Rev. Mgr. Thomas J. Conaty, D. D., rector of the Catholic University, the representatives of 53 Catholic colleges assembled in Chicago in 1899, and organized "The Association of Catholic Colleges of the United States." The purposes of the association are to study the questions connected with college education, to advance the unification of sys-

EDUCATION

tems of Catholic education, and to strive toward a larger development of college work. The Association meets at an annual conference, the report of which is published at the Catholic University. Its organization was perhaps the most important step taken in Catholic higher education since the establishment of the Catholic University.

The colleges are conducted chiefly by the religious teaching orders of men, as follows: Augustinians, 2; Benedictines, 18; Capuchins, 2; Carmelites, 1; Order of Charity, 1; Christian Brothers, 6; Franciscans, 5; Franciscan Brothers, 1; Holy Cross, 5; Holy Ghost, 1; Jesuits, 24; Marists, 5; Society of Mary, 4; Precious Blood, 1; Brothers of the Sacred Heart, 4; Saint Viator, 1; Vincentians, 2; Zaverian Brothers, 3. Not all of these are reported by the United States Commissioner of Education. In the 60 colleges for which statistics are given, there were (1902-3) 1,375 instructors and an attendance of 14,158 students.

Colleges for Women.—The Catholic Church has ever been solicitous to foster the higher education of women, but on lines that will conserve the graces and promote the ideals of true Christian womanhood. The Ursulines and the Ladies of the Sacred Heart conduct several collegiate schools. At Govanstown, Md., the School Sisters of Notre Dame maintain a promising college. Saint Mary's, Notre Dame, Ind., Sisters of the Holy Cross, was founded in 1855 to provide for the highest education as rapidly as means would allow. This is probably the first legally authorized Catholic college for women in the United States, its charter from the Indiana legislature dating back to the year of foundation. The new Collegiate Hall was opened last year. The College of Saint Elizabeth, formerly known as the Academy, Convent Station, N. J., was founded in 1859 and is in charge of the Sisters of Charity. It is chartered under the laws of New Jersey to confer degrees, and is registered by the N. Y. Board of Regents. Its physical and chemical laboratories are splendidly equipped with all modern appliances for advanced work in all the college departments. Saint Mary's-of-the-Woods, Saint Mary's, Ind., was established by the Sisters of Providence, in 1840, and for some years has been empowered to confer academic honors and collegiate degrees. Trinity College, Washington, D. C., in the immediate vicinity of the Catholic University, was organized in 1901 by the Sisters of Notre Dame of Namur, and is strictly a post-graduate college. It is a woman's college of the same grade as Vassar, thus giving Catholic women an opportunity for receiving the highest collegiate instruction.

Universities.—Among the Catholic institutions of highest education are the universities of Georgetown, Notre Dame, Creighton, and the Catholic University of America. Saint John's College, Fordham, N. Y., founded in 1841, announces that it will branch out as a university this year, when a medical college will be opened, affiliated in a clinical way with a new hospital in course of erection near by. The oldest Catholic university in the United States is Georgetown, District of Columbia, founded in 1789. It contains a graduate school, collegiate, law, medical and preparatory departments, and an astronomical observatory. The Jesuit Fathers conduct it.

Notre Dame University, Saint Joseph County, Ind., was established 1842 by the Very Rev. Edward Sorin, C. S. C. It has thirteen full collegiate courses, besides excellent courses in art and music. The Creighton University, Omaha, Neb., founded by John A. Creighton and endowed as a free college, was opened in 1879, in charge of the Jesuits. It includes Creighton College, a free, classical day college, and the Creighton Medical College (1892), with a clinic in The Creighton Memorial Saint Joseph's Hospital. The Catholic University of America, Washington, D. C., was established by the American bishops through the munificence of Miss Mary Gwendolin Caldwell. It was solemnly opened 13 Nov. 1889, as the highest seat of learning of the Catholic Church in the United States. By the terms of its Constitutions "the courses of study shall be such in quality and grade as befit a real university." Under the Faculties of theology, philosophy, and law, and the Board of Instruction of Technology are maintained twenty-five departments of university study. The University Colleges, managed by officers under rules laid down by the Board of Trustees, of which His Eminence James Cardinal Gibbons is president, are Divinity College, or Caldwell Hall, and Keane College, named in honor of the University's first Rector, Most Rev. Archbishop John J. Keane, Dubuque, Iowa. Affiliated with the University and grouped about it are Saint Thomas' College (Paulists), Marist College (Society of Mary), Holy Cross College (Fathers of the Holy Cross), College of the Holy Land (Franciscans), Saint Austin's College (Sulpicians), and the Apostolic Mission House (Catholic Missionary Union). Saint Paul's Seminary, Saint Paul, Minn., is also an affiliated college. McMahon Hall, named in honor of the late Mgr. James McMahon, who founded it, contains the chief lecture halls and laboratories. Among the University publications are the 'Catholic University Bulletin,' published quarterly; 'Pittonia,' a series of papers relating to botany; and the 'Year Book,' published annually in April.

Normal Schools.—The religious orders of men and women devoted to educational work prepare their novices at their respective mother-houses, which are normal schools, with more or less full courses in pedagogy. Many of these are distinct buildings, equipped with the best appliances used in modern training schools for teachers. The normal institutes of the Christian Brothers at Amawalk and Ammendale, of the Notre Dame Sisters at Waltham, Mass., and San Jose, Cal., and of the Marist Brothers at Dayton, Ohio, are model institutions. In the United States Commissioner's report are the statistics of twelve others, in which the curriculum of normal studies is followed by 215 students. In 1873 Mother Angela, Sisters of the Holy Cross, Notre Dame, Ind., established Saint Catharine's Normal School, at Baltimore, Md. This was the first Catholic Normal school for women in the United States. Its course of study has always been in accord with the best pedagogic methods. Of late years the Jesuits and the Christian Brothers have conducted special pedagogical departments in most of their colleges. In October 1903, the Catholic University opened in New York city an Institute of Pedagogy, where its professors give graduate courses in psychology, logic and ethics, principles,

EDUCATION

methods, and history of education, American history, and library work.

Catholic Reading Circles.—The first Catholic reading circle was begun by Warren E. Mosher, in Youngstown, Ohio, in 1889. He also founded and edited the 'Catholic Reading Circle Review,' the monthly organ of the Catholic Educational Union. Under the name of the 'Champlain Educator,' the Review is now the official organ of the Catholic Summer School of America. The same year the Paulist Fathers (N. Y.) established the Columbian Reading Union, with a department in the 'Catholic World Magazine.' Under the Catholic Educational Union, 200 reading circles are organized, with a membership of 6,000; in the Columbian Reading Union are 150 reading circles, with a membership of more than 5,000. The most far-reaching and progressive outgrowth of the movement has been the University extension work through the Catholic Summer and Winter Schools, organized on the well-known Chautauqua plan. The parent Catholic Summer school was established at New London, Conn., in 1892. A year later permanent grounds consisting of 500 acres were secured at Cliff Haven, on the west bank of Lake Champlain. In 1903, 6,000 people were in attendance. The investments of the Catholic Summer School of America represent over \$400,000. The lecture courses embrace literature, art, science, pedagogy, history, philosophy, music, physical culture, and ethics. The New York State Department of Public Instruction has established the Summer School as a summer institute for teachers, and the course in pedagogy qualifies for promotion before the Board of Education, New York city. In 1895 a similar organization was effected in the Middle West, at Madison, Wis., where the successful Columbian Catholic Summer School holds its sessions. The Catholics of the South in 1896 opened a Catholic Winter School in New Orleans, where its annual session opens each year after the Mardi Gras celebration. San Francisco also has its Catholic Winter School, and at Emmetsburg, Md., have been held annual sessions of the Maryland Catholic Summer School.

Education, Scientific and Technical. The opening for the founding of the modern scientific or engineering college was in a large measure made by Archimedes, Galileo, Bacon, Kepler, Newton, and others, whose creation of exact science made possible the study of applied science, and the wonderful growth and development of such schools, in which the applications of scientific discovery might be taught, has practically all been witnessed since the last half of the 19th century.

Industrial and economic conditions had much to do with the founding of such schools in certain localities; for example, the famous School of Mines at Freiburg, and to this same class belong many of the earlier European schools. These schools have been the models after which the schools of the United States have been patterned, but still the individuality and great advances made in the schools of the United States in the direction of scientific and technical education are of great interest to educators throughout the world.

Scientific and technical schools may be divided into three groups: (1) those schools which teach science and technology exclusively, and which are independent of and free from all State or government control and which oftentimes rely for their income upon the endowment of a single person; (2) those schools, not under State or government control, which are affiliated with some college or university, and whose work is largely individualized, often having no separate faculty or organization and sometimes wholly supported by the income derived from separate endowments and their own tuition fees; (3) those schools which derive a large portion of, if not all, their support from State or government.

The organization, courses of study, and degrees conferred by such schools are materially the same; all courses are four years in length, the first two preparatory to the last two, embracing the usual subjects, such as modern languages, mathematics, etc., the junior year generally marking the point at which the differentiation begins; the degree almost universally conferred is B.S., but some few also grant the degrees of C.E., M.E., etc.

The respect for exact scholarship and the regard for scientific truth make schools of engineering and technology more than a means toward riches; they instill into the mind of the student a regard for his duty as a citizen, and cultivate a thorough responsibility and accuracy of judgment as well as disciplined, intellectual, and independent thought. See EDUCATION, ENGINEERING; MANUAL TRAINING; ARMOUR INSTITUTE OF TECHNOLOGY; CASE SCHOOL OF APPLIED SCIENCE; CHANDLER SCHOOL OF SCIENCE; COLUMBIA UNIVERSITY, *School of Mines*; LAWRENCE SCIENTIFIC SCHOOL; LEHIGH UNIVERSITY; MASS. INSTITUTE OF TECHNOLOGY; POLYTECHNIC INSTITUTE OF BROOKLYN; ROSE POLYTECHNIC INSTITUTE; SHEFFIELD SCIENTIFIC SCHOOL; STEVENS INSTITUTE OF TECHNOLOGY; VAN RENSSELAER POLYTECHNIC INSTITUTE; WORCESTER POLYTECHNIC INSTITUTE; and articles on the various State universities, nearly all of which give instruction in applied science.

Education, Secondary, in America. The history of American secondary education presents three stages of development. First, the colonial period, with its Latin grammar schools; secondly, the period extending from the Revolutionary War to the middle of the 19th century, with the "academy" and, thirdly, the period down to the present, chiefly characterized by the growth of public high schools.

The influences which most vitally affected the early development of secondary education in America were the example of the "grammar schools" of England and the rising spirit of democracy, which was largely Calvinistic in its

EDUCATION

modes of thought, and kept in touch with Calvinistic portions of Europe.

Early in the history of the colony of Virginia, funds were raised and lands set apart for the endowment of a Latin grammar school. But these promising beginnings were swept away by the Indian massacre of 1622, and the school seems never to have been opened. The town of Boston, in the Massachusetts Bay Colony, set up a Latin school in 1635, which has had a continuous existence down to the present time. This school was established by vote of the citizens in a town meeting. It was supported by private donations and by the rent of certain islands in the harbor, designated by the town for that purpose; a town rate seems to have been levied when necessary to make up a salary of \$244.50 a year for the master. Other Massachusetts towns followed the example of Boston. School fees were commonly collected. A town rate, which was depended upon at first only to supplement other sources of revenue, gradually came to be the main reliance; and by the middle of the 18th century most of the grammar schools of Massachusetts charged no fee for tuition. Latin schools were early established in Connecticut; one at New Haven in 1641, and one at Hartford not later than 1642. A notable bequest of Edward Hopkins, sometime governor of Connecticut Colony, available soon after the middle of the 17th century, was devoted mostly to the maintenance of Latin grammar schools in Hartford and New Haven, and also in the towns of Hadley and Cambridge in Massachusetts. The Dutch at New Amsterdam opened a Latin school in 1659, continued for some years after the colony passed under English rule. Secondary schools were established in Pennsylvania in the latter part of the 17th century. One of these, the William Penn Charter School at Philadelphia, has continued down to the present day. King William's school at Annapolis was erected by the legislature of Maryland in 1696, and similar schools were established in different sections of the same colony. The 18th century saw schools of like character opened, partly by legislative enactment, partly by private initiative, in these and in the remaining colonies. Some of the number, like the University Grammar School in Rhode Island and the Free School at New York, were fore-runners of the accompaniments of colonial colleges. In the organization of colonial systems of secondary education important beginnings were made. In 1647 the colonial legislature of Massachusetts decreed that an elementary school should be maintained in every town of 50 families; and that in every town of 100 families there should be a grammar school, in which students might be fitted for the university. This provision was copied by the colonies of Connecticut and New Hampshire, and in Connecticut the provision was afterward changed to require a grammar school in each county town. These New England colonies maintained and enforced such provisions down to and after the Revolution. Maryland also established by law a system of county grammar schools. When the colonies were transformed into States, after the Declaration of Independence, the systems of schools in the four colonies mentioned were continued with little change, but no other of the 13 States had anything that could be called a system of public instruction.

The chief emphasis in these colonial schools was laid on preparation for the college entrance examination, and the requirements for admission to college determined their course of study. The colonial grammar schools accordingly taught Latin, a little Greek, religion, and little else.

Both grammar schools and colleges were intended especially for the directive and professional classes, and had little connection with such elementary schools as there were. In Massachusetts, towns which maintained grammar schools were not required to maintain reading schools. Sometimes pupils were taught to read in grammar schools. But the grammar school teachers objected to this burden; and the mixing of the two grades of instruction in one school was recognized as an evil. The grammar schools exercised a kind of selective function, discovering latent capacity for the higher studies and starting talented youth on the way to college. Those who showed capacity of a lower grade or of a different sort received little attention or encouragement.

As we approach the Revolutionary period, we find new social conditions giving rise to a new order of schools. With the growth of sectarian differences, there appeared a decided tendency toward the separation of governmental from ecclesiastical affairs, and thus the position of educational institutions was disturbed. This change lessened the prestige of colonial systems of education among the adherents of the religious denominations, and a growing distrust of the colleges appeared among those who were most in accord with the secularizing tendency of the time. The old grammar schools were weakened by these influences, and in their stead there grew up a new type of secondary school, commonly known as the academy.

Both the name and the character of the new institution were suggested by precedents in England, where Dissenters were excluded from grammar schools and universities. In the latter part of the 17th century the non-conformist bodies first established "academies," schools in the main of secondary grade, which, however, undertook to prepare candidates for the non-conformist ministry.

The fame of the English academies seems to have influenced the thought of the American colonists in the matter of public education; first the strong theological bent of their English prototypes reappeared in the new American schools; and then the resemblance was more obvious in the wide range of studies offered, for the English academy had been more practical and technical than the university. But the American academies soon came to have a well-defined character of their own, apart from any conscious imitation of English models.

In 1726, a school for classical and theological studies was established by a Presbyterian minister at Neshaminy, in Pennsylvania. It was commonly known as the "Log College," as its home was a building made of logs. This school in the wilderness was the centre of deep and widespread interest in classical studies as well as in the religious life. It sent out large numbers of zealous pastors and teachers, who established "log colleges" all over the highlands of the middle and southern colonies. The Neshaminy Log College itself was later incorporated with what is now Princeton University.

EDUCATION

Through the efforts of Benjamin Franklin, a school was established at Philadelphia, legally incorporated as an academy in 1753, and probably the first institution in America formally designated by that title. It was under the control of a self-perpetuating board of trustees. A fund raised by private subscription for its establishment and maintenance, was supplemented by a grant from the city treasury and by tuition fees, which were remitted in the case of those unable to pay. This academy organized in three departments or schools; namely, the Latin, the English, and the mathematical, put little stress on the theological element and much on English language and literature, and the mathematical sciences. The school ultimately developed into the University of Pennsylvania. Within two or three decades after the founding of this school at Philadelphia, a number of schools somewhat similar in character, and some of them bearing the name academy, were established in the middle and southern colonies. In New England the two Phillips academies, one at Andover in Massachusetts and the other at Exeter in New Hampshire were incorporated in 1780 and in 1781, respectively. The influence of these two schools extended to remote States, especially in the growing West; and they still rank among the strongest and most influential secondary schools.

Soon after the close of the Revolutionary War, new State systems of education began to be established, in which special provision was made for secondary schools. The University of the State of New York, erected in 1784, is a notable example of the strong influence which French thought then exercised in American affairs, as it realized the conception of a university put forth by Diderot and others of the great French writers of the latter half of the 18th century. It embraced the whole provision for secondary and higher education within the State, with the exception of schools of a purely private character. Its control was vested in a board of regents, consisting of the governor and the lieutenant-governor, *ex officio*, and 19 members elected by the State legislature. The reorganization of 1787 accordingly made the board of regents distinct from the board of trustees of Columbia College, with which it had been identical. This "university" exercised great influence on later systems; and in Georgia, by an Act, passed in 1785: "All public schools instituted, or to be supported by funds or public moneys in this State, shall be considered as parts or members of the university"; and in the territory of Michigan, an act was passed in 1817 instituting a university of imposing character. The latter establishment existed mainly on paper, and the act incorporating it was repealed in 1821. The Georgia "university" also never amounted to much. But although the comprehensive type of university organization was not widely adopted, there was a general desire in the early part of the 19th century to establish complete and well-rounded systems of public instruction. The legislature of Tennessee declared in 1817 that, "Institutions of learning, both academies and colleges, should ever be under the fostering care of this legislature, and in their connection with each other form a complete system of education." Even more significant is the provision of the constitution of Indiana, adopted in 1816, that, "It shall be

the duty of the general assembly, as soon as circumstances will permit, to provide by law for a general system of education, ascending in regular gradation from township schools to a State university wherein tuition shall be gratis and equally open to all." For the most part, however, actual State agency in secondary education was as yet limited to the subsidizing of privately managed academies. In Massachusetts, the provision for grammar schools under town control was continued after the colony became a State, but the law was so changed that only the larger towns were left subject to this requirement. At the same time academies established by private initiative were endowed by the legislature with grants of public lands. In Kentucky, the State legislature granted 6,000 acres of public lands to an academy in each county. In Pennsylvania, colleges and academies received financial aid from the State for many years, culminating in 1838 in a general State system of educational subsidies. Five years later, such aid was discontinued. In other States, the granting of State subsidies, in money or in lands, to secondary and higher schools, was customary for many years. For the most part, there is but little system or consistency observable in the distribution of such aid; and the State-aided institutions were not subjected to any sort of State control.

The type of secondary school which grew up under these conditions demands closer consideration. The old academies were generally endowed institutions, organized under the control of self-perpetuating boards of trustees or of religious bodies, established to serve the need of a wide constituency and not merely of a single community, and often located in small country places. Many of them made provision for boarders as well as for day pupils. They were not intended in any exclusive sense for the training of future members of the learned professions, although many of them developed into preparatory schools. In the western States preparatory schools attached to colleges were commonly called "academies." But such was not the earlier purpose of the academies, which were largely schools for the middle classes, and answered to a growing desire after learning for its own sake, or for the increased efficiency it would give in other than professional pursuits.

Their training was more "practical" than that of the colleges, wider and more liberal than that of the grammar schools, or of some of the colleges. They laid new stress on the study of the English language, together with grammar, rhetoric, and public speaking. They taught mathematics, often including surveying and navigation; began the study of natural science, especially of natural philosophy (physics), of which astronomy constituted an important division; gave courses in geography, ancient history, English and above all American history. French often and German seldom. Latin and Greek were the substantial core of the instruction offered. In the earlier days, the course of study was not well defined. In English, Latin, and mathematics, a good degree of continuity of work was apparently maintained, but in others, classes were formed at irregular periods, because of the exigencies of rural life which demanded that certain courses be confined to a short winter term not interfering with farm labor. When finally definite courses of study

EDUCATION

were laid out, they varied in length from three to four or five years. Parallel courses were offered. That including classical studies and covering the required preparation for admission to some college was commonly regarded as the standard course of the school. With this might be found an English course. Afterward a scientific course was often provided.

Many of these schools were established by religious bodies. Catholic secondary schools began to appear in this period, established by the several teaching orders. The Society of Jesus founded institutions of secondary and higher education in the United States after the Revolutionary War; the Brothers of the Christian Schools opened their first school in America at Montreal in 1838; soon after set up establishments within the United States, at Baltimore and New York, and followed these elementary schools with secondary courses; and besides many conventual schools for girls were established, which drew a large clientage from other than Catholic families. The academies established by Protestant bodies usually terminated their formal connection with ecclesiastical societies upon their legal incorporation. The religious instruction which they carried on concerned itself for the most part with the broad underlying principles of Christianity, so that the non-Catholic academies, even such as had arisen from the initiative of religious societies, tended toward the non-sectarian character which has been more fully exemplified in the public schools of later times.

The grammar schools had been exclusively for boys. Such was the case with many of the academies. But others were coeducational, and there grew up also a large number of academies for girls, which were all too often weighed down with the title of "female seminary." The last two prepared the way for two types in higher education, appearing in the fourth decade of the 19th century, namely, the coeducational college and the college for women exclusively.

The academies broadened the intellectual horizon of families and communities, and reinforced the protest which was arising against the narrow curriculum of the American colleges. In the absence of special schools for the training of teachers, the better elementary schools were for a long time in the hands of academy graduates. Special classes were organized in New York and Pennsylvania academies for instruction in the art of teaching, and a seminary for teachers was opened in connection with the Phillips Academy at Andover. When State normal schools began to be established, in Massachusetts in the year 1839, suggestions for their organization and management were drawn from this seminary and from the current practice of the academies.

In the early part of the 19th century, there appeared a strong demand for schools under the exclusive control of the State. The Calvinistic view of the civil power had apparently prepared the way for State agency in education, and the steadily advancing separation between Church and State kept alive the question as to the relation of the schools to both. The well-established theory that the State should grant charters to colleges, authorizing them to manage their own affairs under close corporations, with incidental aid from the State in the shape of gifts of land or money, was long applied to

secondary education as well. The first step in the establishment of public secondary schools was taken by the larger towns and municipalities, under the lead of Boston, where in 1821 was established an "English classical school," which soon took the name of "English high school," imitating the style of the Edinburgh High School, from which the new Boston school differed in not including the ancient languages in its curriculum, and in not employing the monitorial method of instruction. Its course was three years, embracing English language and literature, mathematics, navigation and surveying, geography, natural philosophy (including astronomy), history, logic, moral and political philosophy. Latin and modern languages were added afterward and the course extended to four years. Students were received into the high school from the elementary schools of the city, but at first were not prepared for admission to college, that being the function of the Latin school. But with the addition of foreign languages to its course of study, the English high school fitted its students for admission to certain higher institutions.

Other Massachusetts towns followed the lead of Boston in this matter. Philadelphia, in 1838, established the Central High School, under special authorization from the Pennsylvania legislature. Baltimore followed, with the establishment of a "city college." Providence opened a public high school in 1843. Hartford, in 1847, transformed her old grammar school into a school of the newer type. New York opened a "free academy" in 1848, the name of which was afterward changed to the College of the City of New York. This school was established in accordance with a special act of the State legislature, ratified by vote of the people of the city. Later growth was rapid and widespread, although the movement encountered hostility from those who regarded the academy as the final or best solution of the problem of public secondary education, and from those who were opposed on principle to the recognition of secondary education as a proper field for governmental agency. The legal questions involved in this latter contention were settled by the supreme court of Michigan, in what is commonly known as the "Kalamazoo case," the decision being: "Neither in our State policy, in our constitution, nor in our laws do we find the primary school districts restricted in the branches of knowledge which their officers may cause to be taught, or the grade of instruction that may be given, if their voters consent, in regular form, to bear the expense and raise the taxes for the purpose."

As early as 1798, Connecticut authorized the opening of higher schools by the local authorities ("school societies"). In Massachusetts, the law requiring grammar schools in the towns was so far weakened, in 1824, that towns having a population of less than 5,000 were allowed to substitute therefor an elementary school. But two years later it was enacted that every town having 500 families should provide a master to give instruction in history of the United States, bookkeeping, geometry, surveying, and algebra; and every town having 4,000 inhabitants, a master capable of giving instruction in Latin and Greek, history, rhetoric, and logic. Iowa adopted a provision in 1849 expressly permitting the adding of higher grades to the public

EDUCATION

schools; and in 1858 authorized the establishment of county high schools. In New York, systematic grading of the schools went steadily forward; and the "academic departments" of these schools, corresponding to the high schools of other States, formed a part of the University of the State of New York and received financial aid from the literature fund. In Maryland, the county academies, which had displaced the grammar schools of colonial days, continued for many years to receive financial aid from the State, and only in comparatively recent times were merged into a State system of high schools.

We have seen that by the middle of the 19th century the academies were now *par excellence* the preparatory schools of the country, and that the growth of high schools had taken away from them the character of the ordinary provision for secondary education. Many of them declined as the high schools advanced; many were given over to the communities in which they were conducted and became high schools, under public management; and those that survived laid more and more stress on their function of preparing for college. While the high schools are for day pupils only, the academies are generally boarding schools. At the first there was an organic connection between the high schools and schools of elementary grade, but a recognized gap between the high schools and institutions of higher learning, the earliest high schools being intended specifically for those who were not preparing for college. But there soon appeared a disposition on the part of the public school authorities to close up this gap, and studies regarded as distinctively preparatory to college were introduced into high school courses.

Even when the high schools had begun to prepare their more favored students for college, the connection between the secondary and the higher institutions was not so close as was desired, because of the inherent differences between the college and the secondary system, especially in the East where few universities were under State control. For a long time the most powerful single agency affecting the course and the methods of instruction in the better high schools, as in the academies, was the entrance examinations of the several colleges.

Thus the college examination became the chief end and aim of much of the work in secondary schools, and there appeared a marked tendency to substitute a cramming process for real educational procedure. The attempt to correct this evil has taken several different directions. One of the earliest and most noteworthy attempts at its solution is the so-called accrediting system, introduced by the University of Michigan in 1871. Under this system, the university admits to its freshman class, without examination, such graduates of approved secondary schools as are especially recommended for that purpose by the principals of those schools. It depends upon a purely voluntary agreement between the secondary schools and the higher institutions, so that the school rather than the individual is examined; and the inquiry relates chiefly to the vitality, intelligence, and general effectiveness of the instruction. The highest grade of efficiency in university inspection is found in such a system as that maintained by the University of California,

where the accrediting of schools is in the charge of a committee of the academic senate, some of whose members visit every year all secondary schools within the State which apply for accrediting.

The purpose of a well-considered accrediting system is not to provide a means whereby applicants for admission to college may escape a dreaded examination, but to encourage and build up strong and efficient schools of secondary grade.

The disadvantages of the system are that it tends to foster a disposition to evade all tests of accurate scholarship in the shape of definite examinations; that it entails a heavy burden upon the higher institution; and demands large expenditures of money and of the time of university instructors. In the University of California, the actual cost in money for the traveling expenses of the inspectors is about equal to the salary of an assistant professor and the aggregate of the time required each year by all departments for the purposes of examination of schools is not far from three full academic years. The accrediting system cannot be regarded as a final solution of the problem with which it deals, but it marks a great advance, and it is safe to say that its present advantages greatly outweigh its obvious disadvantages.

Parallel with the later development of the accrediting system, there have grown up important voluntary associations of instructors, in which representatives of the colleges meet with representatives of the secondary schools for the discussion of topics of common interest. The parent society of this sort is the New England Association of Colleges and Preparatory Schools, organized at Boston in 1885. This organization prompted the establishment of the commission of colleges in New England on admission examinations, which, by its recommendations, has done much to unify requirements for college matriculation.

The Association of Colleges and Preparatory Schools in the Middle States and Maryland came into existence in 1892. The North Central Association of Colleges and Secondary Schools was formed at Evanston, Ill., in 1895; and the Association of Colleges and Preparatory Schools of the Southern States, at Atlanta, Ga., in the same year. State organization somewhat similar in character are found in a number of the States, as in New York, Ohio, Tennessee, Colorado, Michigan, and both Dakotas. These various societies, through their discussions and recommendations, have exercised a vast influence upon the development of our secondary education.

But the chief landmark in the recent history of this grade of school is the work of the Committee on Secondary School Studies, appointed by the National Educational Association in 1892, and commonly known as the "Committee of Ten." This committee was the outcome of a movement within the national association in the direction of uniformity of college entrance requirements. Not limiting itself to the mechanical adjustment of relations between the high school and the college, this committee proceeded to consider the problem of secondary education from an educational point of view. Nine sub-committees of 10 members each were appointed to prepare reports on the several or-

EDUCATION

inary departments of secondary school instruction, namely, Latin, Greek, English, other modern languages, mathematics, physics (with astronomy and chemistry), natural history (biology, including botany, zoology, and physiology), history (with civil government and political economy), and geography (physical geography, geology, and meteorology). The Committee of Ten, having secured carefully prepared reports from its sub-committees, and having examined a large number of the courses in actual use in secondary schools, drew up a report which was published by the United States government in December 1893, together with the reports of the several sub-committees. Great stress was laid on the correlation of studies in secondary schools, the unifying of many subjects into a well-knit course of instruction, through the recognition of their numerous inter-relations. The committee would have continuous instruction in the four main lines of language, mathematics, history, and natural science. In particular, they recommended that in the first two years of a four-year course, each student should enter all of the principal fields of knowledge, in order that he may fairly "exhibit his quality and discover his tastes"; and urge the postponement of the beginning of Greek to the third year, in order that the student may not find himself at the bifurcation of the course into classical and Latin-scientific courses, before he is ready, or his advisers sufficiently informed as to his capabilities, to make an intelligent choice. The committee would require in each course a maximum of 20 recitation periods a week; but they would have five of these periods devoted to unprepared work; and would reserve double periods for laboratory exercises whenever possible. With reference to requirements for admission to college, the committee recommend "that the colleges and scientific schools of the country should accept for admission to appropriate courses of their instruction the attainments of any youth who has passed creditably through a good secondary school course, no matter to what group of subjects he may have mainly devoted himself in the secondary school." "A good secondary school course" they describe as consisting of any group of studies from those considered by the sub-committees, "provided that the sum of the studies in each of the four years amounts to 16, or 18, or 20 periods a week,—as may be thought best,—and provided, further, that in each year at least four of the subjects presented shall have been pursued at least three periods a week, and that at least three of the subjects shall have been pursued three years or more."

Since the early days of the academies, it has been customary in many schools to offer alternative courses; one of them classical, the other "modern." Especially within the last 25 years, there has appeared a strong demand that instead of a choice of courses the students be offered a wide range of choice in particular subjects. Several influences have combined to bring about this demand. Teachers have objected to close prescription in high schools when freedom is increasing in the higher institutions. The conviction that the secondary schools should not be merely tributary to the colleges is gaining ground, and the independence of the secondary school carries with it independent responsibility for the supply of the actual educational needs

of the youth attending such a school. It is urged that, since no two students have exactly the same aptitudes, so far as possible, every student should pursue a different course of instruction from every other student. This doctrine substitutes a quantitative for a qualitative consideration of the curriculum. A high school curriculum, under this system, would consist of a fixed number of units of study, to be chosen at will from the whole number of studies taught in the school. Certain utterances of the Committee of Ten have tended to strengthen this quantitative view of the curriculum. In the attempt to reduce this doctrine to practice, certain modifications necessarily enter. The choice of studies cannot be left simply to the immature pupil. Even if other subjects may be given over to absolute freedom of election, studies in English are found to be indispensable in every course. Little by little, other subjects are acknowledged to be essential; until it appears that there is little difference in practical working between a system of parallel courses rendered flexible by the allowing of occasional substitutions, and an adequately supervised elective system.

The latest attempt at an adjustment of the relations of secondary schools and colleges, to the educational advantage of both, is contained in the report of the Committee on College Entrance Requirements, appointed in 1895 by the National Educational Association, and consisting of 14 members, representing the high schools and universities of different sections of the country, under the chairmanship of the superintendent of high schools of the city of Chicago. The first important service rendered by the committee was the preparation and publication of a table showing the actual entrance requirements of 67 representative colleges, universities, and higher technical schools in the United States. The committee's final report, presented at the meeting of the National Educational Association in July 1899, is mainly devoted to the attempt to establish "national units, or norms," in the several subjects taught in the secondary schools as preparatory to the college course. The fundamental problem "is to formulate courses of study in each of the several subjects of the curriculum which shall be substantially equal in value, the measure of value being both quantity and quality of work done." In the determination of these norms, the committee received assistance from several bodies of expert scholars in the several branches of instruction. The American Philological Association proposed courses of study in Latin and Greek; The Modern Language Association of America rendered a like service with reference to the French and German languages; the American Historical Association and the Chicago section of the American Mathematical Society reported on courses in history and mathematics; and the Department of Natural Science Instruction of the National Educational Association presented recommendations relating to physical geography, chemistry, botany, zoology, and physics. These several supplemental papers are published in connection with the committee's report. The committee adopted 14 resolutions, of which the following are of the greatest general significance:

1. That the principle of election be recognized in secondary schools.

EDUCATION

4. That we favor a unified six-year high school course of study beginning with the seventh grade.

6. That while the committee recognizes as suitable for recommendation by the colleges for admission the several studies enumerated in this report, and while it also recognizes the principal of large liberty to the students in secondary schools, it does not believe in unlimited election, but especially emphasizes the importance of a certain number of constants in all secondary schools and in all requirements for admission to college.

12. That we recommend that any piece of work comprehended within the studies included in this report that has covered at least one year of four periods a week in a well-equipped secondary school, under competent instruction, should be considered worthy to count toward admission to college.

Actual courses of study in our secondary schools show great diversity, as this matter is generally left to the discretion of municipal or district boards of education. Owing to the extensive circulation of all sorts of educational publications, however, and the frequent meeting of teachers one with another in educational conventions, there is a surprising approach toward uniformity in the educational provisions found in all parts of the country. High schools may be found having courses ranging all the way from one to six years in length; but the four-year course is the generally recognized standard. Twenty years ago, it was common to find courses weighed down with a large number of subjects, many of them pursued for only a fraction of a year. This was notably true of subjects in natural science; but it is true to a much less extent at the present day. In spite of all assaults made upon the classical studies, it would perhaps be fair to say that in many of the better schools, public as well as private, the classical course is commonly regarded as the standard, from which the other courses pursued in the same school are looked upon as variants.

The differentiation which appears everywhere in our secondary education appears in the erection of special schools for special classes of students. There is separate schooling of boys and girls, in many instances. The report of the United States commissioner of education for 1896-7 showed a total of 5,109 public high schools in the whole country, of which 35 were for boys only, 26 for girls only, and the remainder co-educational. The same report showed a total of 2,100 private high schools, academies, etc., of which 351 were for boys only, 537 for girls only, and 1,212 coeducational. Another special type of school, the evening high school, has been established in a number of our larger cities. These schools have offered very elastic courses of study, suited to the varied needs of their clientele; and have been a great boon to many who have been obliged to work by day after the completion of an elementary school course. In the Southern States there is further separation between white and colored children, although the latter class of course do not bulk largely in secondary education.

As to manual training schools, St. Louis in 1879 established such a school in connection with Washington University, and within a few years similar schools were established in Baltimore, Chicago, Toledo, New York, Philadelphia,

and other cities. In these schools, the idea of manual training for the purposes of general culture was usually uppermost, their projectors disclaiming any intention of establishing schools for the teaching of trades. More recently trade schools have been established in the largest cities, but for the most part under private initiative and control. The commercial spirit of this country finds expression in the frequent appearance of such subjects as bookkeeping and commercial arithmetic in general courses of study. Special schools for distinctively commercial training are usually private ventures. These are found in great numbers in all parts of the country, generally going by the name of "commercial college" or "business college." The business high school in Washington, D. C., may be mentioned as one illustration of the serious interest which has begun to appear in this side of secondary instruction. See EDUCATION, COMMERCIAL.

One movement should be mentioned which is part cause and part result of the increased attention which is now paid to problems of secondary education, in themselves considered. Reference is made to the study of the several aspects of adolescence, as a stage in the mental development of individuals. Secondary education being essentially the education of adolescents, whatever throws light upon the peculiar psychology and natural history of this period of youth is of value to the educator. Many studies of particular phases of adolescent development have been made within the past few years, under the stimulus of investigations begun at Clark University. These studies are as yet fragmentary; and they cannot be said to have led to well-defined reforms. Yet their influence has been manifest in the general tone and spirit of secondary education. They have prompted to a more sympathetic treatment of our youth in their time of spiritual reconstruction; to a better appreciation of the difficulties attending the passage from the intellectual dependence of childhood to the individual convictions of manhood and womanhood. They have led to a more careful observation of individual differences of development, and have strengthened the demand for greater freedom in both courses and methods of instruction.

Methods of instruction in all secondary school subjects have been profoundly influenced of late from the side of the natural sciences. Laboratories have become common in high schools and academies. College entrance requirements have been extended to include laboratory work in physics, and, in some instances, in chemistry or in the biological sciences. In these laboratories, students perform representative experiments in the science they are pursuing, under the guidance and subject to the criticism of the instructor. These experiments are commonly regarded as illustrative of or preparatory to the statement of principles in a text-book. The "method of re-discovery" has influenced the practice of the schools; yet there are probably few school laboratories in which the students are expected to re-discover on their own account the laws of physics or chemistry, or of any other of the sciences. A fine blending of discovery, verification, and correction seems to be the ideal of our best teachers of natural science. Much stress is laid on the accurate recording of observations and experiments. The students' note-books serve as one of the chief tests of the excellence of their

EDUCATION

work. This is a great advance upon the prevailing method of a generation ago, when the text-book was the main reliance in school instruction, even for classes in the natural sciences. A like change appears in the treatment of other branches than the natural sciences. The attempt is now made to put the student in touch with first-hand materials of knowledge; and to guide and stimulate him to the end of making over these crude facts into real knowledge for himself. This procedure seeks to give full recognition to both the ideal and the sensuous elements in knowledge, and indicates some appreciation of the fact that the ideal element to be truly ideal must be supplied by the active agency of the student's own thought, exercised upon the products of his own experience. In the practice of the schools, we find these principles applied, for example, to the teaching of history. Although text-books are not dispensed with, the effort is made to give the student some acquaintance with the sources of historical knowledge. In the study of literature, less attention is paid to historical summaries than was formerly the case, and more time is devoted to the study of literary masterpieces. In grammar and rhetoric, the study of principles is closely connected with the study of passages from literature which embody those principles in living forms; and with composition exercises upon topics which invite free expression. In modern languages, facility in conversation is not commonly sought, but the ability to read the languages readily and with understanding, and to enter into an appreciation of their literatures, is the end chiefly striven for, and grammar is studied, on the whole, less abstractly than formerly, and more in its actual embodiment in literature. Greater effort is made now than a generation ago to secure a reading knowledge of the ancient classics. There is much difference of opinion among leading teachers as to the proportionate attention to be paid to "sight reading"; and as to the value of the inductive method in the mastery of grammatical principles: but actual practice seems to be tending slowly toward a middle course, which retains much of the old-time thorough discipline in Latin and Greek grammar, but brings this training into more vital connection with the study of classic literature. The question of approaching Attic through modern Greek has been warmly discussed, but the proposed change finds little, if any, acceptance in actual practice. In mathematics, much stress is laid upon the original demonstration of theorems, particularly in plane and solid geometry. Much stress is put upon the use of accurate language in mathematical demonstrations, and, more generally, on the need of more careful and accurate English expression in all school exercises. The attempt to teach English expression, oral and written, wholly through the medium of instruction in other branches does not promise well; but there is a growing recognition of the fact that all teachers must have at least some share in the responsibility for such instruction.

The moral influence of secondary schools is undoubtedly the most important topic to be considered in this paper, but it is at the same time the most difficult to reduce to accurate statement. The religious background of moral instruction has already been referred to. It should be added that even in public high schools, from which all instruction in sectarian dogmas is

strictly excluded, there is not uncommonly found a pervasive religious atmosphere, an influence emanating from the personal character of the instructors. In many of these schools, it is still customary to open the daily session with the reading of a passage from the Bible or the repetition of the Lord's prayer; or with the singing of a devotional or patriotic hymn. In some schools, elementary ethics is taught, but this is unusual, and moral force depends mainly on the personal influence of the teachers, on the government of the school, and on the relations of the students one with another.

Some subjects of instruction offer especial advantages as regards the formation of high ideals of conduct. The teaching of literature, and particularly the literature of the mother tongue, is found to be of great value in this respect—the more so, doubtless, when untimely moralizing is dispensed with, and noble sentiments are permitted to make their appeal through the charm of their artistic presentation. Choice works of plastic and pictorial art are rapidly finding their way into our school rooms, and are expected to accomplish their mission by their mere presence; or to reinforce the æsthetic side of instruction in literature and in drawing. History is probably, on the whole, the most neglected of the main lines of study in secondary schools; and the moral loss resulting from such neglect is serious. Greek and Roman history is commonly taught, at least in classical courses; but too often in a scrappy and inadequate fashion. Later European history receives some attention. The history of the United States is, perhaps, the most seriously slighted of all. The reason for this seems to be that the history of our own country is studied in the grammar schools; and it is only beginning to be emphasized by the colleges as an admission subject.

In the government of our best secondary schools, the relations of teachers and students are comparatively informal, and there is little consciousness of official or artificial barriers between them.

Some interesting and successful experiments have been made in the organization of regular systems of self-government among students. Under any system of government, the social life of the school is the chief teacher of morals. The fact that tuition in these schools is free to all, helps to bring about this result. It is unnecessary to point out the numberless bearings of this democratic spirit in the schools upon the pupils who are subject to its influence. There is undoubtedly a growing disposition among families of wealth and high social position, to send their children to private schools. This disposition is, however, by no means universal.

The social organization of the students in high schools and academies is much alike. The instinct of association is strong and finds expression in clubs, leagues, societies, and fraternities. The several classes are commonly organized, with class officers, and have occasional gatherings of a social character. The offices of the highest class in school are sought for with keen competition. Athletic associations, football and base-ball clubs, and the like, are usually maintained, and several schools often join in an athletic league. Debating clubs and other literary societies are maintained with much interest. Contests in debate with neighboring schools call

EDUCATION

forth a spirit of emulation like that displayed in athletic struggles. Musical organizations are among the most pleasing of school societies. Annual publications by successive classes present a record of the varied interests of the larger schools. Besides Greek-letter societies, formed after the fashion of the colleges, there are sometimes voluntary associations for religious culture and observance maintained by the students. All of these organizations are commonly under the immediate control of the students themselves. The completion of the course of study in a secondary school is celebrated in public with "graduation" exercises and the conferring of diplomas upon the members of the class. The graduates of a flourishing school usually organize in an alumni association.

A committee of the National Educational Association—the so-called Committee of Fifteen on elementary education—reported in 1895, among other topics, on the training of teachers for secondary schools. This committee declared that, "The degree of scholarship required for secondary teachers is by common consent fixed at a collegiate education." They proposed a course of special training for such teachers, consisting of instruction during the senior year of the college course in psychology, methodology, school systems, and the history, philosophy, and art of education; and a graduate year of practice in teaching, under close supervision, supplemented by advanced studies in educational theory. This proposal is far in advance of common practice or requirement. Very few of the American States make any specific requirement for the high school teacher's certificate beyond that for a license to teach in the elementary schools. But in many secondary schools teachers rarely obtain employment unless they are college graduates; and there are large sections of the country in which common usage is rapidly tending in this direction. The most of the leading universities and some of the higher normal schools are devoting especial attention to the professional training of teachers for schools of this grade. A Massachusetts report for the year 1897 shows that one per cent of the high school teachers then employed in that State were graduates of scientific schools, 13 per cent of normal schools, and 66 per cent of colleges. In the State of New York, in 1898, 32 per cent of the teachers in secondary schools (not including principals) were college graduates, 39 per cent were normal school graduates, and 19 per cent were high school graduates. Of the principals, 51 per cent were college graduates, 35 per cent normal school graduates, and 8 per cent high school graduates. These figures include private academies as well as public high schools. They include also one-year, two-year, and three-year schools, as well as fully developed high schools and academies. An inquiry into the preparation of teachers in the secondary schools of California, in October 1897, showed that of the teachers then employed in the public high schools of the State 59 per cent were college graduates.

The several States have been slow to organize general systems of secondary schools. But a few have made considerable progress. The early history of secondary schools in Massachusetts has already been told. This State is the foremost in the Union in the universality of its provision for secondary education. Every

"town" (township) in the State is required by law to provide free high school tuition for all students who are prepared for that grade of instruction. Inasmuch as the whole State is divided into towns, this means that free secondary education is offered to every child in the commonwealth. Of the 353 towns in the State, 185 are required by law to maintain high schools; 70 others maintain high schools, though not required to do so; and those not maintaining such high schools are required to pay the tuition fees of qualified students within their limits who go elsewhere for high school instruction. The poorer towns receive help from the State in paying for tuition in outside schools. The high schools must offer a four-year course, of 40 weeks a year, and they must prepare pupils for the State normal schools, and for higher scientific schools and colleges. The organization of the University of the State of New York has been mentioned. It presents the most thoroughly organized State system of secondary education yet developed on American soil. All incorporated secondary schools in the State and all other secondary schools which may, after official inspection, be admitted to membership by the regents, are institutions of the university. Of the six departments into which the work of the regents is divided the college and the high school departments are under one department director, assisted by nine inspectors of schools and by a large staff of examiners. The regents distributed in 1898 a total of \$209,250.48 in State funds to the secondary schools of the State. The method of distribution is as follows: (a) \$100 is allotted to each school approved by the regents, without regard to its size or special attainments. (b) One cent is allowed for each day's attendance of each student in such schools; provided that each student so counted must hold a "regent's preliminary certificate" for admission to the school, or the school must be approved by two university inspectors, as having a higher entrance requirement than the minimum prescribed for the preliminary certificate. (c) The State duplicates the amount raised by the schools for the purchase of approved books and apparatus up to the sum of \$500 a year for any one school. (d) Grants are made on the basis of credentials obtained by pupils in the school who pass the regents' examinations—a method of "payment by results." In 1898, of the money distributed by the regents to secondary schools, about 25 per cent came under item (a); 22 per cent under item (b); 19 per cent under item (c); and 34 per cent under item (d). The regents' examinations are held three times a year. The diplomas issued by the regents to graduates of secondary schools are accepted by Cornell University and by other institutions of higher education in the State, in lieu of entrance examinations in the subjects which they cover. A syllabus is issued by the regents for the guidance of instruction in university institutions. There is free consultation between the officers of the university and the instructors in the schools with reference to the contents of this syllabus. An annual university convocation, in which the representatives of all divisions of the university meet for public discussion, forms one of the notable educational gatherings of the country.

In Maryland, a law of the year 1865 swept away the old academy system, and substituted for it a system of county high schools. This radical

EDUCATION

change was followed by a reaction. Later legislation took a middle course. A law enacted in 1872 provided for the establishment of high schools in the several counties, to be under the control of the boards of county school commissioners, or of district boards appointed by them. Each of these high schools must be "visited and examined annually by the principal of the State normal school, or a professor thereof," and must also be visited once in each term by the county examiner. The support of these high schools is provided for by the county school commissioners, who set apart for that purpose a portion of the ordinary school funds received from the State and the county. About 20 academies continue to receive direct donations from the treasury of the State.

In Indiana there is virtually a system of university accrediting of high schools, the administration of which has been turned over to the State Board of Education. In July 1873 the board of trustees of Indiana University adopted a resolution to the effect that a certificate "from certain high schools" should entitle the bearer to admission to the freshman class. In August of the same year, the State Board of Education adopted plans under which the high schools which were worthy of such recognition should be designated and commissioned. In 1888 the following order was passed: "That hereafter no high school commission be granted except on a favorable report in writing, to be made to the State Board of Education, by some member of the State Board, who shall visit the high school in question as a committee of the State Board for that purpose. That all the high schools now in commission be visited by committees of the board as soon as may be, and that the present list be modified by the reports from such visitation. That in case of change of superintendent in any commissioned high school, the commission then existing shall be in force until a visitation shall be made by a committee of the State Board." By such simple means and without specific legal enactment, an important system of high schools has been built up. They are supported in the same manner as the elementary schools.

Minnesota may be taken as another type of secondary school control as that State has maintained a State system of high schools since 1881. At the head of this system stands the State high school board, which appoints a high school inspector and a graded school inspector. Any public high school in the State may become a State high school, and is then entitled to receive from the State the sum of \$800 annually. To be a State high school, it must admit students of either sex from any part of the State without charge for tuition, must provide a course of study covering the requirements for admission to the University of Minnesota, and must be subject to the State rules and open to inspection. The State high school board conducts a written examination of classes in the schools twice a year. Students who successfully pass such examinations receive certificates for the subjects so covered; and these certificates are accepted by the university and the normal schools of the State in lieu of entrance examinations in the subjects specified. The taking of this State examination is ordinarily optional with the school; but the State board may require a school to

take an examination as a part of the annual inspection. Perhaps the most significant thing about the Minnesota system is the encouragement it gives to high schools in the smaller towns. Communities all over the State tax themselves freely to supplement the bounty distributed by the State board.

Several other States have made marked advance within the past few years in the direction of improved systems of secondary schools, improvements gained through the untiring efforts of devoted friends of education.

ELMER ELLSWORTH BROWN,

Prof. of Education, University of California.

Education, Supplemental. To define clearly the nature and relations of this type of educational work, the three main divisions of the whole field of education may be indicated as follows:

First.—Fundamental education, or that which prepares one by general or professional training for entrance upon his life work. This is the particular service of the schools proper conducting their work for the professionally student class.

Second.—Incidental education, or the education of experience. This is acquired as one meets the problems and performs the duties of his daily life and work.

Third.—Supplemental education, or that which makes up the deficiencies in one's fundamental education, or furnishes the necessary complement to one's incidental education. It gives that for which one has present need but has failed to get in the schools and is now failing to get in active life. This is the particular work of educational movements other than the schools proper and serves most largely those who are professionally something else than students. Supplemental education is not an imitation of fundamental, nor a substitute for incidental education, but it presumes under the stress of age and working conditions unfavorable to the most efficient intellectual life to give an individual from a life standpoint that educational help which he needs most next.

Features.—Among the most feasible and fruitful agencies of supplemental education are Reading Rooms, with attention given to the suggestion and direction of reading; Museum Exhibits, with descriptive bulletins inducing intelligent observation, conversation and reference reading; Libraries, special, rather than general in nature, so selected and placed as to make them accessible and helpful in connection with one's daily life and work; Reading Courses, furnishing incentive to wisely selected, consecutive and progressive reading and study; Instruction by Correspondence, setting educational tasks for detached and irregular students, and projecting for their aid the encouragement, instruction and counsel of the teacher; Directed Conversations or Practical Talks, bringing together for conference parties of large experience and ability to advise on practical life subjects and those who need such advice; Educational Lectures, making accessible in attractive and instructive form the results of the extended studies, or special observations of advanced scholars and practical experts; Educational Clubs, ranging from the temporary round-table to the permanent association or guild, calculated to encourage and facilitate co-operative reading, investigation and

EDUCATION

discussion; Tutoring, providing unusual opportunities for rapid study, or the meeting of peculiar needs under abnormal conditions; Educational Classes, furnishing direct instruction, adapted to meet as immediately as possible the students' current interests and needs, being conducted most largely in the evenings, and at other times and under conditions not common in the schools proper. The necessity for this variety of features arises from the widely varying needs and educational inclinations of the constituencies which they serve. While many of these features are commonly used as extensions of school work, or auxiliaries thereto, in the field of supplemental education they become prime agents in awakening and guiding the intellectual life of the people, without special regard to making their influence tributary to any institution for fundamental education.

Purposes.—The educational purposes wrought out by supplemental educational work may be indicated as follows:

First.—Awakening one to a sense of his intellectual needs and cultivating his appreciation of intellectual living and culture.

Second.—Enabling one to investigate his special interests, discover his natural bent and measure his capacities.

Third.—Providing facilities for making up delinquencies in one's elementary education.

Fourth.—Giving special fitting for improved service or advancement in the line of one's present employment.

Fifth.—Fitting one unfortunately situated through the educational occupation of his leisure hours for successful entrance into lines of activity for which he is better adapted.

Sixth.—Enabling one whose activities tend to restrict or distort his intellectual life, to regain or to maintain a good mental balance.

Seventh.—Keeping intellectually awake one now detached from liberal educational opportunities to which he has been accustomed and who tends consequently to lapse into mental stupor and inactivity.

Eighth.—Giving effectual encouragement and guidance to one's individual or private reading and study.

Ninth.—Making practically useful the training and culture of one liberally educated through his rendering educational service to those less privileged.

Tenth.—Through the educational occupation of leisure hours adding to one's mental equipment, perhaps already sufficient to meet the demands of a workaday life, those cultural elements that broaden one's interests and sympathies beyond the limits of his own work.

Principles.—Any supplemental educational movement must incorporate as fundamental principles in the conduct of its work, the following:

First.—It must deal with two rather distinct classes: (a) students proper—constituting the small minority who seek with definite student purpose, but under unusual conditions, a general education; (b) non-students—constituting the large majority, who seek by suggestion or adapted instruction, educational help in the solution of some present problem or fitting for some special service.

Second.—The scheme of educational work offered must make the various features elective to a maximum degree.

Third.—The work must be flexible enough in adaptation to meet individual, special and even transient needs and conditions, without unnecessarily violating popularly recognized educational forms.

Fourth.—The features must be presented in small and varied units.

Fifth.—The various units of work must be so scheduled that sequential arrangement in courses is possible when desired, and even encouraged.

Sixth.—All forms of work must glow with the recreative element, both in subject matter and treatment.

Seventh.—In many of its rudimentary forms the work must aim at suggestion and inspiration, rather than complete or thorough training.

Eighth.—The work must seek primarily the increase of one's capacity to live efficiently and largely, rather than the accumulation of knowledge or the development of scholastic ability.

Ninth.—Much stress must be laid on teaching, leading and co-operating in study as important means of education to those rendering such service.

Tenth.—The work must have its own distinct ideals, methods and estimates of value, basing them upon the current conditions and individual needs of the non-student class rather than on regular school standards, applicable primarily to the student class.

Administration.—Adaptation: The methods of administration of supplemental educational features must be adapted to meet the peculiar conditions and personal attitudes of those to be served. The desirable locations for such work are in the natural assembling places of working people, especially during their leisure hours, as largely as possible making the educational effort in which they participate a natural adjunct to their everyday life instead of making it a separate and distinct enterprise. This consideration causes the placing of libraries, reading rooms, talks, lectures, and even club and class work in stores, factories, athletic, social and religious centres instead of congesting all these features in distinct places set apart in the community as strictly educational centres. Advantage is also gained by offering the educational features in connection with other privileges, physical or social, the continued interest of many people being attendant upon identification with an associated group of varied privileges, offering not only self-improvement but recreation. This combination of educational opportunities with other privileges also serves another purpose in the reducing of embarrassment which many feel at having to be instructed after passing the usual school age. Because of the extreme self-consciousness of the mature non-school class when endeavoring to make up their deficiencies or working on unusual lines of effort, there arises the necessity for careful shaping of administrative plans to avoid in advertising, reports and current conduct of the work, making the party conspicuous as a delinquent or as a belated or emergency student.

Independence: As a practical expediency in the promotion of both fundamental educational institutions and supplemental educational movements it is usually wise in matters of administration to keep the two separate and distinct. This provides against the necessarily irregular, special and frequently uncredited work of the supplemental movement discounting or handi-

EDUCATION

capping the conduct of the necessarily systematic, aggressive and credited work of the educational institution; while on the other hand it protects the supplemental work from being restricted in its liberty of adaptation and converted into a mere auxiliary feeder to some school. It has been found equally expedient that such movements intended for the employees of commercial and industrial concerns shall not be dominated by the employers and advanced by compulsory or coercive means to contribute to the economic advantage of the concerns.

Support: The administration of supplemental work, since it must meet the students' individual needs in a manner most economical of their time and means, must be non-mercenary. The genius and true spirit of supplemental education is lost as soon as the interests of the management of the educational enterprise take precedence over the interests of those intended to be served by it. While there is a general willingness on the part of those enjoying supplemental educational advantages to meet the actual current expense incurred by such work, pioneering in the establishment of features in new locations, and the expense of special equipment and general supervision must usually be met by private gifts or income from endowment. Many commercial and industrial concerns, as well as private individuals, are liberal givers for the support of such work, and in some cases municipal and governmental assistance is also given. Increasingly in America and Europe, endowments are being established for the extension, equipment and supervision of supplemental educational movements.

Supervision: In order to maintain the closest possible working contact with the employed classes it is common to have in the leadership of supplemental educational movements a large number of individuals, representative of the various classes of people in the community to be served, and also representative of the various walks of life. The active participation of these representatives in the guidance of the features insures that the movement shall be constantly attuned to current conditions and needs and saved from becoming either distorted in the hands of extreme faddists, or crystallized into an arbitrary educational system entirely dominated by professional schoolmasters. In addition to this safeguard and because most supplemental educational movements must be launched and maintained by sheer force of inducement and personal leadership, the work being practically injected into situations which reveal no conscious or intelligent demand, there is need, as in perhaps no other form of educational work, for liberally trained, energetic and tactful supervision. The supervisor of such movements must be thoroughly sympathetic with the purposes and activities of fundamental educational institutions working especially for the student class, but must also be keenly sensitive to the educational needs and possibilities of the great non-school population. He must give attention, not alone to the determination of educational forms and methods to be pursued, but must engage himself as a strategist in setting up educational campaigns, and in enlisting both paid and volunteer workers in carrying out the desired enterprises. In short he must be a promoter and counsellor in natural life movements, rather than the pro-

fessional superintendent of an educational institution.

Credits: Since supplemental educational movements deal mainly with a different class and with different objects in view from the schools proper, it is found expedient that not only courses of study, and frequently the methods of treatment, be distinctive, but that in features where formal recognition or credits are given for work done, these credits shall also be distinctive, the forms of certificates being sufficiently specific and in detail to avoid any misjudgment of value, or confusion with the credits for systematic student work in fundamental educational institutions. Such specific credits are, however, readily convertible into equivalents in school credits, and are received for entrance requirements and advanced standing in many schools and colleges. The majority of those engaged in supplemental educational work give little thought to formal credits, being satisfied with the personal returns from the privileges enjoyed.

Types.—Some of the notable types of supplemental educational movements are to be found in the Continuation, or Supplementary, Schools of Germany, the Polytechnic Institute in London, and in America, aside from public libraries, night schools and lecture courses under municipal direction, the Chautauqua movement, University Extension, vacation schools, certain of the correspondence schools, special schools of instruction allied with commercial and industrial concerns, and the educational departments of institutional churches, social settlements, and of the Young Men's and Young Women's Christian Associations. Probably the most comprehensive movement of the distinctly supplemental educational type has been developed in connection with the Young Men's Christian Associations in North America, the records for the year 1903-4, after a single decade of systematic promotion, showing, exclusive of religious and Bible study lectures, clubs and classes, the conduct in 1,005 different associations of 661 reading rooms with 32,403 periodicals; 707 libraries with 578,382 volumes; 3,267 educational lectures and talks; 618 educational clubs and 376 groups of educational classes; covering a very wide range of subjects and enrolling 32,821 different men, taught by 1,516 employed teachers.

WALTER MABIE WOOD,
Superintendent of Education, The Young Men's Christian Association of Chicago.

Education in Latin-America. The peculiar nature of the problems in the field of education which the Latin-American republics have been called upon to solve may be shown most conveniently if we consider, (1) the experience of Mexico, and (2) that of Brazil. Characteristic differences in the educational systems of other Latin-American countries are mentioned where the context serves to explain them—that is, in the articles dealing generally with the history and institutions of those countries. In Mexico, subsequent to colonial legislation the first law on the subject of education, in 1823, was based upon liberal principles and contained an excellent plan of study for use in public schools; it provoked a revolution, however, by appropriating some real estate belonging to the Church, suppressing the clerical

EDUCATION IN LATIN-AMERICA

university, and exempting public education from the control of the clergy. The clerical party succeeded in re-establishing the university under direction of the clergy and restoring to the Church its confiscated property. Wars, civil and foreign, and the undetermined relation of the States to the central government, stopped or hindered educational progress, but in 1843 the government established uniform methods of teaching and a graded system of classes in schools. An effort was made in the same year to centralize the management of the educational system in the city of Mexico. Three years afterward the States resumed their proper share of authority in this matter. Between this time and 1857 the country was distressed by revolutions, dictatorships, and the war with the United States which resulted in the loss of more than two fifths of the Mexican territory; but when the constitutional government was established (1857) the educational law of 1843 was restored. In 1861 Ramirez, minister of justice, secured the passage of another law on this subject, liberal in spirit like that of 1833. War with France (1862-7) made it impossible to carry out the provisions of that law; in December 1867, however, the establishments for secondary instruction were reopened, and an effort was made to improve the primary schools and to bring the methods of teaching into harmony with republican principles. The privileges of education were, by the law of 15 May 1869, extended to all social classes, and primary instruction was made obligatory in the federal district and territories. Thus we find that the triumph of liberal theories was preceded by a contest which lasted for 36 years, at least. "The results of this triumph," as Mr. Hilder well says, "have been the complete separation of church and state, universal religious toleration, a constitution based on the broadest republican opinions, a free press, and free schools." Meantime the great mass of the people had remained ignorant and untrained. The task of the government was therefore exceedingly difficult. A plan hopefully formulated in 1873 could not be carried out; in fact, the practical device for producing an impression upon the millions of utterly indifferent common people appears first in a law of 1888 requiring all persons having control of minors to *prove* that the children in their care had received the necessary primary education; the penalty for violation or neglect of this order being a fine (10 cents to \$10) and imprisonment for not more than 10 days. In 1889 Baranda, minister of justice and education, called a convention of prominent educators and representatives of the different States of the republic. The convention met in the city of Mexico 28 November, and its sessions continued until 31 March 1890. A second educational convention met 1 Dec. 1890 and remained in session until March 1891. The conclusions reached in these pedagogic congresses were embodied in the law of 21 March 1891, which provides that instruction in the public schools shall be secular and gratuitous, and that primary elementary instruction (obligatory for children of both sexes from 6 to 12 years of age) may be obtained in any public or private school, or from private tutors. In the federal district and territories committees have been formed to see that the law in respect to compulsory education is complied with; in the States, however, "and particularly the less

populous ones, and where the Indians predominate, compulsory attendance, although recognized by law," it is said, "can not yet be enforced." For the uncivilized Indians of remote districts special schools are provided in which the teachers are young members of the same tribes, trained in normal colleges. The government has organized many schools and colleges in which higher education and scientific training may be obtained. The principal institutions are: National College of Engineers and Mining (all classes open to the public, and no fee required either on entrance or at the time of receiving degree or diploma); Medical College; National Medical Institute (established by the government 1888-90, for the study of the flora, fauna, climatology, and geography of the country, and their practical application to the science of medicine); National College of Agriculture and Veterinary Surgery; Commercial College; National School of Fine Arts; National Conservatory of Music; National Law School; National Military College; normal schools for training male and female teachers; National School of Arts and Trades for Men (manual training and a higher education for workmen); the same for women (founded by President Juarez 1871, for the purpose of improving the social condition of workingwomen and affording them an opportunity to fit themselves for good business positions); National School for the Blind; a school for deaf-mutes; industrial school for orphan boys; La Paz College (for women); Correctional School of Trades and Professions (for the reformation of boys under 18); and the National Library, containing 170,000 volumes, the nucleus of the collection being formed by the books and documents which came into the government's possession through the suppression of ecclesiastical colleges. There are museums in nearly every State, supported by the local (State) governments. The principal cities, Toluca, Morelia, Guadalajara, Guanajuato, Puebla, Merida, and others, have literary and scientific associations, and a score of such societies exist in the federal district. Of these the most influential is El Liceo Hidalgo, which has for its aim the encouragement of native talent. President Diaz stated in his message of 1 April 1895 that there were about 8,000 public schools for primary education in the republic, with 500,000 scholars; that the amount appropriated by the government for educational purposes was about \$3,500,000 per annum; and that in the federal district there were 62 private free schools, and 195 private schools in which pupils paid for their education. The influence of the government's educational policy since 1857 has been very marked, in spite of the difficulties we have mentioned; and the good results are seen especially in the improved intellectual status of women. Mr. Hilder says that "there is now a very large and influential middle class, composed of both Indian and mixed races, which is every year, by the spread of education, gaining accessions from the humbler class"—the latter making good progress under the new order of things.

Brazil was notably unprogressive during the three centuries of her existence as a colony, while her intercourse with the outside world was controlled by Portugal, though an interest in art and letters awoke when the Portuguese court was transferred to South America (see

EDUCATIONAL LAND GRANTS — EDUCATION OF WOMEN

BRAZIL). King John introduced printing-presses, established schools, and promoted arts and sciences; the country was visited by large numbers of foreigners, including distinguished writers and scholars, and all this tended to improve the manners and enlarge the ideas of the people. Moreover, when the Cortes of Portugal recalled the king (1821), he left his historical library, which became the nucleus of the great public library at Rio de Janeiro. Independence was declared 7 Sept. 1822, and by a decree in October 1823 any citizen was authorized to establish a primary school without obtaining a special license—a radical departure from the old custom of entrusting elementary education to the clergy alone. In 1827 a law was passed authorizing the establishment of public primary schools in all the cities and towns, but little progress was made until 1854, when a thorough reorganization of the school system was effected. During the second half of the century a development has taken place which is certainly admirable; and no one will be disposed to withhold his commendation who reflects that the country was obliged at the same time to deal with such problems as the Paraguayan war, the emancipation of the slaves, and the change in the form of government from monarchy to republic. Under the constitution the instruction given in public institutions is secular, gratuitous (in primary schools), and at the charge of the various States and municipalities. In some of the States primary instruction is compulsory. An excellent standard has been established in primary schools (except those of remote districts, which are decidedly inferior). Pupils are admitted to the first-grade schools from 7 to 13 years of age, and to the second-grade schools from 13 to 15 years of age. There are separate schools for girls, who are admitted to the first grade at the age of 8 years. The course of study in the first grade is: reading, writing, the Portuguese language, arithmetic as far as the rule of three, metric system, elements of geography and history (especially of Brazil), introductory lessons in physical science and natural history, moral and civic instruction, drawing, elements of music, gymnastics and military exercises, manual training for boys and needle-work for girls, and practical lessons in surveying. The number of primary schools in the republic was recently stated to be 7,017, and the number of pupils about 300,000. There are several hundred private schools. Secondary education is provided in the *Gymnasio Nacional* (two establishments thus named in the capital; course of study seven years). National institutions for higher education are: two law schools (those of São Paulo and Pernambuco); two schools of medicine and pharmacy (at Rio de Janeiro and Bahia); the polytechnic school at Rio de Janeiro; the school of mines at Ouro Preto in the State of Minas Geraes; military and naval schools; the National Academy of Fine Arts, Institute of Music, and Museum; and finally the National Library, containing an immense collection of books and maps, manuscripts, prints, and coins.

Education of Defectives. See DEFECTIVES, EDUCATION OF; BLIND; DEAF; DUMB; FEEBLE-MINDED, etc.

Education of Women. The changes during the 19th century include none more significant than those in the history of education for women. So swift has been the transition that it is difficult to realize that until after the Revolution practically the only opportunities for a girl's education were found in the so-called "Dame Schools," where she was taught to read and sew, the 'New England Primer' being the chief text-book. Even the art of writing was not universal, as is shown by the number of wills, left by women of property, which were signed with a cross. The grammar schools, providing instruction sufficient to prepare young men for college, only occasionally admitted girls until the beginning of the 19th century. The exceptions were less than 12 in the first century of our colonial history, as shown by the records of nearly 200 towns in New England. The town of Medford, Mass., voted in 1766 that "The Committee have power to agree with the School Master to instruct girls two hours in a day after the boys are dismissed"; Dorchester in 1784 voted "that such girls as can read the psalter be allowed to attend the grammar school from the first day of June to the first day of October," and Gloucester in 1790 passed the following resolution: "And also that the master be directed to begin his school from the first day of April to the last day of September at 8 o'clock in the morning and close at 6 o'clock in the afternoon, or any 8 hours in the 24 as shall be thought the most convenient, but that two hours, or a proportionable part of that time, be devoted to the instruction of females—as they are a tender and interesting branch of the Community, but have been much neglected in the Public Schools of this town."

In Norwich, Conn., they were admitted "from 5-7 A.M.," and Nathan Hale, school-master in New London in 1774, writes, "I have kept during the summer, a morning school between the hours of 5 and 7, of about 20 young ladies: for which I have received 20 shillings a scholar by the quarter." This admission of girls at times during the day and year, when the schools were not needed for the boys, seems to have been common during the last years of the 18th century. Northampton, which had voted in 1788 "not to be at any expense for schooling girls," four years later voted "by a large majority to admit girls between the ages of 8 and 15 to the schools from May 1st to October 31st," and Boston, in 1790, opened the schools to girls during the summer months, when there were not enough boys to fill them.

One of the first advocates of education for girls was a graduate of Yale College in 1780, William Woodbridge, who took for the subject of his graduating essay, "Improvement in Female Education," and afterward opened an evening school for them in which he dared to teach such abstruse subjects as grammar, geography, and the art of composition. The founding of

EDUCATION OF WOMEN

academies, to which girls as well as boys were admitted, is another evidence that in the latter part of the 18th century and the early part of the 19th, there was a new sentiment concerning their education. The first quarter of the 19th century might well be called the "Academy Age," since the most distinctive advance was in the founding of these institutions. The first one was at South Byfield, founded by bequest of a certain William Dummer, who died in 1761. Leicester, incorporated in 1784, Westford (1793), Bradford (1803), Monson (1804), were all coeducational at the beginning, although Bradford later excluded boys and has been for many years a school for girls. The so-called Academy at Medford, Mass., founded in 1789, is said to have been the first in New England for girls only, but was followed by others which became more famous, such as Adams Academy in Derry, N. H. (1823), Ipswich Academy, in Massachusetts (1828), and Abbot Academy in Andover (1829).

There were other efforts for the education of girls before the close of the 18th century in other parts of the country; by the Friends in Rhode Island, by the Friends and Moravians in Pennsylvania, the latter founding a school in Nazareth, before the middle of the century, and as far south as Lexington, Ky. None of these institutions, however, aimed to give higher education to women; the academies prepared boys for college, but 200 years after the founding of Harvard College there was not a college for women in the country.

A movement for the higher education of women began about 1820. The Rev. Joseph Emerson, principal of the Academy at Byfield, had become noted for his championship of the cause and had attracted to the Academy women like Zilpah Grant and Mary Lyon, whom he inspired with zeal for learning as a preparation for service. In 1820 Emma Willard's 'Plan for Improving Women's Education' attracted the attention of Governor Clinton of New York, who secured the passage of two acts, one the incorporation of a proposed seminary at Waterford, and the other, "To give female academies a share of the literary fund," probably the first law passed by any legislature, expressly favoring women's education. The seminary was opened in 1821, not at Waterford, but at Troy, N. Y., as the Troy Female Seminary, later known as the Emma Willard School.

In 1822 Catharine Beecher opened a seminary at Hartford, Conn., in the upper room of a store. Beginning with 7 pupils, it soon grew to more than 150, and attracted students from all the States, but after 10 years was discontinued on account of Miss Beecher's removal to Cincinnati. Her interest in education was thus transferred to the Middle West, where for a generation she helped to mould public opinion on the subject.

From 1830-9 several institutions for the education of women were established, most of them in the South, the Wesleyan Female College at Macon, Ga., being authorized to grant degrees. In 1835 Wheaton Seminary in Norton, Mass., was founded by Judge Wheaton in memory of his daughter. His daughter-in-law, Mrs. Eliza Wheaton, instrumental in the founding of the school, lived until June 1905, its constant benefactor and a significant figure, as representing

the last of the little group who, in the thirties, were laying the foundations of higher education for women.

Adviser and helper in the founding of this school was the woman who holds a foremost place among pioneers of higher education. Mary Lyon's reputation as student and teacher had already been won in the academies at Byfield, Amherst, Ashfield, and Derry, and with Miss Grant in the seminary at Ipswich, but her chief work was in the founding of Mt. Holyoke Seminary. Incorporated in 1836, and opened in 1837, in the town of South Hadley, Mass., the seminary realized the ideal for which the founder had been working for years, that of a permanent institution for women which should furnish "every advantage that the state of education in the country will allow." The first curriculum, including the natural sciences, higher mathematics, logic, moral philosophy, ancient and modern history, evidences of Christianity and Butler's 'Analogy,' shows a decided advance since the days when Mr. Woodbridge was considered eccentric because he believed that women should be allowed to study grammar, geography, and composition. It marks an era in higher education, in the establishment of a permanent, endowed institution, which should furnish to women, at moderate rates, as good educational opportunities as the colleges for men then offered. Its founding is not less significant in its influence as the "mother of schools." Among the institutions established on the same plan, with its graduates as principals and teachers, are the Western College at Oxford, Lake Erie College at Painesville, Ohio, and Mills College in California. Michigan Seminary at Kalamazoo and the Cherokee Seminary, in what is now Indian Territory, were also Mount Holyoke schools, while across the water they were founded in Persia by Fidelity Fisk; in Turkey at Marsovan and Bitlis; in South Africa, where the Huguenot Seminary at Wellington, Cape Colony, is the most famous; and in Spain, in the form of the International Institute of Madrid, founded at San Sebastian, by Alice Gordon Gulick. Miss Lyon's influence is seen also in the establishment of Wellesley College, for its founder was a strong friend of Mount Holyoke and included many of its features in his own institution.

The intervening period before the Civil War saw the rise of numerous schools for the education of women, but only two of full collegiate rank to-day, Rockford College in Rockford, Ill., opened as a seminary in 1839 and chartered as a college in 1892, and Elmira College in Elmira, N. Y., founded in 1855 and authorized from the beginning to confer degrees. It is interesting to notice that most of these institutions were in the Southern States, a development cut short by the war, the Randolph-Macon Women's College at Lynchburg, Va., opened in 1893, being the only separate college of importance established since that time.

The last 35 years of the 19th century were marked by an advance movement in women's education such as the world had never before seen. During this period three types of institution were developed:—

1. The separate women's college.
2. The women's college affiliated with the university.

EDUCATION OF WOMEN

3. Coeducation in the universities for men.

The first and second types are characteristic of the East and the third of the West, although the distribution is not entirely along sectional lines.

The Separate Women's College.—The conviction of Matthew Vassar, that "woman, having received from her Creator the same intellectual constitution as man, has the same right as man to intellectual culture and development," led in 1861 to the incorporation of Vassar College, opened in Poughkeepsie (1865) with more than 300 students, the first of the distinctive colleges for women authorized to confer degrees, with curriculum and endowment sufficient to realize its ideal of collegiate work. In 1875 two other colleges for women followed, Wellesley College at Wellesley, Mass., founded by Mr. and Mrs. Henry F. Durant, in memory of their son, and Smith College at Northampton, founded by Sophia Smith of Hatfield.

Within another 10 years a fourth college was established, Bryn Mawr at Bryn Mawr, Pa., founded by Joseph W. Taylor, and opening its doors to students in 1885. In 1888 Mount Holyoke Seminary was incorporated as Mount Holyoke Seminary and College, and in 1893 became Mount Holyoke College, the seminary course being withdrawn. The development of these colleges for women has been phenomenal. Each one has a beautiful campus, with fine academic buildings and residence halls, is well equipped, and offers a wide choice of elective courses, in addition to the required work, which varies somewhat in the different institutions. The faculty of each includes both men and women, with the latter in the majority. Two, Smith and Vassar, have had only men for presidents, one administration covering the entire history of the former college; two, Wellesley and Mount Holyoke, have had only women; and one, Bryn Mawr, had a man for the first president and a woman, the present executive, for the second holder of the office. The large number of applicants for admission has made it possible for these colleges to maintain a high standard of entrance requirements. Only one, Bryn Mawr, refuses to accept certificates from accredited schools, but all accept the results of the College Entrance Examination Board, and all, except Smith, are members of that board. The total number of undergraduate students in 1904-5 was 4,117, and in graduate work 106, of whom 73 were at Bryn Mawr.

Other colleges in the East, somewhat smaller, but of high collegiate rank, are the Woman's College of Baltimore, founded in 1888 as a Methodist institution, and Wells College in Aurora, N. Y., beginning as a seminary in 1868, but chartered as a college in 1870. The Western College at Oxford, Ohio, Lake Erie College at Painesville, Ohio, and Mills College in California, all beginning as seminaries but later chartered as colleges, are doing good collegiate work, although their numbers are small, as might be expected in sections of the country where coeducation is almost universally accepted.

The Women's College Affiliated with the University.—The college for women affiliated with the university, although the latest development, holds a place midway between the college on a separate foundation and coeducation.

There are five well known institutions of this class, three in the Eastern and one each in the North Central and South Central divisions.

The first to be established (1886) was the H. Sophie Newcomb Memorial College for Women, affiliated with Tulane University in New Orleans. Under the same Board of Trustees as the university, its buildings are in a different part of the city, its productive funds are in part separate, and it has a distinct faculty, including the president. The graduate department of the university has been entirely open to women since 1890.

The Women's College of Western Reserve University, Cleveland, is the outgrowth of an informal system of coeducation, established at Adelbert College, the undergraduate department of the university, in 1872. Sixteen years later women were excluded from Adelbert College, and provision made for them by the establishment of the Women's College. The fine buildings of the college, although separate, are near the other university buildings, and some of the laboratories of the men's college are open to women. The faculty, with the exception of the president, is distinct, but the university confers the degrees and opens all its graduate work to women.

Barnard College, affiliated with Columbia University, was opened in 1889, although 10 years before that President Barnard had urged the adoption of coeducation at Columbia College. As a result of his efforts and of a large popular petition in 1883, asking for the admission of women to Columbia College on the same terms as men, a system was inaugurated known as the "Collegiate Course for Women," which proposed to grant degrees to those who passed the college examination, but made no provision for instruction. The unsatisfactory character of this arrangement led to the establishment of the college, which, with a separate charter and an administrative autonomy, received Columbia degrees, took the university examinations and had university instructors, or those approved by the president. In 1900 another change was made by which Barnard bears the same relation to Columbia University as Columbia College, having its own faculty, endowments, and examinations, but receiving the university degree and being represented on the university council.

In 1891 the corporation of Brown University voted to admit women to the university examinations, but made no provision for instruction and took no action concerning the conferring of degrees. Unofficial instruction, however, was given by some of the faculty of the university during the first year and at least one woman was admitted to the regular classroom, a beginning which resulted in a vote of the corporation in June 1892 opening the degrees and all graduate courses to women. At the beginning of the second year a dean was appointed and a building for recitation purposes secured, where regular undergraduate classes were conducted by members of the university staff under the name of "The Women's College in connection with Brown University." The numbers had largely increased and four classes were graduated before the corporation formally recognized the college by constituting it in 1897 a department of the university. The affiliation is a close one, since the faculty is com-

EDUCATION OF WOMEN

posed of members of the university faculty, and the requirements, courses, examinations, and degrees are the same, thus carrying out the plan of the founder, President Andrews, who designed it not as an "Annex," but as "part and parcel" of the university.

Radcliffe College, in affiliation with Harvard University, although of the five colleges of this class, the last chartered to confer degrees (1894) was one of the first to make some provision other than coeducation for the admission of women to university privileges. Following the precedent of the English universities at Cambridge and Oxford, in 1879 the "Society for the Collegiate Instruction of Women" was organized in Cambridge, Mass., "for the purpose of providing systematic instruction for women by professors and other instructors in Harvard University." The students who completed the course received not a degree, but a certificate stating that the holder "has pursued a course of study equivalent in amount and quality to that for which the degree of Bachelor of Arts is conferred in Harvard College, and has passed in a satisfactory manner examinations on that course corresponding to the college examinations." There was no official relation with the university until 1894, when the society commonly known as "Harvard Annex," was incorporated as Radcliffe College and authorized to confer Bachelor's and Master's degrees, subject to the approval of the president and fellows of Harvard College. The president and fellows constitute the Board of Visitors having the general administration of the college, but the immediate government is in the hands of a council and an academic board, chosen mainly by the associates, who form the corporation. Thus its management is, in general, distinct from that of Harvard, although its instructors are entirely from the university staff.

The affiliated colleges show certain differences in the character of their connection with the university. The chief administrative is generally the dean, only Radcliffe and the H. Sophie Newcomb Memorial College having a president distinct from the president of the university. All these universities open their graduate courses to women, and all, with the exception of Harvard, grant degrees on the completion of that work. In their development much has been accomplished by advisory boards or councils of women, who have collected funds for endowments, erected buildings, acted as advisers, and in many ways promoted their interests.

Coeducation in the Universities for Men.—To Oberlin College, Oberlin, Ohio, belongs the honor of being the first institution of collegiate rank to admit women. Opened in 1833 as Oberlin Collegiate Institute, it was coeducational from the start, although at first women entered the so-called "Ladies' Course," and were not candidates for degrees until 1837. The new departure aroused less comment, since "from the outset the new institution stood for so many unpopular ideas, social and theological, that the mere fact of the admission of both sexes attracted little attention." Its example was not followed for two decades, the second institution in this pioneer work being also in Ohio, Antioch College at Yellow Springs, founded by Horace Mann in 1853, and coeducational

from the beginning. The movement, however, did not gain before the period of the Civil War, various reasons have been suggested for its rapid development since that time, such as the growth of the public school system, generally coeducational, and thus influencing public opinion in favor of the same policy in higher education, and the rise of the factory, relieving the home of many duties and leaving women more free for other interests. Throughout the country the demand for "practical education" was felt and the passage of the Land Grant Act in 1862, appropriating 10,000,000 acres for the endowment of colleges "to teach such branches of learning as are related to agriculture and the mechanic arts" is most significant in its influence upon women's education, since it was interpreted as providing for them as well as for men.

The West and the State Universities have been the leaders in coeducation, only three of the latter, Virginia, Georgia, and Louisiana, being still closed to women, but the East is not without representation in this class. When Cornell University was opened at Ithaca, N. Y., in 1868, the interest of Mr. Cornell and President White in favor of giving equal advantages to young women resulted in the offer from Henry W. Sage of a generous endowment on condition that "instruction shall be offered to the young women by the Cornell University as broad and thorough as that now offered to young men." In 1872 this offer was accepted and Cornell became coeducational.

The movement, however, had spread further east than the state of New York. In 1868 Boston University was opened, welcoming young women on precisely the same conditions as young men, the first institution in Massachusetts to take this step, and according to the report of the president, "the first in the world to open the entire circle of post-graduate professional schools to men and women alike."

Several of the colleges in the East are coeducational, such as Swarthmore College in Pennsylvania, Wesleyan University in Middletown, Conn., Tufts College in Massachusetts, and Colby College in Waterville, Me., although in the last named there is an approach to the plan of the affiliated college. It is interesting to notice that the four colleges named are all sectarian, belonging respectively to the Society of Friends, the Methodists, Universalists, and Baptists.

The opening of the University of Chicago in 1892 added another endowed institution of rank to coeducation, but in 1902, by the so-called "segregation" policy, which means separate instruction for women during the first two years of their undergraduate course, the university provision for them comes partially under the head of the affiliated college. This action, together with the limitation of the number of women admitted to undergraduate work at Leeland Stanford Jr. University in California and at Northwestern University, Evanston, Ill., might be interpreted as a certain reaction in the West against coeducation were these policies not explained by the institutions themselves as efforts simply to preserve a proportionate relation in the undergraduate body. In the light of statistics the fear that the women students may outnumber the men is not unfounded. The re-

EDUCATION OF WOMEN

port of the Commissioner of Education for 1903 states that of 455 universities and colleges men only are admitted to the undergraduate department of 132, while 323 are open both to men and women, and of 43 schools of technology women are in the undergraduate departments of 26.

The comparatively large number of women in technical schools, over 1,000, as indicated in the last report of the Commissioner of Education, suggests the question whether the choice of subjects is determined by sex or by the individual. The curricula of the colleges for women show large departments in the natural sciences, mathematics, political economy, and sociology, as well as in the classics, literature, history, and philosophy. An interesting comparison made between the electives of the men and women in the senior classes of the universities of California and Wisconsin, in 1902, is shown in the following table:

University of California.—Proportion of women in: Letters, 54 per cent; social science, 68 per cent; natural sciences, 66 per cent; chemistry, 20 per cent; commercial course, 0 per cent; engineering, 0 per cent.

University of Wisconsin.—English, 34 per cent; modern classics, 75 per cent; civics and history, 27 per cent; general science, 18 per cent; philosophy, 39 per cent; ancient classics, 49 per cent.

The choice of electives by undergraduates is not conclusive, since the strength of varying departments in different colleges, and certain fluctuations in their popularity, a "drift" impossible to predict or account for, as well as the question of preparation for future work, must all be taken into consideration. The degrees conferred in 1902 afford some comparison as to the courses taken, but not an exact one, as in many institutions only the B.A. is granted for a scientific as well as for a classical course.

	Women	Men
Bachelor of Arts.....	3,061	5,614
Bachelor of Science.....	520	2,801
Bachelor of Philosophy.....	351	729
Bachelor of Letters.....	713	205
Bachelor of Agriculture.....	0	27
Bachelor of Music.....	174	6
Bachelor of Pedagogy.....	48	27
Master of Arts.....	287	1,111
Master of Science.....	6	179
Master of Letters.....	14	14
Master of Philosophy.....	5	12
Civil Engineering.....	0	260
Mechanical Engineering.....	0	305
Electrical Engineering.....	0	76

In general, the position seems well taken that the practical consideration affects women as well as men and that indisposition to elect courses leading to a degree in engineering, for example, is due in part to the fact that the profession of engineering is not generally available for them. Even here the question is not entirely one of sex, for there are women more interested in mathematics than in literature, as there are men of whom the reverse is true. There is evidence for the same conclusion in the electives in education in the universities referred to, 67 per cent being women.

The tendency toward the utilitarian is more marked in the coeducational institutions than in the separate women's colleges, a difference easily explained, since the step is a natural one, from the opening of a work-shop for the men students to the establishment of courses

in domestic science for the women. The universities endowed by the land grant were the first to introduce the last named subject and now form the majority of the institutions which include it in their curricula.

Early specialization is also more common in the coeducational college, the separate college placing greater emphasis in its undergraduate course upon liberal culture. The general tendency to-day, however, is away from unrestricted elective toward more required work, a "group system," or a system of "majors," by which the student may have in her undergraduate course something more than a purely technical and hence one-sided training.

The results of education for women are shown in the large increase of numbers in the professions, the census of 1890 giving the number of women in professional service as 311,680, and that of 1900 as 430,576, an increase of 38 per cent. One of the chief reasons urged by the early champions of the movement was that they might be better qualified to become teachers and to-day their representation in that profession outranks all others. In 1902 there were 327,614 women teachers and college professors, 7,387 physicians, 3,373 ministers, and 1,010 lawyers. The ratio to the entire body of teachers was as follows:

	Per cent
Public secondary schools.....	51
Private secondary schools.....	58
Colleges and seminaries for women.....	72
Coeducational colleges—	
Preparatory departments.....	29
College departments.....	19

In the last few years there has been a large increase in the number and variety of employments which they enter. College women are not only teachers and physicians, but also nurses, superintendents of hospitals, secretaries, registrars and keepers of records, librarians, social workers, in settlements and associated charities, professional housekeepers, assayers, and poultry-raisers. They have opened laboratory kitchens, laundries, and greenhouses, have engaged in scientific and historical research, published books, become musicians and artists, deans and presidents of colleges. Nor has their interest been confined to the professions by which they might earn a living. A recent writer says that "between the two broad oceans there is hardly any significant movement outside of trade and politics which is not aided by unpaid women who work purely out of ideal motives." Educated women are interesting themselves in the problems of the cities in which they live, serving on boards of education and of sanitation, making possible public playgrounds and vacation schools, agitating the questions of improved tenements, pure water supply, and clean streets. The experiment of college training for women has already justified itself by what they have accomplished in promoting public health and morals.

The fear that academic training would unfit women physically and divert them from the home by the attraction of other careers has proved unfounded. The women's colleges and many of the coeducational institutions provide gymnasiums and regular physical training, require out-of-door exercise, and have careful physical examination. These provisions, to-

EDUCATION

gether with the regular hours and systematic life of the college, mean a better physical condition than in the case of the average non-college woman.

To those who know the college woman in her home the question concerning her fitness for it is not debatable. The supreme result of the college training is the development of character, and the cultivation of self-control, of consideration for others, and of a more rational outlook, means preparation for the home as well as for the profession.

M. E. WOOLLEY.

President Mount Holyoke College.

Education, The State Universities. See STATE UNIVERSITIES.

Education, United States Bureau of. The Bureau of Education was originally established as an independent department by act of Congress, approved by President Johnson on 2 March 1867. The bill had been introduced into the House of Representatives the previous year by Gen. Garfield, accompanied with a memorial signed in behalf of the National Association of State and City School Superintendents (later merged into a department of the National Educational Association) by E. E. White (State Commissioner of Common Schools of Ohio), Newton Bateman (State Superintendent of Public Instruction, Illinois), and J. S. Adams (Secretary of State Board of Education, Vermont), which memorial strongly urged the creation of such a governmental agency.

The need of this measure was emphasized at the moment by many conditions. All through the South schools and colleges had been closed or hopelessly crippled by the Civil War. The proportion of illiterates in our population, as shown by the census of 1860, was alarming, and was being rapidly increased by immigration, while "the gloomy total" was swelled, as Gen. Garfield noted in his speech supporting his bill, "by the 4,000,000 slaves admitted to citizenship by the events of the war." The general government had been lavish in its gifts of lands for education, without holding any one responsible for the carrying out of its intent. "No member of this House or the Senate, no executive officer of the government," said Gen. Garfield, "now

knows, and no man ever did know, what disposition has been made of this immense bounty." At that time 17 States could show fairly complete school statistics; the Congressional Library was searched in vain for school reports from any one of the remaining 19. The nation had indeed no means of estimating its educational forces or of comparing itself in this respect with other nations.

The general purpose of the new department was defined by the law as follows: "to collect such statistics and facts as shall show the condition and progress of education in the several States and Territories and to diffuse such information respecting the organization and management of schools and school systems, and methods of teaching, as shall aid the people of the United States in the establishment and maintenance of efficient school systems and otherwise promote the cause of education throughout the country."

The law provided that the President, acting in advice with the Senate, should appoint a commissioner of education, and left large discretion to this officer with respect to the management of the department, including the appointment of three clerks allowed him by the law. The commissioner was, however, expressly directed "to present annually to Congress a report embodying the results of his investigations and labors, together with the statement of such facts and recommendations as will in his judgment subserve the purpose for which the department was established." Thus the annual report has become the exponent of the operations of the office.

The first commissioner, Dr. Henry Barnard, served only three years, from 16 March 1867 to 16 March 1870, and, on account of the uncertain fortunes of the office at this initiatory stage, he had little chance to shape a definite policy. He published during the time a report on education in the District of Columbia, ordered by joint resolution of the House and Senate.

By an act of Congress which took effect 1 July 1869, the Department of Education was changed to an office or bureau in the Interior Department, but without change in the scope of its duties, and shortly after this event Dr. Barnard resigned.

The second commissioner, Gen. John Eaton, appointed by President Grant 16 March 1870, understood well the problems in which the help of the Bureau was needed at the moment—problems growing out of the awakened sense among us of the importance of free public schools, and the conviction agitating the minds of thoughtful men that the national government should assume some responsibility for the education of the freedmen in the South. With these interests clearly in mind, Gen. Eaton addressed himself to the question of pressing importance, namely, that of the actual provision for education in the United States. His first report, covering the year 1870, presented a survey of the whole country, surprisingly complete in respect to the main particulars of State systems of education. By 1873 the inquiry forms for collecting statistical data, drawn up in advice with the leading representatives of institutions and systems of education, were completed, substantially as they have been maintained to the present time. This device of a

EDUCATION

method for bringing the Bureau into vital relation with all local agencies of education and securing their co-operation in its work, was the most important outcome of Gen. Eaton's service. The schedules thus formulated furnish the basis of the annual report required by Congress, and have had great effect in unifying the local reports of education throughout the country.

In 1886, after a service of 16 years, Gen. Eaton resigned. Under his successor, Hon. N. H. R. Dawson, of Alabama, the relations of the Bureau with the higher institutions of the country were strengthened through the arrangement for publication by the Bureau of a series of monographs on the history of higher education in the several States. The work was placed under the editorial charge of the late Dr. Herbert B. Adams, of Johns Hopkins University, who selected a specialist in each State to prepare the subject-matter. Thirty-six monographs of the series have been published to date, all of which have been well received.

With the resignation of Mr. Dawson the formative period of the Bureau ended. The whole educational provision of the United States had been brought within the scope of its inquiries, cordial relations had been established with the directors of institutions and with all State and city superintendents of education, and everywhere educators were beginning to look to the Bureau for helpful suggestion in respect to their professional problems. At this important juncture President Harrison appointed the present commissioner, Dr. W. T. Harris, who assumed direction of the office 12 Sept. 1889.

Under this commissioner the stress of effort in the preparation of the annual report is to interpret the data collected and to present them in such a way as to enlighten every one who has to deal with the problems of education as they arise, either in the schoolroom or in the broader administrative fields. In this way alone can the highest function of the Bureau, as a force stimulating local self-direction, be realized.

The purpose is promoted by Dr. Harris's discussions of educational movements in his introductory statements to the annual reports, and is strikingly illustrated by the statistical method introduced under his direction. By means of comparative statistics the record of past years is organically related to that of the current year, so that a single table comprised in a page suffices to show the development of the public school systems of the country from 1860-70 to the present time: in a few pages the comparison is extended to the geographical sections and individual States of the Union. The record thus presented is impressive by reason of the magnitude of the work disclosed—a work affecting at present above 16,000,000 pupils, at an annual expenditure of \$251,458,000—and by its emphasis upon significant particulars. It offers to each community and institution the means of measuring its progress by that of all others and of discovering the points at which new effort is needed. The survey reveals, also, movements of national significance; it proves the increasing faith of our people in the value of free schools, manifested by increased appropriations for their support and by the almost phenomenal growth of public high schools (in-

creased in 13 years from 2,526 schools, with an enrolment of 203,000 pupils, to 6,800 schools with an enrolment of 592,213). The growing appreciation of the highest means of training and culture is also manifested by the larger proportion of youth in attendance upon colleges and higher technical schools. Whereas in 1872 the proportion of such students was 500 to each 1,000,000 inhabitants, in 1904 it had risen to 1,477.

The exposition of foreign systems of education, which has become a feature of the annual reports, reveals the means by which each nation seeks to develop through its schools its own type of national character, and at the same time shows the movement in all democratic nations for freeing secular education from ecclesiastical control and sustaining it upon the common basis of civic necessity.

In addition to this broad survey of education the annual reports of the Bureau comprise the results of special investigations and discussions of topics of timely interest. A typical example of the former is a paper in Gen. Eaton's report for 1870, embodying the results of a special inquiry into the relations of education and labor. It followed the lines of the far-famed presentation of the same subject in Horace Mann's fifth report, but is even more convincing as to the effect of common school education in increasing the earning power of the laborer.

The thorough manner in which subjects of current interest are treated in the reports may be best indicated by a few special references:

The character and scope of State school systems, as illustrated by the methods of administration and support, and the obligatory studies of the public schools, are shown from time to time by digests of school laws prepared by experts. The latest appears in the report for 1904 (270 pp.).

A chapter on the laws relating to city school boards in 23 typical cities of the United States answers a general demand for helpful suggestions as to the means of meeting the conditions of rapid urban growth. (Report for 1895-6, 71 pp.)

The present status of the certification of teachers in the United States is set forth in the report for 1903 (56 pp.). The data have been carefully collected, critically revised by State superintendents, and reduced to tabular form convenient for reference. Combined with the results of an extensive inquiry into the actual tenure of teachers now in service, prepared for the commissioner's forthcoming report, the certificate requirements indicate very clearly the conditions that are making for the professional character of the teaching service of the common schools and the difficulties in the way of maintaining that character.

The reports of the Bureau have been of great service to the cause of higher education by disclosing fully the scope of the curricula and the standards maintained in the colleges and universities of the United States, and thereby correcting false impressions, both at home and abroad, arising from the varied uses in different countries of the same terms of classification. The presentations under this head include: tabular view of the complete course of study for 100 colleges (137 pages, report for 1888-9); requirements for admission to 475 colleges and

EDUCATION

higher technical schools (156 pages, report for 1896-7); length and organization of typical college curricula (21 pages, report for 1902).

The liberal policy of the nation in the endowment of the agricultural and mechanical land-grant colleges, and the manner in which the several States have supplemented and guarded the bounty, is set forth in a digest of the general and State laws relating to these institutions. The matter, which was comprised originally in two chapters—published respectively in the commissioner's reports for 1902 and 1903—has been brought together in a single monograph to meet special demands for this information.

As indicating the wide range of interest stimulated by the report may be mentioned the "Regulations relating to pensions and insurance in all German universities" (report for 1904), and an installment in the same report of the interesting "notices of some early English writers on education" from the pen of the well-known specialist, Prof. Foster Watson, of University College, Wales. These notes, covering the period 1578-1603, throw light on the state of education in England in the century preceding the English colonial settlement in America.

Statistics relating to libraries are published at intervals of about five years in the commissioner's report. The latest compilation (report for 1903, 258 pp.) gives the statistics of 6,869 libraries having each 1,000 volumes or over, an increase above the number reported in 1900 of 1,486. The number of volumes in libraries of this class is 54,419,002, an increase since 1900 of 9,827,151, or 22 per cent. The presentation includes public, society, and school libraries, showing in detail the duration, size, sources of income, etc., of each. The statistics of 2,242 libraries of less than 1,000 but more than 300 volumes completes the tabular view.

The periodical recurrence to this subject is in line with investigations suggested by Dr. Barnard and culminating during Gen. Eaton's administration with the celebrated report on libraries, issued in the centennial year.

To the functions of the Bureau designated in the original law certain others have been added under subsequent acts of Congress. The entire management of the government schools in Alaska, outside of incorporated towns, which was committed to the secretary of the interior in 1884, was lodged at that time in the Bureau of Education. The following year, Dr. Sheldon Jackson, who had had seven years' experience in the field as agent of the Presbyterian Board of Home Missions, was appointed general agent to take charge of the government schools under the direction of the commissioner of education, a position which he still retains. The two special features of the work thus inaugurated are the association of the schools with the mission stations and the use of the reindeer in the scheme of industrial education. The government bears all the expenses of the secular schools and appoints their teachers, but by the location of the schools at what Dr. Harris has termed "the strategical points for influence upon the natives," their work is reinforced by all the wholesome influences of the mission centres.

The plan of industrial education matured since the introduction of the reindeer in 1891 aims at two objects: the training of the natives as herders and teamsters and their education in

thrift, so that they will preserve and augment the increase of the deer loaned them. In the carrying out of this plan, also, the mission stations have been indispensable aids; "the missionary," says Dr. Harris, "discovers the individuals that are tractable—those that show capacity for learning our industries and spreading our language. These furnish hopeful apprentices for reindeer herders and teamsters." Through this training the natives are enabled to take the long step from the nomadic habits of the fisherman and hunters to that of dwellers in villages with permanent employments profitable to themselves and of inestimable value to the white population that is steadily pouring into the Territory. (See Report of Commissioner Harris, 1896-7, Vol. I., pp. 39-42.)

For the maintenance of the government schools for the fiscal year ending 30 June 1906, Congress appropriated \$50,000, and for the reindeer fund \$15,000.

The commissioner of education is also charged by the secretary of the interior with a limited administration of the fund appropriated by Congress by act of 30 Aug. 1890, for the further endowment and maintenance of the agricultural and mechanical colleges established under the Morrill Act of 1862.

The reports of the treasurers of the several institutions showing that the disbursement of the funds previously received has been in accordance with the specific requirements of the law, are received and audited in the Bureau, and, upon the approval of the respective accounts by the commissioner of education, each State and Territory is duly certified by the secretary of the interior to the secretary of the treasury as entitled to its installment of the fund for the next succeeding year. The amount thus allotted for the year 1905 was \$1,200,000, or \$25,000 to each of the 48 States and Territories.

Apart from the organized functions of the Bureau of Education, it is called upon for important service growing out of the common interests of the leading nations in the processes and results of education. Since the Franco-Prussian war, which greatly stimulated democratic tendencies in Europe, the attention of foreign governments has been more and more directed to the educational policies of the United States. Their interest is manifested by the presence among us of foreign experts and commissions charged with a mission to study our institutions, and by constant requests for information on special points transmitted to our government through diplomatic channels, and eventually referred to the Bureau for consideration. The inquiries are generally of such a nature as to demand the attention of the chief specialists of the office and the careful selection of printed documents or the preparation of extended written statements covering the desired information. The service which the Bureau thus performs as a medium of international exchange realizes an anticipation of its founders; their prevision in this respect is emphasized by the recent organization of special divisions for similar service in the education departments of England and of France.

The Bureau, whose operations have been thus briefly summarized, has published since 1869 33 annual reports and 10 special reports,

EDUCATIONAL ATHLETICS

besides many monographs, and has prepared exhibits for 12 expositions, of which 8 were international.

The present force under the direction of the commissioner comprises, beside a chief clerk, 6 specialists, 29 clerks, 3 assistants to the general agent of education in Alaska, and 7 laborers. The clerical force is organized in four divisions, as follows: statistics, correspondence and records, research and editorial, library and museum.

The library of the Bureau contains 84,023 volumes and 104,500 pamphlets, forming a professional collection of great value. It is a working library whose necessary growth threatens to seriously overcrowd the rented building which the office occupies.

In the preparation of the annual report, 20,000 schedules, comprising 73 items, are tabulated, and a vast number of educational reports, catalogues, and manuals of law are examined and digests of the same prepared for use as circumstances require.

The mail matter received during the year ending 30 June 1904 included 14,210 letters, 91,147 documents from the government printing office, and 167,752 pieces of printed matter. During the same year the mail matter sent out by the office included 12,410 letters and 97,064 documents.

For the present fiscal year the appropriation for the current work of the office, in which printing is not included, amounted to \$58,390.

ANNA TOLMAN SMITH,

United States Bureau of Education.

Educational Athletics. At the outset it must be borne well in mind that athletics in an educational institution is not an end but a means to an end. The end in view is to furnish a healthy habitation for a healthy mind, for without a sound body to carry out its work, the mind certainly cannot do what nature intended it to do. Certain minds incorporated in crippled bodies, it is true, have risen to remarkable heights in the various fields of human activity, but not on account of deformities, but in spite of them. Perhaps there is nothing so detrimental to a good healthy body—not even the use of stimulants—as excessive sedentary pursuits. When a young man is bent on winning scholastic honors, he unconsciously falls into this excess. Of course the natural result follows. Good rich blood is denied the parts; they become starved, and in a short time degeneration sets in throughout the entire body. Then it is that we have a terrible spectacle of a strong intellect unable to do even ordinary work on account of a pain-racked body.

It is to counteract this tendency to starve the body in order to feed the mind, that school authorities have encouraged physical as well as mental training among students. Thus we see that to-day the gymnasium is as important a part in a group of school buildings as a hall of science or of arts.

Although educational athletics is found at its best in the university, and there is little difference between the systems employed in our leading institutions of learning, the question is far from settled as to the best way of exercising the boy in the elementary and high school. It is a generally accepted fact that the kind of exercise—we can hardly dignify it by

the name "athletics"—in the elementary school, is the one which, apparently, has the least system about it. For instance, let a boy exercise for the pleasure he gets out of it, and he will be immeasurably better off than if he exercises because it is prescribed in a school's work. The question of exercise in the country schools is easily solved. Where there is plenty of space and fresh air, no supervision is needed. The growing boy will find enough games to give him sufficient exercise to keep him healthy. However, in large cities, where there are few or no play grounds; where because of the congestion on all sides, tainted air is the best to be had, a real problem presents itself. A boy must have action; he must move about. A lad of 10 or 12 years is too young to differentiate clearly between good and bad, and if he does, he cares very little, as long as he finds a means of action. As a result, if he finds an outlet for his youthful spirits in a corner gang, he joins it, and we have the beginning of, if not an undesirable citizen—at least an undermined human body. On the other hand, give him pure air, and a play ground in which to romp, and we have a healthy boy. In short, play grounds will solve the problems of exercise in the elementary schools of large cities. Of course, it is impossible to furnish play grounds in many cases, so calisthenics have been introduced. Naturally, this is not as good as a game into which a boy goes with a zest, yet it does a great and an important work.

Athletics reduced to a system is for the first time found in the high school. The games played are much the same as in the college, namely, baseball, football, track sports, tennis, and basketball, while in some of the high schools of the Middle West we find in-door baseball. As a rule all interscholastic competition is under the control of the school principal, or a member of the teaching force appointed by the principal. There is much to be said pro and con as to the good that boys get out of their sports. Many educators and physical trainers agree that the high school lad exercises too strenuously. They say that the boy's body is not matured, and he therefore lays himself open to grave injury. Furthermore it is maintained that the undeveloped mind of the school boy is inclined to give athletics too important a place in his school work. Then again in many of the larger high schools professional coaches are often employed. In many instances a coach is more bent on a team's victory than on the health of his charges. However, in spite of all the objection that can be raised on this score there is little doubt that high school athletics has done much good.

All over the country there are interscholastic associations made up of high schools in adjacent counties. The winners in the respective meets compete in larger meets under the auspices of the athletic associations of some nearby university. In many of the western States, State high school track meets are held annually by the various State universities. Beside the rivalry between high schools located in the same section, there have been contests between the champion football teams of the Middle West and those of the East, and strange to say, in all of these intersectional meetings, the western schools have come out with flying colors.

Possibly the great fault to be found with ath-

EDUCATIONAL ATHLETICS

letics in high schools, and this is true of the universities as well, is that not enough boys get an opportunity to take part in the games. In other words, the majority of the pupils, and perhaps those who need it the most, get no exercise at all outside of calisthenics. If some system could be thought out whereby the whole school could take part in games, a finer lot of men, physically, would enter and graduate from our colleges. The solution of this difficulty probably lies in introducing a sufficient number of new games, so that every one can find some game that suits his temperament and needs. But it is with athletics in the university that we treat more especially, for athletics should come to their fruition there. The main object of the department of physical training in the university, is to preserve and improve the bodily health of the students by careful physical examinations, and rational prescriptions of exercises; by correcting physical deformities, and imperfect development; by teaching proper methods of living; and by encouraging proper intercollegiate sports.

Generally speaking, every university in the United States has the same routine. Each student is required to undergo a physical examination, so that a correct knowledge of his bodily condition is obtained and proper exercises prescribed. Regular classes are formed for drill in ordinary arm, body, leg, and wand calisthenics, and then on the various gymnasium appliances and apparatuses. During the freshman year at least, gymnasium work is compulsory. Exceptions, however, are made in the cases of those who make athletic teams. Besides the exercises themselves, lectures are given on personal hygiene. If the college is a co-educational institution, the female students take physical training under a competent woman instructor. In several institutions young women have taken part in basketball, and in rarer cases in track athletics, and on several occasions have made enviable records.

All competitive athletic games are given under direct faculty supervision, and examination is required to show that the membership on any team will not cause injury to the student, but will tend to improve his physical condition. No student, whose class work is unsatisfactory, is allowed to play on a university team. No student is permitted to play on an athletic team more than four years. All those who take part in collegiate sports must be amateurs.

Of all intercollegiate sports the most popular and the one most distinctively a college sport, is football. The football season begins in the middle of September and ends with Thanksgiving day. Intercollegiate contests begin about the first of October, since the last half of September is taken up with the training and conditioning of the players. The schedules are usually arranged so that the first games are easy to win, but they gradually become harder, until Thanksgiving, when rival teams trained to the minute meet each other in the supreme contests.

Football, as it is played in colleges to-day, is a modification of the Rugby game. This country first saw it at Harvard in 1875. A match was arranged with Yale that year, and the latter was beaten. However, the lesson seemed to have been a good one, for since then Har-

vard's victories over Yale have been few and far between. To Walter Camp, Yale 1880, sometimes called "the father of football" do we owe much for football as it is played to-day. It was due principally to Mr. Camp's efforts that the number of players on a team, and positions were fixed in their present condition. Without going into a discussion, on the roughness of the game, let it be considered that what is rough—nay, brutal—for a man in no condition to play, is merely a trial of strength, courage, and cleverness, in which all unnecessary roughness is eliminated, for the trained athlete.

For years Yale and Harvard had the leading football teams of the country. Then its spirit forced Princeton to the front. A few years later, Woodruff, a great Yale athlete, was employed as a coach at the University of Pennsylvania. Mr. Woodruff had very original ideas, and perfected what was known as the guards back play. With good material, and the guards back play, Pennsylvania became a contender for championship honors, and soon Yale, Harvard, Princeton, and Pennsylvania were known as the "Big Four" in football. In late years, other colleges have become prominent in this branch of sport, notably, Cornell, Columbia, West Point, Dartmouth, and Annapolis.

In the Middle West, seven State universities, the University of Chicago, and Northwestern University have entered into athletic relations, and are known as the Conference Universities, or the "Big Nine." Before 1890 there was practically no football played except in the East. The strides that football has made in the Middle West since then is little short of marvelous. The men who have raised the standard of play in the West are Alonzo A. Stagg, a former Yale athlete; Phil King, the Princeton quarter-back; and Fielding Yost, who learned the game at Lafayette, and Dr. Williams of Yale. Two different years King coached championship teams at the University of Wisconsin, and during the other years of his tutelage, Wisconsin was always one of the leaders. For almost a decade Stagg's teams at the University of Chicago have held good positions in the western football world, and in 1899, Chicago tied with Iowa for the championship of the Middle West. The latter team was coached by Knipe, of Pennsylvania, a former pupil of Woodruff, and he introduced in the West the guard's back play.

It was left for Yost to revolutionize the football of not only the West, but that of the country. Mr. Yost is a coach, none of whose teams have ever lost a game. His work has stood out most prominently at the University of Michigan. In the four years that he has coached there, the teams have won every game played, except one in 1903, a tie with the team of Minnesota, coached by Dr. Williams, a colleague of Stagg at Yale. Unfortunately, of late years there have been no intersectional contests between the elevens representing Eastern universities and those of the Middle West. The easterners claim that their teams are the better and the westerners make as strong a claim for theirs. Of course the question of superiority can never be settled until the leaders in the respective sections meet. To the calm observer it seems that each section could learn something from the other. In the East, the system of training is more methodical. The team is

EDUCATIONAL ATHLETICS

worked up in such a way that it is at its best when it goes against its strongest rival for the last game of the season. As the season is somewhat longer and there are more games to play in the West, the teams cannot be coached in this way, and what is lacking in method is made up in greater variety of play and dash.

All the western teams employ eastern coaches, with the exception of those at the universities of Illinois and Wisconsin, where a graduate system is in vogue. However, at the latter institution the system did not prove a success, and Phil King will again coach the team. Although Mr. Staggs got his training in the East, the system that is being built up at Chicago is that with the graduate in charge. West of the Rockies, both Leland Stanford and the University of California, the two leading seats of learning on the Pacific coast, employ graduates to coach their athletic teams.

After the football season is over, beside work in the gymnasium, there is nothing done in the way of exercise until after the holiday vacation, when the various indoor or gymnasium sports are taken up. The principal winter sport is basket ball and gymnasium work. It is very important, among other things, in that it brings out a part of the student body which takes no part in the other branches of sport. Gymnasium teams practice in tumbling, trapeze, horse, and bar work. Many of the students also take special interest in wrestling, fencing, and boxing. Although there is none or little intercollegiate competition in handball, this beneficial exercise is the principal mode of recreation for a great many of the student body.

Although it is long before the season of competition, the training season of both the baseball and track teams start immediately after the Christmas holidays. Baseball brings out more candidates than any other branch of sport, and the reason for this may readily be seen. Although there are many boys in college who have never played football, or sprinted, there is hardly one, physically able, who has not played the national game. The indoor work in this branch consists of batting, throwing, picking up grounders, and pitching. The squad, which in some instances numbers more than a hundred men, is gradually cut down, so that when they are able to play out of doors, in March, there remains probably enough men to make up two teams, beside the men who are trying for pitching positions.

The strongest football teams in the country are the college teams; the strongest baseball teams are of course the professional organizations. However, the strongest amateur teams in the country are the college teams. There is something about a college game of baseball which one never sees in a game between professional nines. That is, the college man plays the game with more earnestness and spirit than the player on the professional team. The college player receives no pay outside of victory. The game itself is everything to him, while he is playing it, and as a result he plays at top form every minute of the game. This much cannot be said for the professional player.

Now and then there is a player who is really superior to most professional players, and it is not an unusual thing to see college players drift into professional baseball. It is not a very

lofty position for a college-bred man. Certainly, playing professional ball does him no good. In some instances, however, it has done the game good by driving out the rowdiness.

In the East, Brown, Yale, Harvard, Princeton, Georgetown, and Holy Cross have always been among the leading schools in baseball. The baseball squads in almost all of these colleges are coached by professional players. In the West, Illinois and Michigan have divided all the diamond honors in recent years. In 1902, the Illinois baseball team made an invasion of the East and defeated Yale, Princeton, Pennsylvania, and West Point, and was defeated by Harvard by a score of 2 to 1.

Training for a track team starts in the winter. Almost every university gymnasium is fitted up with a running track. There, day after day, the candidates for the team get out and run under the eye of the trainer. Intercollegiate indoor track matches begin as early as February. They take place in the gymnasium, and consist of short dashes, hurdle races, middle and long distance runs, shot put, pole vault, and high jump. To this list is often added a relay race. As soon as the weather is warm enough the track candidates are taken out on the athletic field. During the spring, dual meets are held, and in June, at the end of the collegiate year, a meet is held to which all the track teams of the colleges of a section are invited to compete.

Harvard, Pennsylvania, Yale and Georgetown do the best work on the track in the field among the eastern colleges. In the West Michigan and Chicago usually fight it out for leadership. In a dual meet held in 1904, in Chicago, Princeton won over Chicago by a margin of one point. Taken all in all, the average run of track athletes in the East are a trifle better than those in the West, though the West has turned out several record holders.

The following are the best records made in the respective events by the college track athletes of the country in collegiate meets:

100 yards—9½ s.—A. F. Duffey, Georgetown.
220 yards—21½ s.—B. J. Wefers, Georgetown.
One-fourth mile—41¾ s.—W. Baker, Harvard.
One-half mile—1 m. 53½ s.—C. J. Kilpatrick, Union.
One mile run—4 m. 23½ s.—G. W. Orton, Pennsylvania.
Two mile run—9 m. 40 s.—W. E. Schutt, Cornell.
120 yard hurdles—15½ s.—S. Chase, Dartmouth;
A. C. Kraenzlein, Pennsylvania.
220 yard hurdles—23½ s.—A. C. Kraenzlein, Pennsylvania.
Running high jump—6 ft. 4 in.—W. B. Page, Pennsylvania.
Running broad jump—24 ft. 4½ in.—A. C. Kraenzlein, Pennsylvania.
Pole vault—12 ft. 1 32-100 in.—Norman Dole, Leland Stanford.
Throwing 16 lb. hammer—166 ft. 5 in.—J. R. De Witt, Princeton.
Putting 16 lb. shot—47 ft. 8½ in.—Ralph Rose, Michigan.
Discus throw—125 ft. 3¼ in.—Ralph Rose, Michigan.

Besides the sports already mentioned, rowing takes an important place in the athletic catalogue of many universities. Perhaps a man has to train longer and more strenuously to make a college crew than if he went into any other branch of sport. Often the man on the crew starts to work in September and continues throughout the entire college year. The swimming tank in the gymnasium leads to many

EDUCATIONAL ORGANIZATION AND ADMINISTRATION

water games, such as racing, diving, water polo, etc., all of which tend to mould a man along healthful lines. Lawn tennis occupies a very important place in college athletics. It is one of the most beneficial sports we have, but as it is not a game which is very interesting to spectators, it will never rank with football, baseball, rowing or track athletics as an intercollegiate sport. Golf is being taken up more and more by the colleges and this most excellent game will increase in popularity, and we will hear of many intercollegiate matches where now there are but few.

The good of athletics in institutions of learning is incalculable. Between classes and lectures, when there is nothing to take up the student's mind, the temptations are manifold. If he is of a studious disposition, there is the danger of excessive sedentary life. If he is not studiously bent, there are many temptations to attract the idle. If he is of a weak constitution, disease and its consequences soon follow; if he is robust, although he may stave them off longer, the consequences are the same. Then again, the athletic field is a place where all classes of students can meet on a common ground. It is the place where they can get rid of a superabundance of youthful enthusiasm. As a result, the town and gown riots, which formerly characterized every college town, are things of the past. One is thus inclined to agree with an eminent college president when he said, "the athletic field does more toward keeping order in the student body than all our rules and regulations combined."

GEORGE A. HUFF,

Director of Phys. Training, Univ. of Illinois.

Educational Land Grants. See COLLEGES, LAND GRANTS.

Educational Military System. The system of military education that is provided in the United States is materially different from that which prevails in other countries. The foundation of this system is supplied by the United States Military Academy at West Point, but the practical education of the soldier, according to the American system, has only just begun when he obtains his certificate of graduation from the military school. The various posts have their officers' schools for instruction in theory and practice and these are attended by such graduates as may not have been assigned to one of the special service schools of application. These are the artillery school at Fort Monroe; the school for engineers at the Washington, D. C., barracks; the special school for cavalry men and infantry men at Fort Riley, Kan.; the institution for instruction in submarine defense at Fort Totten, N. Y.; and the army medical and dental schools at Washington, D. C. The courses at each of these schools is one or two years, and, as far as possible in that length of time, the students are trained by methods of practical application in the special work that distinctively applies to their particular branch of the service. In addition to these schools, however, there is the General Service and Staff College at Leavenworth, Kan., all under the direction of experienced army officers, and the War College at Washington, another institution organized to fit officers for service on the general staff.

A general supervision over all the different

military schools is maintained by the War College Board, and the recognition of the value of the citizen-soldier in time of war has led the War Department to declare that all officers' schools at the military posts as well as the General Service and Staff College at Leavenworth, shall be open to National Guard and volunteer officers as well as to those who have graduated from the recognized military academies and colleges. See MILITARY ACADEMY, UNITED STATES; MILITARY SCHOOLS.

Educational Organization and Administration.

The first white settlers who came to America were from the more civilized European peoples, who had already made some progress in the direction of popular education. The most potent influences upon American civic institutions were English and Dutch. English colleges and fitting schools were maintained for the training of young men of noble birth for places under the government and in the government church, but there were no common schools for all. The Dutch had gone farther than the English; they had just waged a war for civil and religious liberty which had enlarged their freedom and quickened their activities; they had become the greatest sailors and the foremost manufacturers in the world; and they had established the government policy of maintaining not only colleges, but common schools for all. English and Dutch each brought their national educational ideas with them. The English colony in Massachusetts followed the English educational policy; and set up a college to train their aristocracy for places in the state and the church. The Dutch, more dependent upon their government over the sea, at once set up elementary schools at public cost and common to all. In a few years the English overthrew the little Dutch government and almost obliterated the elementary schools. For a century the English royal governors and the Dutch colonial legislatures struggled over the matter of common schools. The government was too strong for the humble people; little educational progress was made. Near the close of that century the government established King's College to educate sons of noble birth and prevent the spread of republican ideas. The Revolution of 1776 changed all. In fighting together for national independence the different peoples assimilated and became Americans in the new sense. They realized that education must be encouraged, and, so far as practicable, made universal under a democracy in which the rights of opportunity were to be equal. But they began to be interested in education because they saw that schools would help the individual and so promote virtue and extend religion. It did not occur to them at first that the safety of the new form of government was associated with the diffusion of learning, for the suffrage was not universal at the beginning of independent government in America. Therefore, it was understood to be the function of parents to provide education for their children. Schools were partnership affairs between people who had children in their care. They apportioned the expense among themselves. But it was soon seen that many who had children to educate would neglect them to avoid contributing to the support of the school. Besides the schools were very indifferent affairs. If they were to be of any account they must have

EDUCATIONAL ORGANIZATION

recognition and encouragement from government. Encouragement was given by official and legislative declarations in their behalf and by authorizing townships to use various surplus funds for the benefit of the schools. It was a greater step for the townships to require parents and guardians to maintain schools, and a still greater one to adopt the principle that every child was entitled to an elementary education, that this was for the safety of the state, that therefore the state was bound to see that schools were provided for all, and that all the property of all the people should contribute alike to their support. Perhaps it was even a greater step to provide secondary and collegiate, and in many cases professional and technical, training at the public cost.

Although there was no educational system in the United States at the beginning of the 19th century, there is now one throughout the country, free and flexible, adaptable to local conditions, and with the elements of a complete and symmetrical system. The parts of this system may be designated as follows:

- (a) Free public elementary schools in reach of every home in the land.
- (b) Free public high schools, or secondary schools, in every considerable town.
- (c) Free land grant colleges, with special reference to the agricultural and mechanical arts, in all the States.
- (d) Free State universities in practically all of the southern States and all the States west of Pennsylvania.
- (e) Free normal schools, or training schools for teachers, in practically every State.
- (f) Free schools for defectives, in substantially all of the States.
- (g) National academies for training officers for the army and navy.
- (h) A vast number of private kindergartens, music and art schools, commercial schools, industrial schools, professional schools, denominational colleges, with a half dozen leading and privately endowed universities.

This educational system is held in the control of the people, and so far as practicable in the control of local assemblages. In spite of modern tendencies toward centralization of management, the conspicuous characteristic of the system has always been that elementary and secondary schools are largely controlled and directed by each community.

The School District.—The "school district" is the oldest and the most primary form of school organization, and the smallest civil division of our political system. It resulted from the disposition of neighboring families to associate for the maintenance of a school. Later it was recognized by law. It ordinarily accommodates but a few families, and is better adapted to the country than to town or city. The "district system" is in operation in most of the States; in New York there are more than 11,000 and in Illinois more than 12,000 school districts. Their government is the most simple and democratic that can be imagined. It is controlled by school meetings held annually or oftener and composed of resident legal voters, in many of the States including women, especially of property holders. These meetings vote repairs and appliances for the school, erect new schoolhouses, and elect officers, one or more, commonly called trustees or directors, who are required to em-

ploy the teacher and have general oversight of the school. Although much has been said against the district system, it cannot be denied that the system has had much to commend it, for it suits the conditions of country life; makes schools adapted to the thought and wants of the people; educates the people themselves in civic spirit and patriotism; and affords a meeting-place for the people. The district school ordinarily has been as good as a free and primitive people would sustain or could profit by. The teachers have generally been young and inexperienced, but never mere mechanical automatons, and as a rule they have proved makers of opinion and leaders of action upon a considerable field. Certainly the work has lacked system, continuity and progressiveness, but the pupils have not suffered seriously, in comparison with the children living in the towns. The district system has sufficed well for them and it is to be spoken of with respect, for it has exerted a marked influence upon our citizenship, and has given strong and wholesome impulses in all the affairs of the nation.

The Township System.—In the first half of the last century the general educational purpose was to perfect the district system; the tendency in the latter half was unmistakably to merge it into an organization covering a larger area, and capable of larger undertakings. The cause of this has been the desire for larger schools, taught by teachers better prepared, and capable of broader and better work, and a purpose to distribute educational advantages more evenly. Accordingly, in most of the States the township system has already supplanted the district organization. The township system makes the township the unit of school government. It is administered by officers chosen at annual town meetings, or sometimes by central boards, the members of which are chosen by the electors of different sub-districts. In any event, the board has charge of all the elementary schools of the township, and of the township high school, if there is one. The board provides buildings and cares for them, supplies the furnishings and appliances, employs teachers, and regulates the general operations of the schools. Of course the township system is much less formally democratic and much more centralized than the district system. It has doubtless produced better schools and schools of more uniform excellence. One of its most beneficent influences is the multiplication of township high schools.

It has many advantages over the district system for a people who are ready for it, and it is a step toward that general centralization in management and greater uniformity of method so manifest throughout the school system of the United States.

The County System.—The southern States, for the most part, have a county system of school administration. This has resulted from the general system of county government prevalent in the southern States and easily traceable to historic causes.

The county system is not constituted identically in all of the southern States of the Union. In Georgia, for example, the grand jury of each county selects from the freeholders five persons to comprise the county board of education; in North Carolina the justices of the peace and county commissioners of each county appoint

EDUCATIONAL ORGANIZATION

such a county board of education; in Florida such a board is elected by the people biennially; and elsewhere a county commissioner or superintendent of schools is the responsible authority for managing the schools of the county. In any case the unit of territory for the administration of the schools is the county, and county officials locate sites, provide buildings, select text-books, prescribe the course of work, examine and appoint teachers, and do all the things which are within the functions of district or township trustees or city boards of education in the northern States.

The City School Systems.—In cities where it is difficult for people to meet to fix the policies and manage the business of the schools, or to choose officers to manage the schools, the State legislatures make special laws for city schools. In some States these laws are uniform for all cities of a certain population, but more often each city has gone to the legislature and procured the enactment of such statutes as seemed suited to the immediate circumstances, so that there is no uniform or general system of public school administration in the American cities. But in nearly every case there is a board of education charged with the management of the schools; these boards differ in constitution and in legal functions in different cities. Usually boards of education are elected by the people, on a general city ticket, or by wards or sub-districts; and either at a general or municipal election, or at special elections. But in the larger cities, the board is appointed by the mayor, or by mayor and city council. In a few instances it is appointed by the city councils. It must be said that there has been much dissatisfaction with the way school affairs have been managed in the larger cities, where there have been many and serious complaints of misuse of funds, of neglect of property, of appointment of unfit teachers, and of general incapacity, or worse, on the part of the boards. All this has come from the amounts of money that are involved and the number of appointments that are constantly to be made. More than \$100,000,000 is paid annually for teachers' wages alone in the United States. People who are needy have sought positions as teachers without much reference to preparation, and the kindly disposed have aided them without any apparent appreciation of the injury they were doing to the highest interests of their neighbors. Men engaged in managing the organizations of the different political parties have undertaken to control appointments in the interests of their party machines. And downright scoundrels have infested the school organization in some places for the sake of plunder. As cities have grown in size and multiplied in numbers the more scandal there has been. But so has the determination of the people strengthened to remedy difficulties.

Especially important is a report of the Committee of Fifteen of the National Educational Association, which closes with the following suggestions:

First. The affairs of the school should not be mixed up with partisan contests or municipal business.

Second. There should be a sharp distinction between legislative functions and executive duties.

Third. Legislative functions should be clearly fixed by statute and be exercised by a comparatively small board, each member of which is representative of the whole city. This board, within statutory limitations, should determine the policy of the system, levy taxes, and control the expenditures. It should make no appointments. Every act should be by a recorded resolution. It seems preferable that this board be created by appointment rather than election, and that it be constituted of two branches acting against each other.

Fourth. Administration should be separated into two great independent departments, one of which manages the business interests and the other of which supervises the instruction. Each of these should be wholly directed by a single official who is vested with ample authority and charged with full responsibility for sound administration.

Fifth. The chief executive officer on the business side should be charged with the care of all property and with the duty of keeping it in suitable condition: he should provide all necessary furnishings and appliances: he should make all agreements and see that they are properly performed: he should appoint all assistants, janitors, and workmen. In a word, he should do all that the law contemplates and all that the board authorizes, concerning the business affairs of the school system, and when anything goes wrong he should answer for it. He may be appointed by the board, but it is preferable that he be chosen in the same manner as the members of the board and be given a veto upon the acts of the board.

Sixth. The chief executive officer of the department of instruction should be given a long term and may be appointed by the board. If the board is constituted of two branches, he should be nominated by the business executive and confirmed by the legislative branch. Once appointed he should be independent. He should appoint all authorized assistants and teachers from an eligible list to be constituted as provided by law. He should assign to duties and discontinue services for cause, at his discretion. He should determine all matters relating to instruction. He should be charged with the responsibility of developing a professional and enthusiastic teaching force, and of making all the teaching scientific and forceful. He must perfect the organization of his department and make and carry out plans to accomplish this. If he cannot do this in a reasonable time he should be superseded by one who can.

In the present scheme the powers of the city boards of education are very broad, almost without limits as to the management of the schools. They do everything but decide the amount of money which shall be raised for the schools, and sometimes do that. Of course these independent and large prerogatives are exceedingly advantageous to educational progress when exercised by good men; but it is not to be disguised that in some of the foremost cities they have fallen into hands which are corrupt, but more often into the hands of men who do not see the importance of applying pedagogical principles to instruction, and who are used by designing persons for partisan, selfish or corrupt purposes. But notwithstanding all hindrances, the issue is being joined and the battle will be

EDUCATIONAL ORGANIZATION

fought out to a successful result. There can be but one outcome. The forces of decency and progress always prevail in the end.

The demands of the friends of popular education in our great cities are for a plan of organization separating legislative and executive functions, putting the interests of teachers upon the merit basis and leaving them free to apply pedagogical principles to the instruction, giving large authority to officers and teachers, but locating responsibility and ousting the incompetent or corrupt.

The States and the Schools.—Since the American school system is supported wholly by taxation, it depends upon the exercise of a sovereign power. The provision and supervision of schools is a power lodged in the State, and the school system has a legal organization peculiar to each State. This dependence upon State authority has developed a system which tends toward the equalization of school privileges within each State. Of the improvement brought about by intervention on the part of the State in local control, there can be no doubt. In many cases State school funds have been created, or large sums are raised by general levy each year, which are distributed so as to give the most aid to the sections which are poorest and most need it. In the State of New York, for example, the cities pay more than \$500,000 every year to the support of the schools in the country districts. Moreover, excellent normal schools and, in the South and West, great State universities are sustained as parts of the State school systems. In 10 universities of the north-central division of States there are more than 20,000 in college and professional courses, and the work is of as high grade and of as broad range as in the oldest universities of the country. These things exert strong influences upon the sentiment of the people and increase their respect for the State authority over schools. The application of State authority to all schools supported by public moneys of course makes them better and more alike. Whims of local settlements disappear. Schoolhouses are better. More is done for the preparation of teachers, and more uniform exactions are put upon candidates for the teaching service. The courses of study are more quickly and symmetrically improved. There is criticism and stimulus from a common centre for all of the educational work of the State. The different States have gone to very different lengths in exercising their authority. The State government has, of course, not been disposed to go farther than the people were willing, for all government is by the people. The thought of the people in the different States has been somewhat influenced by considerations which arise out of their early history, but doubtless in most cases it is predicated upon their later experiences.

All State constitutions now contain provisions relating to popular education. This was not true of the original constitutions of the older States, for when they were adopted the maintenance of schools was looked upon as a personal or local rather than a State concern. But later amendments introduced such provisions into all older State constitutions. And all newer ones contained strong and elaborate sections, making it a fundamental duty of the government they establish to encourage education and provide schools for all. All the States

have legislated much in reference to schools, and there is scarcely a session of one of the State legislatures in which they do not receive considerable attention. In all the States there is some sort of a State school organization established by law. In practically all there is an officer known as State superintendent of public instruction, or State school commissioner. In some there is a State Board of Education. In New York there is a State Board of Regents in charge of private academies, in some measure of public secondary schools, and of all higher institutions; and also a State Superintendent of Public Instruction, with authority over the elementary schools and in a large measure over the public high schools. The officer last referred to is probably vested with larger authority than any other one educational official in the country. He apportions the State school funds; determines the conditions of admission, the courses of work, and the employment of teachers; audits accounts of the 12 normal schools of the State; has unlimited authority over the examination and certification of teachers; regulates the official action of the school commissioners in all of the assembly districts of the State; appoints teachers' institutes, arranges the work, names the instructors, and pays the bills; determines the boundaries of school districts; and provides schools for the defective classes and for the seven Indian reservations yet remaining in the State. Besides he may condemn schoolhouses and require new ones to be built; and may direct new furnishings to be provided. He is a member of the State Board of Regents and of the board of trustees of Cornell University. He may entertain appeals by any person conceiving himself aggrieved from any order or proceeding of local school officials, determine the practice therein, and make final disposition of the matter in dispute, and his decision cannot be "called in question in any court or in any other place." All this, with the splendid organization of the State Board of Regents, provides New York with a more complete and elaborate educational organization than any other American State. Some think it more elaborate and authoritative than necessary. Certainly it is exceptional among the States, for most of them undertake to regulate school affairs very little, and usually the State Board of Education only controls the purely State educational institutions, and the principal functions of the leading educational official of the State are to inspire action, gather statistics, and disseminate information. However, there can be no doubt that the general tendency is toward greater centralization. The overwhelming current of legislation and of the decisions of the courts is making it imperative, being practically in accord, and to the effect that in each State the school system is not local, but general; not individual schools controlled by separate communities, but a closely related system of schools which has become a State system and is entirely under State authority; and holding local school officials as agents of the State for the administration of a State system of education. The granting of aid by the State implies the right of the State to name the conditions upon which the aid shall be received, and the duty to see that the exercise of such powers shall result in equal advantages to all. Despite of differences all the States ap-

EDUCATIONAL ORGANIZATION

preciate the fact that a constitutional self-governing state exists for the moral and intellectual advantage of every citizen. They have employed and will continue to employ different methods; but all have the highest authority and the supreme responsibility in the matter. And it is the purpose of the people and the law of most of the States not only that such educational opportunities shall be provided for every American child, but that every one shall be required to take advantage of them. Compulsory attendance laws have been enacted in most of the States. These are not as carefully framed as a good knowledge of educational administration might very easily lead them to be, and they are not as completely enforced as the true interests of many unfortunate children require. The right of compulsory education on the part of the State has met with considerable opposition and is still a much disputed question.

General Government and Education.—The Federal government has never exercised any control over the public educational work of the country. But it has never been indifferent thereto. It has shown its interest at different times by generous gifts to education and by the organization of a bureau of education to gather and disseminate the fullest information from all the States, and from foreign nations. The gifts of the United States to the several States to encourage schools have been in the form of land grants from the public domain. In the sale of public lands the practice of reserving one lot in every township "for the maintenance of public schools within the township" has uniformly been followed. In 1786 officers of the Revolutionary army petitioned Congress for the right to settle territory north and west of the Ohio River. A committee reported a bill in favor of granting the request, which provided that one section in each township should be reserved for common schools, one section for the support of religion, and four townships for the support of a university. This was modified so as to give one section for the support of religion, one for common schools, and two townships for the support of a "literary institution to be applied to the intended object by the legislature of the State." This provision, coupled with the splendid declaration that "religion, morality, and knowledge being necessary to good government and the happiness of mankind, schools and the means of education shall forever be encouraged," foreshadowed the general disposition and policy of the central government and made the "Ordinance of 1787 for the government of the Northwest Territory" famous. The precedent here established became national policy, and after the year 1800 each State admitted to the Union, with the exception of Maine, Texas, and West Virginia, received two or more townships of land for the founding of a university. In 1836 Congress passed an act distributing to the several States the surplus funds in the treasury. In all \$28,101,645 was so distributed, and in a number of the States this was devoted to educational uses. But the most noble, timely, and carefully guarded gift of the Federal government was embodied in the Land Grant Act of 1862 for colleges of agriculture and the mechanic arts, which gave to each State 30,000 acres of land for each senator and representative in Congress to which

the State was entitled under the census of 1860, for the purpose of founding "at least one college where the leading object shall be, without excluding other scientific and classical studies, and including military tactics, to teach such branches of learning as are related to agriculture and the mechanic arts, in such manner as the legislatures of the States shall respectively prescribe, in order to promote the liberal education of the industrial classes in the several pursuits and professions of life." This act has been added to by other congressional enactments and the proceeds of the sales of lands have been generously supplemented by the State legislatures until great peoples' colleges and universities have arisen in all of the States.

The work of the United States Bureau of Education is a most exact, stimulating, and beneficent one. Without exercising any authority, it is untiring and scientific in gathering data, in the philosophic treatment of educational subjects, and in furnishing the fullest information upon every conceivable phase of educational activity to whomsoever would accept it. It has become the great educational clearing-house of the world. Its commissioners have been eminent men and great educational leaders.

Private Institutions.—Besides public schools there is a large number of other schools which comprise an important part of the educational system of the country and are of course subject to its laws. Any statement concerning American school organization and administration, even of the most general character, would be incomplete which did not cover these. In the first half of the last century many private "academies" or "seminaries" sprang up where the country had become at all settled. This was in response to a demand from people who could not get what they wanted in the common schools. A teacher with a little more than ordinary gifts could open one of these private schools and soon have an abundance of pupils and a profitable income. But most of these schools served their purpose and gave way to new public high schools. Some remain and continue to meet the desires of certain families who prefer their somewhat exclusive ways. A considerable number have been adopted by their States and developed into State normal schools, and not a few have by their own natural force grown into literary colleges. In recent years innumerable schools have arisen out of private enterprise. Every conceivable interest, professional, technical, industrial, and commercial, has produced a school to promote its own ends.

All such schools operate independently of the States in which they exist. The States do not interfere with them, as they ask no public support. Some of them hold charters granted by the legislature, and more secure recognized standing by organizing under general corporation laws enacted to cover all such enterprises. In some cases the States distribute public moneys to some of these institutions by way of encouragement, and perhaps impose certain conditions upon which they shall be eligible to share in such distributions. But ordinarily a State does no more than protect its own good name against occasional impostors. New York, for example, has prohibited the use of the name "college" or "university" except when the requirements of the State Board of Regents are met. All reputable institutions

EDWARD THE ELDER — EDWARD

desire reasonable supervision, for it certifies their respectability and constitutes them a part of the public educational system of the State.

Expert Supervision.—From the beginning the laws have provided methods for certifying persons deemed to be qualified to teach in the schools. This has ordinarily been among the functions of State, city, and county superintendents or commissioners. Sometimes boards of examiners have been created whose only duty was to examine and certificate teachers. The function of certifying and that of employing teachers have, for obvious reasons, not commonly been lodged in the same officials. Superintendents began to be provided for by law in the early part of the 19th century. The first State superintendency was established by New York in 1812. Other States took similar action in the next 30 years. Town, city, and county superintendencies came along rapidly, and by or soon after the middle of the century had been set in operation in most parts of the then settled country. The main duty of these officials in the earlier days was to examine candidates for teaching, report statistics, and make addresses on educational occasions. In later years, however, they are held in considerable measure responsible for the quality of the teaching. In country districts superintendents hold institutes, visit schools, commend and criticise the teaching, and exert every effort to promote the efficiency of schools, so that a discreet and active county superintendent comes to exert almost a controlling influence over the school affairs of his county. In the cities, and particularly the larger ones, the problem is much more difficult. Because of the greater number of teachers, the task of securing uniform excellence is much enlarged. The schools are less homogeneous and instruction less easy. Frequently the superintendent cannot know the personal qualities of each teacher, or even visit all of the schools. Yet a system must be organized which, through the aid of assistants, will advise the superintendent's office fully of the work of every teacher. All teachers must be upon the merit basis, the most deserving must be advanced in rank and pay as rapidly as practicable, and the weak must be helped and trained into efficiency or removed from their positions. The laws are coming to recognize the responsibilities and difficulties of the superintendent's position, and are continually throwing about that officer additional safeguards and giving him larger powers and greater freedom of action. And the good cause of education against political manipulation is making substantial progress. The law books of all of the States show provisions recognizing the professional school superintendent; in many of the States they contain provisions directing and protecting his work; and in some they confer upon him entire authority over the appointment, assignment and removal of teachers, and impose upon him entire responsibility for the quality of the teaching. It is this professional supervision which has given the American schools their peculiar spirit. As the people have come to know the worth of good teaching they have favored closer supervision over the teaching. All this is yearly becoming more and more apparent in the laws, and it is advancing the great body of American teachers along philosophical lines more steadily and rapidly than

any other great body of teachers in the world is advancing.

In conclusion a few facts touching the great school system, the legal organization of which we have briefly tried to sketch, and which has produced that organization and in turn has in part been produced by it, will be of interest. The enrolment of pupils in the State common schools alone in 1899-1900 was nearly 15,350,000. These schools were kept open an average of 140.5 days in the year. The number of teachers employed was more than 420,000, and the running expenses for the year about \$213,000,000. Laws making attendance at school compulsory have been enacted in 32 States and Territories.

The United States Bureau of Education, to which I am indebted for the foregoing figures and much other information, is aided by a corps of 15,000 voluntary correspondents who furnish printed reports and catalogues and cheerfully answer the bureau's inquiries upon every phase of educational work.

It is of course difficult for one not familiar with American institutions and American ways to understand or appreciate the American school system. To him it seems anything but a system. It is a product of conditions in a new land, and it is adapted to those conditions. It is at once expressive of the American spirit and it is energizing, culturing and ennobling that spirit. It is settling down to an orderly and symmetrical institution, it is becoming scientific, and it is doing its work efficiently. It exerts a telling influence upon every person in the land, and is proving that it is supplying an education broad enough and of a kind to support free institutions.

ANDREW SLOAN DRAPER,
Commissioner of Education, State of New York.

Edward the Elder, king of England: b. about 870; d. Farndon, Northamptonshire, 925. He was a son of Alfred the Great, and succeeded his father in 901. Ethelwald, the son of his father's elder brother, claimed the crown; and an insurrection took place in his favor, but it ended with the death of Ethelwald in battle. The reign of Edward was further distinguished by successes over the Anglicized and foreign Danes. He fortified many inland towns, acquired dominion over Northumbria and East Anglia, and subdued several of the Welsh tribes.

Edward (surnamed the "MARTYR"), king of England: b. about 963; d. Corfe Castle 18 March 979. He was a son of Edgar, and succeeded his father in 975. His stepmother, Elfrida, wished to raise her own son, Ethelred, to the throne, but was opposed by Dunstan through whose exertions Edward was peaceably crowned. His short reign was chiefly distinguished by the disputes between Dunstan and the foreign monks on one side, and the secular clergy on the other. Hunting one day in Dorsetshire he was separated from his attendants, and repaired to Corfe Castle, where Elfrida resided. He requested a glass of liquor, and as he was drinking on horseback one of Elfrida's servants gave him a deep stab behind. He immediately set spurs to his horse, but, fainting from loss of blood, was dragged in the stirrup until he died. The pity caused by his innocence and misfortune induced the people to regard him as a martyr.

EDWARD

Edward (surnamed the "CONFESSOR"), king of England: b. Islip, Oxfordshire, about 1004; d. 5 Jan. 1066. He was a younger son of Ethelred II. On the death of his maternal brother, Hardicanute the Dane, in 1041, he was called to the throne, and thus renewed the Saxon line. He was not the immediate heir, as his brother, Edmund Ironside, had left sons; but as he received the support of Godwin, earl of Kent, on condition of marrying his daughter, Editha, his claim was established. Edward was a mild and virtuous prince, who acquired the love of his subjects by his sanctity and care in the administration of justice. Having been educated in Normandy he introduced so many natives of that country to his court that the French language and manners became prevalent in England to the great disgust of Earl Godwin and his sons. A rebellion took place, and Edward was forced to dismiss his foreign favorites. Perceiving that the youth and weakness of his chosen heir, Edgar Atheling (q.v.), would not secure the succession against the power and ability of Harold, the son of Godwin, he turned his eyes upon his kinsman, William of Normandy, in whose favor it has been asserted that he executed a will. He died leaving the point of the succession undetermined; and with him ended the Saxon line of kings. He caused a body of laws to be compiled from those of Ethelbert, Ina, and Alfred, which is the supposed source of the common law of England. He was canonized by Alexander III. in 1166.

Edward I., king of England: b. Westminster 17 or 18 June 1239; d. Burgh-le-Sands, near Carlisle, England, 7 July, 1307. He was a son of Henry III., and the contests between his father and the barons called him early into active life, and he finally quelled all resistance to the royal authority by the decisive defeat of Leicester, at the battle of Evesham, in 1265. He then proceeded to Palestine, where he inspired so much terror that an assassin was employed to despatch him, from whom he received a wound in the arm, which, as tradition reports, being supposed to be from a poisoned weapon, was sucked by his faithful consort, Eleanor of Castile. On assuming the government he acted with great vigor in the repression of the lawlessness of the nobles and the corruption in the administration of justice; but often evinced an arbitrary and grasping disposition. In 1274, and again in 1276, he summoned Llewellyn, prince of Wales, to do him homage, and upon his refusal, except on certain conditions, began the war which ended in the annexation of that principality to the English crown in 1283. Edward then spent some time abroad in mediating a peace between the crowns of France and Aragon, and on his return commenced his attempts to destroy the independence of Scotland. After his return from the Scottish expedition in 1296, which terminated in the capture of Baliol, he became involved in a quarrel with his clergy, who, supported by the Pope, refused to submit to a tax which he had imposed on them. Edward forced their compliance by placing them out of the protection of the law. His frequent expedients to raise money at length produced great discontent among the nobles and people also, which obliged him to confirm the great charter and charter of forests, and also to give other securities in favor of public liberty. He

then made a campaign in Flanders against France, which terminated with the recovery of Guienne and his second marriage with Margaret, the sister of King Philip. Meantime new commotions took place in Scotland under the guidance of the celebrated William Wallace. These transactions recalled Edward from Flanders, who hastened to the border with an army of 100,000 men. The ignominious execution of the brave Wallace, in 1305, as a traitor, forms a blot in the character of Edward. Neither did it avail, since Robert Bruce was able, in 1306, to place himself at the head of a new confederacy. Indignant at this determined spirit of resistance Edward vowed revenge against the whole Scottish nation, and, assembling another army, was on the point of passing the border when he was arrested by sickness and death. Few princes have exhibited more vigor in action, or policy in council, than Edward I. His enterprises were directed to permanent advantages rather than to mere personal ambition and temporary splendor. Nor was he less intent upon the internal improvement of his kingdom than its external importance. The laws of the realm obtained so much additional order and precision during his reign that he has been called the "English Justinian." He passed an act of mortmain, protected and encouraged commerce; and in his reign first originated the society of merchant adventurers. The manners of this able sovereign were courteous, and his person majestic, although the disproportionate length of his legs gave him the popular surname of "Longshanks." He left a son and three daughters by his first wife, Eleanor, who died in 1290, and two sons by his second wife, Margaret of France. See Stubbs, 'The Early Plantagenets' (1877); Tout, 'Edward I.' (1893).

Edward II., king of England: b. Caernarvon Castle in 1284; d. Berkeley Castle 21 Sept. 1327. He was the first English Prince of Wales and succeeded his father, Edward I., in 1307. He was of an agreeable figure and mild disposition, but indolent and fond of pleasure. His first step was to recall Piers Gaveston, a young Gascon, whom his father had banished, and whom he created Earl of Cornwall, and married to his niece. He then went to France to espouse the Princess Isabella, to whom he had been contracted by his father, leaving Gaveston guardian of the realm. Soon after his return the barons associated against the favorite, whom they more than once obliged the king to send away. He was, however, as constantly recalled when the immediate danger was over, until an open rebellion took place; and the person of Gaveston being captured, he was executed as a public enemy. In 1314 Edward assembled an immense army to check the progress of Robert Bruce, but was completely defeated at Bannockburn. After the death of Gaveston he selected another favorite, Hugh le Despenser, upon whom he lavished favors of every kind, until the barons again rebelled, and the Parliament dooming Despenser and his father to exile, the king was obliged to confirm the sentence. Edward, however, on this occasion, in concert with the Despensers, contrived to raise troops and attack the barons, at the head of whom was his cousin, the Earl of Lancaster, who, being taken prisoner, was executed at Pomfret. Edward subsequently made another fruitless attempt against

EDWARD

Scotland, which ended in the conclusion of a truce of thirteen years. In 1324 Queen Isabella went to France, and while there entered into a correspondence with several English fugitives, in whose hatred to the Despensers she participated. Among these was Roger Mortimer, a young baron of the Welsh marches, between whom and Isabella a criminal intercourse followed, in consequence of which the queen was still more determined upon the ruin of her weak and unhappy husband. Having formed an association with all the English malcontents, and aided with a force by the Count of Hainault, she embarked for England in September, 1326, and landed in Suffolk. Her forces seized the Tower of London and other fortresses, captured and executed both the Despensers without trial, and at length took the king prisoner. Edward was confined in Kenilworth Castle, and in January 1327, his deposition was unanimously voted in Parliament, on the ground of incapacity and misgovernment. A resignation of the crown was soon after extorted from him, and he was transferred to Berkeley Castle, where Mortimer despatched two ruffians, who murdered him, in the 20th year of his reign and 43d of his age.

Edward II., an historical tragedy by Christopher Marlowe (1598). It follows history closely in its main lines and is a drama as powerful as it is painful.

Edward III., king of England: b. Windsor 13 Nov. 1312; d. Richmond, Surrey, 21 June 1377. He was a son of Edward II., and on his father's deposition in 1327, was proclaimed king under council of regency, while his mother's paramour, Mortimer, really possessed the principal power in the state. The pride and oppression of Mortimer now became so intolerable that a general confederacy was formed against him. The result was the seizure of Mortimer, who was tried and condemned by a parliament at Westminster, and was executed 29 Nov. 1330. The queen, although treated with outward respect, never again during the remaining 28 years of her life recovered any degree of authority. Edward now turned his attention to Scotland. Assisted by some principal English nobles, Edward Baliol, son of the John Baliol to whom the crown had been awarded by Edward I., raised a force, and defeating the Scots in a great battle, set aside David Bruce, then a minor, and was crowned at Scone in 1332. Baliol being driven away on the departure of his English auxiliaries, applied to Edward, who defeated the regent, Douglas, at the famous battle of Halidon Hill, in July 1333. This victory produced the restoration of Baliol, who was, however, again expelled, and again restored, until the ambition of Edward was called off by a still more splendid object. The crown of France, by the Salic law, having devolved to Philip de Valois, cousin-german to the deceased king Charles the Fair, Edward was induced to claim it in right of his mother, that monarch's sister. Edward, in order to obtain supplies, made concessions to Parliament which he never intended to keep; and finding his territory of Guienne threatened, sent over a force for its defense, and quickly followed himself, accompanied by his son Edward, the famous Black Prince, all his chief nobility, and 30,000 men. The memorable battle of Crécy

followed, 25 Aug. 1346, succeeded by the siege of Calais. In the meantime, David Bruce, having recovered the throne of Scotland, made an incursion, at the head of a large army, into England; but being met at Durham by a much inferior force, raised by Queen Philippa, and headed by Lord Percy, was totally defeated and taken prisoner, with many of his principal nobles. Philippa went over to her husband at Calais, and, by her interference prevented the barbarous execution of Eustache de St. Pierre and five other citizens, whom Edward, on the capitulation of the place, had determined to execute, in revenge for his long detention in the siege. In 1348 a truce was concluded with France. The year 1349 was distinguished by the institution of the order of the Garter, which soon became one of the most illustrious orders of knighthood in Europe. Philip, king of France, dying in 1350, was succeeded by his son John, the commencement of whose reign abounded with intestine commotion, and in 1355 Edward again invaded France on the side of Calais, while the Black Prince at the same time led a large army from Gascony. Both these expeditions were attended with much plunder and devastation; and Edward, being recalled home by a Scottish inroad, soon repelled it, and retaliated by carrying fire and sword from Berwick to Edinburgh. During this time the Prince of Wales had penetrated from Guienne to the heart of France, where he was opposed by King John, at the head of an army nearly five times more numerous than that of the English. The famous battle of Poitiers ensued, in which the French monarch being taken prisoner, Edward held at the same time in captivity the kings of France and Scotland, the most dangerous of his enemies. John was taken to England and treated with the greatest respect; and David was soon after liberated upon ransom. A truce had been made with France after the battle of Poitiers, at the expiration of which, in 1359, Edward once more passed over to Calais with a large army, but at length consented to a peace. Besides the stipulation of a large ransom for King John, several provinces and districts in the southwest of France and neighborhood of Calais were yielded to Edward, who in turn resigned his title to the crown of France and duchy of Normandy. The successor of John, Charles V., invaded the provinces entrusted to Prince Edward, then in the last stage of declining health, and Edward had the mortification of witnessing the gradual loss of all his French possessions, except Bordeaux and Bayonne, and of all his conquests except Calais. See Longman, 'Life and Times of Edward III.' (1869); Mackinnon, 'History of Edward III.' (1900).

Edward IV., king of England: b. Rouen, France, 29 April 1441; d. 9 April 1483. His father, Richard, Duke of York, was grandson of Edward, Earl of Cambridge, and Duke of York, fourth son of Edward III., while the Lancaster branch descended from John of Gaunt, the third son. The York line had intermarried with the female descendants of Lionel, the second son, which gave it the preferable right to the crown. Edward, on the defeat and death of his father at the battle of Wakefield, assumed his title, and having entered London after his victory over the Lancastrians at Mortimer's Cross, in Febru-

EDWARD

ary 1461 was declared king by acclamation. Soon after his accession he had to fight for his crown against an army of 60,000 Lancastrians, assembled in Yorkshire; and the field of Towton confirmed his title by a decisive victory. Although the high-spirited Margaret was enabled by the aid of Louis XI. of France again to take the field, the result of the battle of Hexham, in May 1464, obliged her to return to Flanders, and leave her husband, the imbecile Henry VI., a prisoner in the hands of his enemies. By a marriage with Elizabeth Woodville, widow of Sir John Grey of Groby, a Lancastrian, Edward plunged himself into very serious difficulties, since at the same time he had despatched the Earl of Warwick to negotiate a marriage for him with Bona, sister to the Queen of France; so that he at once offended two royal houses and his powerful friend Warwick. Aided by France, Warwick, who had contracted his daughter to the Lancastrian Prince Edward, landed with Clarence and some other lords at Dartmouth; and quickly saw himself at the head of 60,000 men, with whom he marched to encounter Edward. The king left Warwick in full possession of his kingdom, 11 days after he had set his foot in it. Henry's title was again recognized by Parliament, and Warwick and Clarence were declared regents of the kingdom. Edward subsequently landed at Ravenspur, in Yorkshire. Here his forces were reinforced by partisans from all quarters, and he was soon enabled to march to London, where he obtained entrance as king, and the unfortunate Henry again became prisoner. Warwick advanced against him as far as Barnet, where, on 4 April 1471, another great battle was fought, which ended in the death of Warwick, and a decisive victory on the part of Edward. On the same day Queen Margaret and her son landed at Weymouth, and marched into Gloucestershire, where she was met by the victorious Edward, who totally defeated her at Tewkesbury. The queen and her son Edward being taken prisoners and brought into the presence of the victor, Edward asked the latter how he dared to invade his dominions. On receiving a spirited answer he basely struck the captive prince on the face with his gauntlet — the signal for immediate massacre by the king's brothers and other nobles attendant. Margaret was thrown into the Tower, where Henry VI. soon after died, but whether by violence or by disease is uncertain. The latter part of his reign was disturbed by his jealousy of his brother Clarence, whom he put to death, it is said, by drowning in a butt of Malmsey wine.

Edward V., king of England: b. Westminster 2 or 3 Nov. 1470; d. London 1483. He was the eldest son of Edward IV., and was in his thirteenth year when he succeeded his father in 1483. He fell into the hands of his uncle, the Duke of Gloucester, the regent who caused the young king and his brother to be sent to the Tower, and, it is said, had them smothered by ruffians. Two bodies, answering their description, being found buried at the foot of the stairs of their apartment, in the reign of Charles II., were taken up by that king's order, and deposited in Westminster Abbey.

Edward VI., king of England: b. Hampton Court, England, 12 Oct. 1537; d. Greenwich 6 July 1553. He was the son of Henry VIII. by

Jane Seymour. At his father's death he was only 10 years of age, and as he did not live to attain majority, the public acts of his reign are to be deemed those of his counselors. His education was entrusted to men of the first character for learning, among whom was Sir John Cheke. He was studious, somewhat retiring, devout, and showed a decided preference for the reformed doctrines, and antipathy to those of the Roman Catholic Church. After his father's death his maternal uncle, the Duke of Somerset, became protector, but his administration raised up such powerful enemies that he was brought to the scaffold with the king's consent (1552). After his death Dudley, Duke of Northumberland, became all-powerful, and through his influence Edward, in a declining state of health, was induced to set aside the succession of both his sisters, and to settle the crown upon Lady Jane Grey, claiming through his father's youngest sister, the Duchess of Suffolk.

Edward VII., king of Great Britain and Ireland, and Emperor of India: b. Buckingham Palace 9 Nov. 1841, and baptized as Albert Edward. He is the eldest son and the second child of the late Queen Victoria and the prince consort, Prince Albert of Saxe-Coburg. On 14 December in the year of his birth he was, as heir-apparent, created Prince of Wales. After receiving a careful education under private tutors he studied at the universities of Edinburgh, Oxford, and Cambridge. In the summer of 1860 he visited Canada, where he was enthusiastically received, and by special invitation of President Buchanan extended his visit to the United States, where his reception was no less cordial. He was appointed a brevet-colonel in the army in 1858, and three years later was attached to the Curragh Camp in Ireland. In October 1861, he was made a bencher of the Middle Temple. In 1862 he was promoted to the rank of general, and in the spring of that year he set out on a visit to Egypt, Palestine, Syria, and Athens in company with the Rev. Arthur Penrhyn Stanley, afterward Dean of Westminster. After the Prince's return from the East he was introduced at the privy council, in 1863 he took his seat in the House of Lords, and about the same time formally gave up his right to succeed to the Duchy of Saxe-Coburg-Gotha. On March 10, 1863, at St. George's Chapel, Windsor Castle, he was married to the Princess Alexandra, eldest daughter of the King of Denmark. From this time onward the Prince discharged many important public ceremonial functions in various parts of the United Kingdom. Near the end of 1871 he was attacked by typhoid fever, and for a time it seemed as if his death were imminent, but he had completely recovered early in 1872. On 27 February of that year his recovery was made the occasion of a special thanksgiving service in St. Paul's Cathedral. In October 1875 he sailed from Dover on his journey to India. He arrived at Bombay in November, and between that date and his departure for England in March 1876 he visited the chief provinces, states, and cities of the Indian Empire, being everywhere received with the utmost cordiality and respect. With the Princess he made an extended tour through Ireland in 1885, and in 1888 his silver wedding was celebrated. The establishment of the Im-

perial Institute as a memorial of the jubilee of the late queen (in 1887) was mainly due to his suggestion and exertions. In 1893 he sat on the Poor Law Commission, and in 1896 he was appointed chancellor of the newly created University of Wales. In the diamond jubilee year (1897) he established the Prince of Wales Hospital Fund for the better financial support of the London hospitals. At the great naval review of that year he represented Queen Victoria. By the death of his mother on 22 Jan. 1901, he became King of Great Britain and Ireland, and Emperor of India, and has elected to be known as Edward VII. On 14 February he and Queen Alexandra opened Parliament in state. To him and Queen Alexandra have been born: Albert Victor Christian Edward, Duke of Clarence and Avondale, b. 8 Jan. 1864, d. 14 Jan. 1892; George Frederick Ernest Albert, Duke of Cornwall and York, now heir-apparent, b. 3 June 1865, married 6 July 1893, to the Princess Victoria Mary of Teck; Princess Louise Victoria Alexandra Dagmar, b. 20 Feb. 1867, married 27 July 1889, to the Duke of Fife; Princess Victoria Alexandra Olga Mary, b. 6 July 1868; and Princess Maud Charlotte Mary Victoria, b. 26 Nov. 1869, married 22 July 1896, to Prince Charles, second son of the Crown Prince of Denmark.

Elaborate national and international preparations for the coronation ceremonies in Westminster Abbey were made for 26 June 1902; but on 24 June all festivities and ceremonies were suspended in consequence of a sudden illness requiring an immediate surgical operation. Owing to his fine natural constitution, the king fully recovered, and the coronation in a greatly modified form was accomplished 9 August. See 'The Private Life of King Edward VII.' (1901); 'Life of the King' by "One of His Majesty's Servants" (1901); 'From Cradle to Crown' (1902).

Edward, Prince of Wales, surnamed the Black Prince, English prince: b. Woodstock 15 June 1330; d. Westminster 8 June 1376. He was the eldest son of Edward III. and Philippa of Hainault, and at the age of 15 accompanied his father in his invasion of France, and received from him the honor of knighthood. The victory of Crécy, 26 Aug. 1346, which King Edward left principally to the exertions of the force under his son's command, to use that warlike king's language, "showed that he merited his spurs." It was on this occasion that he assumed the motto of *Ich dien* (I serve), used by all succeeding princes of Wales, and derived, it is said, from the crest of the King of Bohemia, slain in that battle, which tradition, however, later antiquaries seem disposed to discredit. In 1355 he commanded the army which invaded France from Gascony, and the next year fought the great battle of Poitiers, and distinguished himself by the courtesy with which he treated his prisoner, King John. By the Peace of Bretigny his father had obtained the provinces of Poitou, Saintonge, Périgord, Limousin, etc., which he annexed to Guienne and formed into a sovereignty for his son, under the title of the Principality of Aquitaine. There the prince took up his residence; and at his court Pedro the Cruel sought refuge, when driven from his throne by his natural brother, Henry of Trastamare. Edward undertook the re-establishment of this

tyrant, which he accomplished. Disappointed, by the perfidy of Pedro, of the stipulated reimbursements, the taxes he was obliged to levy on his new subjects rendered his government unpopular; and an appeal was made to the king of France, as his liege lord, who summoned him as his vassal to appear at Paris. "I will come," replied the angry prince, "but it shall be at the head of 60,000 men." His health, however, was too far declined to enable him to take the field, when the king of France invaded his dominions; and having suffered the mortification of seeing his generals defeated, he withdrew into England, and after lingering some time died in his 46th year, leaving an only son, afterward Richard II. He was buried in Canterbury Cathedral, where portions of his armor are still suspended above his tomb.

Edward, Thomas, Scottish naturalist: b. Gosport 1814; d. 27 April 1886. As the apprentice of a shoemaker he spent the early part of his life in Aberdeen, and in 1837 married and settled in Banff. Here he struggled for 40 years in a ceaseless effort to acquire a close knowledge of natural history, while at the same time he supported his wife and 11 children on wages that never exceeded 15 shillings a week. Apart from his laborious work as a shoemaker he collected, described, and exhibited numerous specimens of natural history. A biography of Edward, written by Samuel Smiles (q.v.), appeared in 1876, 'Life of a Scotch Naturalist,' and being thus prominently brought before the public, a pension of £50 a year was conferred upon him by the Queen.

Edwards, Alfred Shenstone, Socialist propagandist: b. Birmingham, England, 23 Oct. 1849. Since 1867 he has resided in the United States and has been an active worker in labor and social reform organizations since 1887. He edited 'The Coming Nation' (1895-8), and later 'The Social Democratic Herald,' and has written extensively under the pen-name "Seven-oaks."

Edwards, Amelia Blandford, English Egyptologist and novelist: b. London 1831; d. Weston-super-Mare, Somerset, 15 April 1892. Her novels include: 'My Brother's Wife' (1855); 'Hand and Glove' (1859); 'Half a Million of Money' (1865); 'Lord Brackenbury' (1880); 'Barbara's History,' and 'In the Days of My Youth' (1873). Later she achieved great celebrity through her writings and lectures in Europe and the United States on the antiquities of Egypt; her best-known works in this field are: 'A Thousand Miles Up the Nile' (1877); and 'Pharaohs, Fellahs, and Explorers' (1891). She also translated Maspero's work on 'Egyptian Archaeology,' and was secretary of the Egyptian Exploration Fund.

Edwards, Bela Bates, American Congregational clergyman: b. Southampton, Mass., 4 July 1802; d. Athens, Ga., 20 April 1852. He was graduated at Amherst College in 1824, was appointed tutor there in 1826, and was assistant secretary of the American Education Society, 1828-33. He edited the 'American Quarterly Register' 1828-42; founded the 'American Quarterly Observer' in 1833, and edited it after consolidation with the 'Biblical Repository' in 1835-8; edited the 'Bibliotheca Sacra' (1844-52). In 1837 he became professor of Hebrew at

EDWARD VII,
KING OF ENGLAND.

EDWARDS

Andover Theological Seminary, and in 1848 professor of biblical literature there, which posts he held till his death.

Edwards, Mrs. Bennett, English novelist. She has published 'A Tantalus Cup'; 'In Sheep's Clothing'; 'Pharisees'; 'The Unwritten Law'; 'Saint Monica'; 'His Story and Hers'; 'A Woman in Spectacles.'

Edwards, Bryan, English historian of the West Indies: b. Westbury, Wiltshire, 21 May 1743; d. Southampton 15 July 1800. On the death of his father he was taken under the care of an uncle in Jamaica, who left him a large fortune. After a successful mercantile career he returned to England, and in 1796 took his seat for the borough of Grampound, which he represented until his death. He is remembered for his 'History, Civil and Commercial, of the British Colonies in the West Indies' (1793). A new edition of this work (1801) includes a history of San Domingo. He also published 'Proceedings of the Governor and Assembly of Jamaica in regard to the Maroon Negroes' (1796).

Edwards, Charles Lincoln, American scientist: b. Oquawka, Ill., 8 Dec. 1863. He was graduated at Lombard University in 1884; Indiana University, 1886; and the University of Leipsic 1890. He was assistant professor of biology in Clark University 1892-3; associate professor of biology in the University of Texas, 1893-4; professor of biology in the University of Cincinnati 1894-1900; and professor of natural history in Trinity College after 1900. He was president of the American Folk-Lore Society in 1899. He has published 'Bahama Songs and Stories' (1895), and many papers and monographs on subjects in biology, embryology, folk-lore, etc.

Edwards, Clarence Ransom, American military officer: b. Cleveland, Ohio, 1 Jan. 1860. He was graduated at West Point in 1883; professor of military science and tactics at St. John's College, Fordham, 1890-3. Commissioned first lieutenant, 1891; captain, 1898; lieutenant-colonel of volunteers, 1899. Served on the staff of Gen. Lawton in the Philippines, and was recommended for brevets of major, lieutenant-colonel, and colonel in the regular establishment, and brigadier-general of volunteers. Accompanied Gen. Lawton's body to the United States. Chief of the division of insular affairs, War Department, 1900-2. Commissioned colonel, 1 July 1902, and chief of the bureau of insular affairs since that time and director of its publications.

Edwards, Edward, English librarian: b. London 1812; d. Niton, Isle of Wight, 10 Feb. 1886. He published 'Memoirs of Libraries' (1859); 'Lives of the Founders of the British Museum' (1870); 'Sir Walter Raleigh' (1885).

Edwards, Elisha Jay, American journalist: b. Norwich, Conn., 10 Nov. 1847. He was graduated at Yale in 1870, and at Yale Law School in 1873, and has been in newspaper work since 1870. He was Washington correspondent of the *New York Sun*, 1880-4, and editor of the *New York Evening Sun* 1887-9. Since 1889 he has contributed the daily "Holland" letters to several papers in the larger cities. In 1894 his charges against the sugar trust called forth an investigation by the United States Senate

and the prosecution of the president of the sugar trust and others. He contributed a series of political biographies to 'McClure's Magazine' in 1893-4, and has published other magazine articles.

Edwards, George, English sociologist: b. 1752; d. London 17 Feb. 1823. Possessed of the conviction that he held the precious secret of the relief to man's estate, he wrote some 50 books to disseminate the information, among which is one with the long title: 'The Practical System of Human Economy, or the New Era at Length Fully Ascertained, Whereby We are Able in One Immediate Simple Undertaking to Remove the Distress, Burdens, and Grievances of the Times, and to Bring All our Interests, Public, Private, and Commercial, to their Intended Perfection' (1816).

Edwards, George Wharton, American artist and author: b. Fairhaven, Conn., 1859. He was educated in Antwerp and Paris, and has received many medals and honors for his work at American and European exhibitions. His watercolors are particularly praiseworthy and his magazine illustration is well-known and of a high quality. He has published 'Thumbnail Sketches' (1886); 'P'tit Matin and Other Monotones' (1887); 'The Rivalries of Long and Short Codiac' (1888); 'Break o' Day, and Other Stories' (1889); he has illustrated Oliver Wendell Holmes' 'Last Leaf' (1885); Austin Dobson's 'Sun Dial' (1892); Spenser's 'Epithalamion' (1895); 'Old English Love-Songs' (1896); 'Old English Ballads' (1897).

Edwards, Harry Stillwell, American journalist and novelist: b. Macon, Ga., 23 April 1854. He was graduated from the law department of Mercer University, and practised law, but in 1871 entered journalism in his native city. He is well-known as a writer of dialect stories. Among his works are: 'Two Runaways, and Other Stories' (1889); 'Sons and Fathers'; 'The Marbeau Cousins'; 'His Defense, and Other Stories.'

Edwards, Henri Milne. See MILNE-EDWARDS.

Edwards, Henry Sutherland, English author: b. London 1828. He traveled and studied in Russia, Turkey, and central Europe, acting as newspaper correspondent. He has written 'The Polish Captivity' (1863); 'Life of Rossini' (1869); 'The Germans in France' (1874); 'The Slavonian Provinces of Turkey' (1876); 'The Prima Donna: Her History and Surroundings from the 17th to the 19th Century' (1888); 'Dutiful Daughters' (1890), a tale of London life; 'Personal Recollections' (1900).

Edwards, James Thomas, American educator: b. Barnegat, N. J., 6 Jan. 1838. He was graduated at Wesleyan University in 1860. He served in the national army in the Civil War, was afterward principal of several schools, and in 1892-3 was field-secretary of the Chautauqua System of Education. He was a senator in the Rhode Island legislature, 1865-9, and a member of the New York legislature, 1892-3; was chairman of the committee on education of both bodies, and was the author of the University bill and Library and Traveling Library bills. He was a trustee and director of the departments of physics and chemistry of the

Chautauqua summer schools 1883-93, and has been prominently identified with other educational movements. He has published 'The Grass Family' (1872); 'The Silva of Chautauqua Lake' (1892); 'Addresses—Educational, Political, Scientific, Religious' (1896); 'Pen and Picture' (1896); 'Rhymes from a Reclining Chair' (1902); and has contributed articles to various periodicals.

Edwards, John, American poet: b. near the river Twrch, Wales (whence known as Eos-Glan-Twrch, or "the nightingale of the Twrch"), 15 April 1806; d. near Rome, N. Y., 20 Jan. 1887. He did much to promote the publication in America of Welsh periodicals. His published poems include 'The Crucifixion' (1853) and 'The Omnipresence of God' (1859).

Edwards, Jonathan, American theologian: b. in South (then East) Windsor, Conn., 5 Oct. 1703, a year before the death of Locke, his first great inspiration in philosophy, and about two years before the birth of Franklin, with whom he shares the distinction of supreme intellectual eminence among his American contemporaries; d. Princeton, N. J., 22 March 1758. His father, the Rev. Timothy Edwards, a graduate of Harvard, was parish minister at Windsor for nearly 60 years. His mother, Esther Stoddard, a daughter of the Rev. Solomon Stoddard, minister in Northampton, Mass., is celebrated for force of character and native vigor of intelligence. There were ten other children in the family, all girls. Jonathan, the fifth child, was brought up with his sisters in an environment peculiarly adapted to his development. The quiet beauty of the landscape about Windsor and the outward simplicity of the life in the village and the home, where the interests of recognized supremacy were those of the spirit and the mind, exerted congenial influence on a character preëminently disposed to reflection and to the feeling and practical acknowledgment of things invisible. Religion, both in its experimental and in its theoretical aspects, early became his absorbing preoccupation. The precocity of his intellectual development is shown in his first essays, a metaphysical tract on the nature of the soul, written when he was ten, and a paper, remarkable for accuracy of observation and acuteness and breadth of reasoning, on the habits of the "flying spider," written some two years later. At thirteen he entered the Collegiate School at Saybrook, afterwards Yale College, from which he graduated at New Haven, with the valedictory in a class of ten, shortly before his seventeenth birthday (1720). The event of greatest intellectual significance for Edwards, and one which may even be said to mark a turning-point in the history of philosophy in America, was his reading, in his sophomore year in college, of Locke's 'Essay on the Human Understanding.' The book made on him a profound impression. He read it, he tells us, with a pleasure far higher than that of the greediest miser gathering up handfuls of silver and gold from some newly discovered treasure. He began now, or shortly afterwards, a series of notes designed as material for an exhaustive treatise on the mind. He also wrote a series of notes with a view to a corresponding treatise on natural science. These notes, some of which prob-

ably belong to the years immediately following his graduation, though some of the most important almost certainly go back to an earlier date, throw a flood of light on the whole subsequent development of his thinking, as well as on the character and workings of his mind at the period of their composition. The notes on natural science, indeed, valuable as they are as evidence of his genius, express in their main contents only an incident in his thinking. But the psychology and philosophy of both series of notes, especially the notes on the mind, are intimately connected with his theological interests. Here the influence of Locke is marked, but more striking still the originality of the writer's response to it. Edwards accepts Locke's empiricism only in part. He makes all our ideas "begin from" sensation; he recognizes distinctly the fundamental importance of the mechanism of association and the part played by "images" in the higher intellectual processes. But he is very far from regarding mind as constituted of passively received impressions and their copies. He emphasizes rather the intellectualistic elements in Locke's doctrine; his tendency is towards Kant rather than towards Hume. The mind is, in his view, essentially active, in pleasure and pain, in sentiment and emotion, as well as in judgment and choice. In its intellectual constructions, moreover, the mind is guided by intuitively certain principles (being, cause, finality, etc.) and is capable, by reflection, of rising above all things sensible to the contemplation of things spiritual and eternal. Universals are not all of pragmatic origin and merely nominal import; the most considerable species have their foundation in "the order of the world." The most noteworthy metaphysical advance beyond Locke lies in the idealistic theory of matter. The general conception was not new; already in the 18th century, before the earliest of these notes were written, Norris, Collier, and Berkeley had propounded similar views. Edwards may have heard of their writings, but it is doubtful if he had read any, and practically certain that he had not then read Berkeley. However suggested, the doctrine is worked out in a thoroughly independent fashion and the expression of it is wholly original; the true substance of the material universe is declared to be God and its *esse*, not *percipi*, but an "infinitely exact and precise divine Idea, together with an answerable, perfectly exact and stable Will, with respect to correspondent communications to created minds, and effects on their minds." In a later note in his diary he desires as clear a conception of the relation to God of finite minds. In one of the notes on the mind, he rejects Locke's notion that personal identity consists in identity of consciousness. The whole trend of his metaphysics pointed to another solution. With him the fundamental ontological verity is "that God and Real Existence are the same," "that God is," and that "there is none else." Created spirits are "emanations" or "communications" of his Being. What other conception then for him is possible, but that they, too, like material things, consist in God's distinguishing Thought and stable Will?

Edwards seems to have had no occasion to refer in his later writings to the idealistic theory of matter so pronounced in these notes of his

youth. But there is no reason for thinking that he abandoned a view so congruous with his general philosophical position. Other of his most distinctive teachings are here already expressed or indicated. Here, for example, is the doctrine that the will, which is regarded as identical with inclination so far as the latter has respect to the mind's immediate actions, is always determined by motives inherent in the mind's apprehension of the greatest apparent good. Here, too, are the doctrines that "excellency" consists in "the consent of being to being"; that virtue, or the excellency of minds, consists in "love to being"; that the type of this excellency is God's mutual love of himself in the eternal process of the Trinity; that God's love to himself "includes in it, or rather is the same as, a love to everything, as they are all communications of himself"; and that, since God is "universal Being," true virtue in finite minds consists in love to him. These are the positions elaborated in the treatises on the 'Will' and on the 'Nature of True Virtue' and in the recently (1903) published essay on the 'Trinity.' And the most speculative of Edwards' works, the treatise on 'God's End in Creation,' is essentially but an application to a special problem of the conceptions here advanced concerning the nature of God as "universal Being" and as "Love," of finite spirits as "emanations," "communications" or "creations" in his likeness, and of the sensible world as in its order and harmony, a "shadow" of his excellency.

After graduating, Edwards remained two years in New Haven studying for the ministry. He then preached for several months to a small Presbyterian church in New York. But he again returned to New Haven, took his master's degree, and for two years (1724-6) was tutor in the college. He had declined several invitations to a settlement in the ministry, and seemed definitely committed to the academic career, for which by training and intellectual gifts he was eminently qualified, when the call came to him from the church in Northampton, Mass., to become the colleague of the venerable Solomon Stoddard, his grandfather. He was installed at Northampton, 15 Feb. 1727. A few months later he married Sarah Pierrepont, of New Haven, then seventeen, of whom four years before he had written an admiring description, celebrated as one of the most perfect and charming of its kind in literature.

The moral and religious development of Edwards up to this period was as remarkable for richness of experience and intensity of spiritual energy as was his intellectual development for originality, acuteness and speculative power. In a "narrative of personal experience," written for his own use, we have the intimate record of his religious life from its early beginnings, when as a boy he built with other boys a booth in a swamp for daily prayer and had other places for his own devotions besides, through its decline and revival—his "conversion," it has been called, though, as he notes with some misgiving in his diary, he was never converted in the manner traditionally expected—to its culmination in a state of settled conviction, with great inward delight in the truth and beauty of the objects of religious faith, including at times marked exaltation of sentiment and something

akin to ecstasy. His diary, in which, after the fashion of the time, he watches, with almost morbid intensity, the daily fluctuations of his spiritual estate, tells the same story for a part of the period. And in his seventy 'Resolutions' we have a most striking expression of the lofty moral purposes of his life and of the ideas which actually governed it. For example: "To live with all my might while I do live"; "when I think of any theorem in divinity to be solved, immediately to do what I can towards solving it, if circumstances do not hinder"; "never, henceforward, till I die, to act as if I were any way my own, but entirely and altogether God's"; "on the supposition that there never was to be but one individual in the world, at any one time, who was properly a complete Christian, in all respects of a right stamp, having Christianity always shining in its true lustre, and appearing excellent and lovely, from whatever part and under whatever character viewed: resolved, to act just as I would do, if I strove with all my might to be that one, who should live in my time." It is the combination of this rare emotional susceptibility, this high reverence and moral enthusiasm, this strict, unrelaxing conscientiousness, with extraordinary subtlety and perspicacity of intellect and an unrivaled capacity for logical analysis and abstract reasoning that gives to Edwards his distinction and is the secret of his power.

On the death of Mr. Stoddard in 1729, Edwards, then 25, became sole pastor of the church in Northampton, which was reputed the largest and wealthiest in the colony outside of Boston. In 1731 he preached in the "public lecture" in Boston the sermon, "God Glorified in Man's Dependence," with which he achieved a notable success. The sermon is an eloquent and impressive proclamation of one of the most fundamental articles of his creed, the doctrine of God's "absolute sovereignty" in the work of salvation: it was a prophet's call to the Puritan churches to return to the old high Calvinistic faith. The counterpart to it is the sermon, published in 1734, on the 'Reality of Spiritual Light,' which proclaims the mystical principle of a supernatural illumination directly imparted and experienced. The emphasis on religious experience becomes still more pronounced in the two great revivals with which the fame of Edwards as a preacher is especially associated. He wrote the story of the earlier revival, that of 1735 in Northampton, in his 'Narrative of Surprising Conversions' (1736), with confident, even exultant, assurance; the excesses of the "Great Awakening" of 1740-2, more extensive and tumultuous, led him to reflect on the difference between a genuine and a false experience ('Distinguishing Marks of a Work of the Spirit of God,' 1741), and then to an apologetic defense of the movement against the objections of its opponents ('Thoughts on the Revival,' 1742). It was in the height of the excitement that he preached in Enfield, Conn., his sermon on 'Sinners in the Hands of an Angry God' (1741), the extreme representative of a type not uncommon with him, indeed, yet not the most common nor the most representative even in his revival preaching (see, for example, the sermons, 'Justification by Faith,' etc., 1738). More noteworthy and far more original was the

treatise on the 'Religious Affections' (1746), in which the distinctively new note in Edwards, the new emphasis on subjective experience, receives its fullest systematic expression.

In the reaction which followed the revival, a case of discipline arose in his parish—many of the young people being charged with reading and circulating immoral books—the unfortunate management of which caused strong resentment and permanently undermined his influence. This was in 1744. Four years later, on his attempt to set aside the established custom—an extension of the old "Half-way Covenant" of which Mr. Stoddard had been the chief advocate—and require for full communion a credible profession of godliness, the disaffection became a bitter and determined opposition. The controversy ended finally in his dismissal, 22 June 1750, after a ministry of twenty-three years, perhaps the most laborious and distinguished in the annals of the American churches. His 'Farewell Sermon,' the greatest of his discourses, is a noble expression of his character and the dignified "apologia" of his ministerial life. Early in the following year he removed with his family to Stockbridge, Mass., then a settlement on the frontier, to do the double work of pastor of the village church and missionary to the Indians. It was while thus engaged that he wrote, during the seven years of his residence in Stockbridge, the theological treatises and essays which are the solid foundations of his fame. In the autumn of 1727 he accepted, with some misgivings, a call to the presidency of the college in Princeton, N. J., made vacant by the death of his son-in-law, the elder Aaron Burr. He had scarcely entered on the duties of this office when he fell a victim of inoculation for smallpox, 22 March 1758.

The least episodal of thinkers, Edwards wrote no system of philosophy or body of divinity. The connected scheme of his ideas has to be gathered from the large proportions of his various writings on special topics, mainly controversial. The professed aim of the major part of these writings is to defend the distinctive doctrines of Calvinism against the rising tide of Arminianism in the churches inheriting the Calvinistic tradition. He brought to this task a power of keen and relentless dialectic that left no loophole of escape to one who accepted his premises and that fairly wearied and overwhelmed the opponent with the multitudinous array of the argument. He brought also, what more contributed to the originality of his thought, the spirit and profound insights of the speculative philosopher, seeking to ground his theology in metaphysics. Finally, he brought the solid character and the rich religious experience which gave the system for him perpetual practical verification and which certainly, with his moral enthusiasm and vivid imagination, gave it, in his hands, much of its vitality. The central conception about which all his thinking moves is the conception of the absolute sovereignty of God. Metaphysically, God is the sole Reality. Neither Parmenides in ancient, nor Spinoza in modern philosophy, is more emphatic in the assertion of the One Absolute Reality than Edwards. He, however, does not stop here. God, the Absolute Reality, is with him—it is easy to see that the tradition here

blends with his metaphysics—spiritual, personal—tripersonal—and supremely excellent. In his 'Essay on the Trinity' (1903) he develops the doctrine that the Father is the Deity in prime subsistence, the Son the Deity subsisting in the act of God's Knowledge of himself, and the Holy Ghost the Deity subsisting in the act of God's infinite Love and delight in himself. This Love of God, which is thus his consummating, essential Excellency, is primarily the love of complacency in the perfection of his Being; but it may be viewed also as benevolent, so far, namely, as it embraces the complete content of the divine Idea in God's Knowledge of himself, and so far as that Idea includes within itself the creative plan of the world and the evolution of its history. Now it is the profound thought of Edwards' dissertation on the 'End for Which God Created the World' (written 1755), the most speculatively philosophical treatise of the 18th century, that such is, in truth, the fact. God finds in himself a *disposition* to produce an emanation from himself in which to reflect his glory and express outwardly his delight in his own excellency. The final end of creation is, therefore, the manifestation of the divine glory in a perfect spiritual society. In his 'History of Redemption,' Edwards endeavors with, to be sure, very inadequate knowledge and, for us, impossible dogmatic assumptions, but with a genuine philosophical purpose, to trace the process through which this end is realized in time. The "emanation," or passage into time, of the eternal world-plan, he represents, in his essay on 'Decrees and Election,' as an act of divine Will, the preservation of the world being a perpetual and continued creation. Beyond this indication of a nexus in the divine Will between the world-plan in idea and in process of realization, Edwards does not go; he develops no theory of the metaphysical relation of the temporal and eternal. He is very clear, however, in teaching that the divine Decree conforms to, indeed is determined by the divine Wisdom—what must evidently be taken into account in interpreting the many passages in his writings in which he speaks of God's "arbitrary" Will and of his "mere good pleasure." Edwards' early idealism with respect to matter is in thorough agreement with this doctrine of creation, but is not now in question. His whole concern now is with the divine plan relative to man. The problem of supreme interest here, of course, is the problem of moral evil. No one has depicted the nature, extent and consequences of sin in stronger language than Edwards. Sin is with him literally a guilty disposition inherent since the Fall in man's very constitution, as that even infants, that seem innocent to us, "are in God's sight young vipers," so that the whole race merits and, in the absence of "special" grace, which is bestowed only on the definite number of the elect, inevitably tends to horrible and everlasting destruction. Notwithstanding that all this is held to be included in the creative plan, Edwards nevertheless strongly insists on the sinner's responsibility. In his treatise on 'Original Sin' (1758), he brushes aside the legal fictions with which that doctrine was commonly invested, and boldly advances to the Augustinian position that the whole race was really present and really participated in Adam's transgression—a notion

which involves him in curious and intricate speculations concerning personal identity. The most celebrated of his writings, the treatise on 'Freedom of the Will' (1754), discusses from other points of view the same general problem of the relation of the creative Decree to the moral life of man. His object in this work was to refute the notion that the will in choosing is so undetermined with respect to its motives as to be able to initiate acts really contingent and, therefore, incapable of being included in God's determinate foreknowledge and decree. He does not deny the fact of choice: "faculty of choice," indeed, in his definition of will. But he contends that this faculty is always determined in its preferences by the strongest motive, "is always as the greatest good is." The connection of such motive and choice is necessary. But the necessity of this connection is quite consistent, in his view, with the liberty to do as one pleases, without hindrance or impediment. He modifies, indeed, the usual Calvinistic doctrine, declaring in one of his letters that man now, even after the Fall, has all the liberty that he ever had. His chief attack is against the notion that will is self-determined, that is, that it determines itself to will, a notion which, thus stated, leads, as he shows, to the infinite regress. But there is nothing in his contention to preclude the idea that it is the whole concrete nature of a self which determines the act of choice. His whole argument, in fact, is based on the thorough-going application of the law of sufficient reason. Each act of will has its reason, or, as Edwards, suggesting a naturalistic interpretation not intended, says, its "cause," from which it follows with "logical" or "moral" necessity. God's Will even is no exception. Human responsibility for sin is not dependent on the way the volition is motivated, but on the evil nature of the disposition. The *ultimate* ground or reason of all volition is the divine Idea, comprehending the world-plan, within which every finite being has his place, and the realization of which is the effect of the divine decree. God is thus, in a sense, the author of sin, yet not so, as in the case of the human will, that his Will is evil, but so that he, being sovereignly good and perfect, and creating the world for a supremely good end, permissively decreed the evil foreseen as comprehended in this purpose.

Thus Edwards, absolutist in metaphysics, ever comes back in his theology to the conception of God as sovereign Power, Wisdom and Love, whose "decrees," determining that the world-plan shall be realized, are the foundation of an all-inclusive optimism. Had he developed his thought as a pure philosopher, his system would doubtless have assumed a very different character in details and in some of its main conclusions. As it was, he blended his philosophy with his theology and his theology with his philosophy and both with a conception and interpretation of scripture that modern criticism regards as untenable. And although the sharp antitheses in which his system abounds are all reconciled in his thought of God's goodness and eternal decrees, as he lacked the mediating conceptions with which some more modern doctrines have made us familiar, this reconciliation is apt to appear to us as one of faith rather than of reason. These defects, however, will not

blind the sympathetic student of opinion to the essential strength and largeness of his general scheme of thought. His historical influence extended mainly in two directions. On the one hand, the speculative and logical power with which he worked out his fundamental conception made him the chief of a school of theologians in New England—Hopkins, Emmons, the younger Edwards, Dwight, etc.—who, with less logical acumen and less speculative ability, sought to carry out his principles, and particularly to so formulate the Calvinistic system as to make it appear better accordant with popular notions of the goodness of God and human responsibility. On the other hand, by his doctrine of "spiritual light" and by the emphasis he put on conversion and the religious affections, he powerfully furthered the movement which, laying special stress on religious experience, tends to discard dogmatic assumptions altogether and to seek the solution of the religious problem in the consciousness of this experience itself.

Bibliography.—The first American edition of Edwards' 'Works' was published at Worcester in 8 vols. (1809). Dr. S. E. Dwight published an edition with much new matter and a memoir in 10 vols. (1829-30). Other editions are mainly reprints. There is one in 2 vols. (London 1840), another in 4 vols. (New York 1858), another in 1 vol. (the Bohn edition, London 1865). Many of the Edwards' manuscripts have never been published, and a new and definitive edition of his 'Works' is a desideratum. The 'Observations Concerning the Scripture Economy of the Trinity,' edited by E. C. Smyth (1880), and the 'Essay on the Trinity,' edited, with an introduction on Edwards' theology, by G. P. Fisher (1903), are not included in the published editions. Dwight's 'Memoir' is the fullest for the biography; A. V. G. Allen's 'Jonathan Edwards' (Boston 1889) is the most valuable single work on the theologian from a modern point of view.

HARRY NORMAN GARDNER,

Professor of Philosophy, Smith College.

Edwards, Jonathan (the younger), American theologian: b. Northampton, Mass., 26 May 1745; d. Schenectady, N. Y., 1 Aug. 1801. At the age of six years he went with the family of his parents to Stockbridge, where there was but one school, and that common to the children of both the Indians and white inhabitants, of the latter of whom there were so few that he was in danger of forgetting the English tongue. He so thoroughly learned the language of the Stockbridge Indians, that, as he tells us, all his thoughts ran in their dialect. This knowledge of their language he retained through life. In 1761 he entered the college at Princeton, N. J., where he was graduated in 1765. After leaving college he studied divinity, and in 1776 was licensed as a preacher of the gospel. In 1769 he was ordained as pastor of the church in White Haven, in the town of New Haven, Conn., where he continued till May 1795. Resigning this charge, mainly on account of difference in doctrinal views between himself and some of his people, he was settled in 1796 as pastor of the church in Colebrook 1796-9, where, in addition to professional duties, his time was devoted to his favorite studies, and to an extensive correspondence which he had long carried on with learned men both in this country and in Europe. In May 1799 he became president of Union Col-

lege, Schenectady, which office he filled at the time of his death. He was the author of a treatise on 'Liberty and Necessity' (1797); and 'Discourses on the Atonement' (1785). See life by Tryon Edwards.

Edwards, Julian, American composer: b. Manchester, England, 17 Dec. 1855. His opera, 'Victorian,' its libretto adapted from Longfellow's 'Spanish Student,' was produced in London in 1884. Since coming to New York in 1888 he has composed the operas: 'Jupiter' (1892); 'Friend Fritz' (1893); 'King René's Daughter' (1893); 'Madeline' (1894); 'Brian Boru' (1896); 'The Wedding Day' (1897), and various other music.

Edwards, Justin, D.D., American Congregational clergyman: b. Westhampton, Mass., 25 April 1787; d. Virginia Springs 23 July 1853. He was graduated at Williams College in 1810, settled in the ministry at Andover in 1812, removed thence to the Salem Street Church, Boston, in 1828, and in 1829 resigned this charge to become secretary of the American Temperance Society, in the service of which he was engaged for seven years. After this, he was for six years president of the Andover Theological Seminary. He was the author of several tracts on moral and religious subjects, some of which had a wide circulation. Of his 'Temperance Manual,' some 20,000, and of the different parts of his 'Sabbath Manual,' nearly 2,000,000 copies have been published.

Edwards, Matilda Barbara Betham. See BETHAM-EDWARDS, MATILDA.

Edwards, Ninian, American political leader: b. Montgomery County, Md., March 1775; d. Belleville, Ill., 20 July 1833. He was graduated at Dickinson College; moved to the Green River district, Ky., studied law and was admitted to the bar in Kentucky and in Tennessee. He rose rapidly in his profession, was judge of the general court of Kentucky, of the circuit court and of the court of appeals, and chief justice of the State supreme court. In 1809 he was appointed governor of the newly organized territory of Illinois, and held that office till Illinois was admitted as a State. During his administration he organized companies of volunteer rangers and built a line of stockade forts which were of special value in the border wars with the Indians and in the War of 1812. In 1816 he was one of three commissioners appointed to treat with the Indian tribes. In 1818 he was elected to the United States Senate from Illinois and served six years; and in 1826 he was elected governor of the State, holding that office till 1830. Consult Edwards, 'History of Illinois and Life of Ninian Edwards' (1870).

Edwards, Osman, English lecturer and dramatic critic: b. Liverpool 18 Feb. 1864. He has published 'Short Studies of Theatrical Life' from the French of Daudet (1892); 'A Gauntlet' from the Norwegian of Björnson (1894); 'Residential Rhymes' (1899); 'Japanese Plays and Playfellows' (1901).

Edwards, Richard, English dramatist: b. Somersetshire 1523; d. 31 Oct. 1566. He was educated at Oxford, where he obtained distinction for scholarship, and became under Elizabeth one of the gentlemen of the queen's chapel,

and had charge with others of the theatrical representations before the children there. His 'Damon and Pythias' was the first English tragedy on a classical subject, and was acted before the queen at Oxford in 1566. Though esteemed among the best writers of interludes and rude comedies of the time, all his other dramas are lost. He wrote several minor poems, one of which, entitled 'Amantium Iræ,' has been often reprinted in modern collections.

Edwards, William, American inventor: b. Elizabeth, N. J., 11 Nov. 1770; d. Brooklyn, N. Y., 1 Dec. 1851. After receiving a common school education he learned the tanning trade, and built his own tannery at Northampton, Mass., but eventually settled in Hunter, Greene County, N. Y. Here he opened a model tannery, with improvements in manufacturing appliances originated by himself. His principal invention was a leather-rolling machine, which saved the labor of hammering. He invented other machines, and utilized water-power to such an extent as practically to revolutionize the tanning business in the United States, improve the quality of shoe-leather and cheapen its cost.

Edwards, William Henry, American naturalist: b. Hunter, Greene County, N. Y., 15 March 1822. He was graduated at Williams College 1842, and was admitted to the bar 1847. In 1846 he traveled in South America, going up the Amazon River and making a natural history collection. He has published: 'Voyage up the Amazon' (1847); 'The Butterflies of North America' (1879, 1884 and 1897); 'Shaksper, not Shakespeare' (1900); and contributed over 150 papers on Lepidoptera to the 'Canadian Entomologist.'

Edwardsville, Ill., city, county-seat of Madison County; on the Illinois Terminal, the T., St. L. & K. C., and the Wabash R.R.'s, about 70 miles southwest of Springfield, and 20 miles northeast of Saint Louis, Mo. It is the centre of a coal mining and agricultural region. The industries are such as are adapted to the country, including several plants for the manufacture of tools and other hardware. Pop. 4,212.

Edwin, king of Northumbria: b. about 585; d. 633. He was the son of Ella, who seems to have ruled that kingdom from 559 to 589. Being an infant at his father's death the crown was seized by Ethelfrith of Bernicia. The young prince was sent for protection to the court of Redwald, king of East Anglia, by whose aid he was eventually put upon the throne (617). He married Ethelburga, daughter of Ethelbert of Kent, and by her influence and that of Paulinus, a Roman missionary, whom she had brought from her father's court, was led to embrace Christianity, and make it the religion of his people. He was baptized in 627 at York, where he built the first church of wood. The Mercians, under Penda, revolted against the supremacy claimed by the Northumbrians; and the war which ensued was closed by a battle at Heathfield, or Hatfield, in Yorkshire, in which Edwin was defeated and slain.

Edwin Drood. See MYSTERY OF EDWIN DROOD.

Edwy, king of England: b. about 938; d. 958. He was son of Edmund I., and succeeded his uncle Edred in 955. Taking part with the

EECKHOUT — EEL-GRASS

secular clergy against the monks, he incurred the confirmed enmity of the latter. Having called Dunstan to account for his share in the administration in the preceding reign, the latter refused to attend the summons, and was in consequence banished. His party was, however, so strong that a rebellion was excited, and Edwy driven from the throne, to make way for his brother Edgar.

Eeckhout, ɛk'hout, or **Eckhout**, **Gerbrand van den**, Dutch painter: b. Amsterdam 19 Aug. 1621; d. there 22 July 1674. He was one of the pupils of Rembrandt, and in some measure successful in imitating his manner, especially in the early part of his life. He excelled chiefly in painting portraits, and these as well as his historical pictures abound in the best collections of Holland, while several of them are to be found in Germany. His most esteemed work represents Christ among the doctors.

Eecloo, ă-klō', Belgium, town in province of East Flanders, 11 miles northwest from Ghent, near the Liève. The manufactures are chiefly woolens, cottons, hats, tobacco, chocolate, soap, and starch; and it has breweries, distilleries, salt-refineries, dye-works, and oil-mills; and an active trade in grain, linen, cattle, and timber. Pop. 13,200.

Eekhoud, ɛk'hout, **Georges**, Belgian novelist and poet: b. Antwerp 27 May 1854. He first published two volumes of poetry, 'Myrtles and Cyresses' (1876); and 'Poetic Zig-Zags' (1877); then became a newspaper literary critic in Brussels, and wrote several short stories. His first considerable novel, 'The Militia of St. Francis' (1886), is a masterly portrayal of Flemish peasant life, especially its naïve mystic religiousness. His masterpiece, 'New Carthage' (1888), paints Antwerp life in its naked actuality. Still other works of his are: 'The Fusillades at Mechlin' (1890), a story of the peasants' uprising against the French in 1798; and 'La faneuse d'amour' (1900). In poetry he has developed from romanticism to pronounced realism.

Eel, the general name given to a variety of teleostomous fishes of diverse structure and resembling one another chiefly in their elongated form, soft rayed fins, and the tendency for the paired fins to become reduced in size. Although their seclusive habits render the eel-like fishes liable to be overlooked, and it is evident that many remain undiscovered, the number and diversity of those already known are very considerable. Ichthyologists have arranged them in numerous families and several orders, which Prof. Cope regarded as forming a series degenerate in respect to the gradual loss of the paired fins, and certain ossifications of the skull, and in the simplification of the gill arches. According to the classification of Jordan and Evermann, most of the eels fall within the order Apodes, the others chiefly within the *Plectospondyli*, *Symbranchia*, and *Carenchelyi*. The common eel or fresh-water eel (*Anguilla chrysa*, but also described under a number of other names) belongs to the first order and the family Anguillidae. It is doubtfully distinct from the European fresh-water eel (*Anguilla anguilla*). Both species are characterized—in addition to the serpent-like elongated body, the absence of ventral fins, and the continuity of the dorsal and anal fins round the

extremity of the tail—by the wide interval between the dorsal fin and the head, the projecting lower jaw, well developed pectoral fins, well ossified jaws and gill covers and nearly perfect gill arches. Contrary to the common belief eels are not scaleless but numerous small scales are embedded in the skin. The life history of the eel is very remarkable and in some respects unique. During the spring and early summer multitudes of young eels several inches long migrate up the rivers from the sea and distribute themselves throughout every accessible body of water, whatever its size or character, frequently traveling overland to reach these. Here they remain concealed in the mud or beneath stones and feed on all kinds of animal matter, living and dead, in the pursuit of which they are relentless. Many eels appear never to leave the fresh waters in which they have developed, but most of them after several years return to the sea and enter comparatively deep waters, where sexual maturity and spawning takes place. From the egg a peculiar, compressed, transparent, pelagic larva (*Leptocephalus brevirostris*) is produced, which in due time generally metamorphoses into the young eel which in turn leaves the sea. Some individuals, however, appear to remain permanently in salt as others do in fresh water.

Both in America and in Europe eels are an important and very excellent food fish, and great quantities are caught in a variety of ways. In the United States use is made of hand and set lines, eel spears, eel pots, and weirs. The last is the most efficacious method, but owing to its serious destructiveness of shad and other fishes its use is frequently prohibited by law. A V-shaped fence or net is arranged across the stream with a basket placed in a small opening at the apex, into which the eels are guided by the leads and from which they are unable to extricate themselves. In England river eels are caught in great numbers by means of eelbucks, or eel-pots, traps consisting of a kind of basket with a funnel-shaped entrance composed of willow rods converging toward a point, so that the eels can easily force their way in but cannot return. A stocking or tube of coarse cloth hanging from an aperture of a box down into the interior is also used. A kind of trident, called an eel-spear, is used also for taking them. A fisherman wades to the shallows, and, striking his spear in the mud in every direction around him, the eels reposing on the bottom are caught between the prongs. Except a few other species of the same genus as the common eel all eels are strictly marine and are especially numerous in tropical seas where, in the interstices of coral reefs, as also in the deep sea, some very remarkable kinds occur. For an account of the species consult Jordan and Davis, Report U. S. Fish Commission for 1888; Jordan and Evermann, Bulletin U. S. National Museum, No. 47, Pt. I.; and Goode and Bean, 'Oceanic Ichthyology.' See also articles: CONGER EEL; ELECTRIC EEL; SNIPE EEL; MORAY; PELICAN FISH; SNAKE EEL, etc.

Eel-grass, or **Grass-wrack**, a common name for a marine grass, *Zostera marina*, of the pondweed family (*Naiadaceæ*). The leaves are narrow and ribbon-like, blunt at the end, sometimes six feet in length. The flowers are crowded in a spadix. It is found in bays or

streams along the Atlantic coast from Greenland to Florida, and on the Pacific from Alaska to California, also on the shores of Europe and Asia. The genus *Zostera* (from the Greek, referring to the ribbon-like leaves), comprises six genera, of which two besides the eel-grass are found in America. They are all marine plants, and are found on the coasts in the north temperate zone.

Eel-pout, the name of various fishes. It is applied in the United States to the burbot or ling of the Great Lakes and to the mutton-fish; in Great Britain to the burbot (q.v.), and in northern Africa to the electric catfish (*Malapterurus*).

Eells, Myron, American Congregational clergyman: b. Walker's Prairie, Wash., 7 Oct. 1843. He was graduated at Pacific University, Ore., 1866, and at Hartford Theological Seminary 1871. He was pastor at Boise City, Idaho, 1872-74, later serving as missionary to the Indians at Skohomish, Wash., where he filled the pulpit of the Congregational Church 1876. Among his works are: 'History of Congregational Association of Washington and Oregon' (1881); 'History of the Indian Missions on the Pacific Coast' (1882); 'Ten years at Skohomish' (1886); 'Father Eells' (1894).

Eelworm, or Vinegar Eel (*Anguillula aceti*), a small *Nematoda* (q.v.) worm of the family *Anguillulida*, often found in immense numbers in good cider vinegar or in sour paste, where it feeds on the mucilage and organic fluids. It is just visible to the naked eye and wriggles very actively. Like many related species it is very resistant to dessication and other influences ordinarily destructive to animal life. A vast number of similar species live in the earth and feed on decaying organic matter, others are parasitic on plants, in which they are at least the partial causes of certain very serious diseases; thus *Tylenchus devastatrix* causes the "clover disease" and *Heterodera schachtii* the still more destructive "beet sickness," which sometimes devastates the sugar beet crop of Germany.

Effen'di, a title of respect among the Turks, bestowed on civil officials, and on educated persons generally, in contradistinction to the military title of *aga*. It is nearly equivalent to the French *Monsieur*, but is suffixed to the personal name.

Eff'igy, formerly **Effigie**, (1) a copy or imitation of an object, an image or likeness; in sculpture frequently applied to the figures on sepulchral monuments; (2) to execute or degrade, as the execution or degradation of a condemned criminal, when he cannot be personally apprehended, by subjecting his image to the formalities of an execution; for instance, affixing the image with a rope round the neck to the gallows (hanging in effigy). This practice is not altogether extinct in Prussia, and in other countries; but in England it has become merely a mode in which the populace expresses its feelings respecting an obnoxious personage; such as the English custom of parading and burning the effigy of Guy Fawkes on 5 Nov.

Ef fingham, Ill., city, county-seat of Effingham County; on a branch of the Wabash River, about 240 miles south by west of Chicago, and on the Illinois C., the Wabash, and Vandalia

R.R.'s. The city is the trading point of an agricultural region, and has some small manufacturing. It contains Austin College and a large photographic school. Pop. 3,825.

Efflores'cence, a term applied to crystals, which, on exposure to the air, lose water of crystallization and crumble down into a powder. The most familiar instance is that presented by the glassy crystals of washing soda, which become white and pulverulent in the air. The same phenomenon is also presented by phosphate of sodium, borax, and other compounds. Another application of the word is to the fine white, feathery crystallization of sulphate and carbonate of sodium which appears on walls, or similar crystallizations on the surface of the earth, in decomposing rocks, etc. Efflorescence is in some respects the opposite of deliquescence, and the difference is shown by placing an efflorescent and deliquescent body under a bell-jar. The former gives up its water, which the latter absorbs, becoming thereby fluid. See CRYSTALS.

Effu'sion (Lat. "to pour out"), in physics and chemistry, the escape of a gas into a vacuum, through a small opening (such as a pin-hole) in a thin partition. So long as the temperature of the gas is constant, the velocity of effusion is independent of the pressure. For the same gas at two different temperatures (but at the same density), the velocity of effusion varies directly as the square root of the absolute temperature. The velocities of effusion of two different gases (both at the same constant temperature) are inversely proportional to the square roots of the densities of the gases; the densities being determined by comparison under convenient but identical conditions of temperature and pressure.

Eft, a name given to several species of newts, especially to the common smooth newt (*Lissotriton punctatus*). The eft has a slightly free tongue, double longitudinal series of palatal teeth, and nailless toes, four before and five behind. The skin is smooth; the dorsal and caudal crests are continuous; there are two patches of glandular pores on the head, and none on the back or sides. The color in the male is brownish gray above, passing into yellowish beneath, which in the spring becomes bright orange; there are numerous round dark spots of unequal size, and two longitudinal streaks on the head; the crest in spring is often tipped with red or violet. The female is light yellowish brown, or buff with brown dots, plainer below. The total length is about 3½ inches, of which the tail is nearly one half. It is very common in the ditches and ponds of Europe, especially where the water is clear. Its food consists principally of aquatic insects, larvæ, worms, and mollusks. The reproduction and metamorphosis are almost identical with those of the newts. Though usually spending most of their time in the water, the young in June, and the adults in summer and autumn, become terrestrial; they appear to attain their full size the first year. Their bite is perfectly harmless. They are eaten by the larger amphibians, by fishes, and by various reptiles, birds, and small mammals.

E'gan, Maurice Francis, American author: b. Philadelphia 24 May 1852. He was graduated at La Salle College; and was subsequently

professor of English literature in the University of Notre Dame, Ind., and professor of English language and literature in the Catholic University of America in Washington, D. C. His publications include: 'That Girl of Mine' (1879); 'Preludes' (1880), a book of poems; 'Songs and Sonnets' (1885); 'The Theater and Christian Parents' (1885); 'Stories of Duty' (1885); 'A Garden of Roses' (1886); 'The Life Around Us' (1886); 'Studies in Literature'; 'The Watson Girls'; etc.

Egan, Patrick, American politician: b. County Longford, Ireland, 1841. He became identified with the Nationalists and the Home Rule Movement in 1871, and was one of the organizers of the Irish Land League. He was tried in Dublin in 1880 for conspiracy and sedition, going to Paris upon his acquittal. He came to the United States in 1883, and was president of the Irish National Land League of America 1884-86. He testified before the Parliamentary Commission 1889, and was instrumental in securing the failure of the case of the London *Times* against Parnell. He was appointed minister plenipotentiary to Chile as a reward for his speeches in the campaign of 1888. In Chile he espoused the cause of Balmaceda, the Liberal Dictator. Later he left the Republican party, becoming what was termed a Free Silver Democrat, and taking part in the subsequent campaigns in favor of that issue.

Egan, Pierce (the Elder), English sporting writer: b. London 1772; d. there 3 Aug. 1849. A prolific "historian of the ring" and kindred institutions, he wrote 'Boxiana' (1818); and the widely popular 'Life in London' (1821); which was illustrated by Cruikshank.

Egan, Pierce (the Younger), English novelist: b. London 1814; d. there 6 July 1880. He was a son of the preceding. At first an artist, he turned to fiction, winning fame with 'Robin Hood' (1840); 'Wat Tyler' (1841), and similarly conceived romances; while his later and more sensational tales, 'Imogen'; 'Fair Lilies'; and others, appeared for the most part as serials only.

Egaña, Juan, hoo-ān' ā-gā'ña, Chilean author and statesman: b. Lima 1769; d. Santiago, Chile, 13 April 1836. He took an active part in the revolution, was a member of the first Chilean Congress, was captured and imprisoned on Juan Fernandez Island, but was liberated in 1817, and was again a member of Congress until elected president of the Republic in 1823. He was a voluminous writer, both of poetry and prose, his works including several educational text-books. He exercised great influence in shaping the character of the people and the policy of Chile.

Egbert, king of Wessex: b. about 775; d. 837. On the death of Alcmund, the former king, Brihtric, a powerful noble, succeeded in ousting Egbert, who had the best claim to the throne, and was compelled to take refuge first in the court of Offa of Mercia, then in that of Charlemagne. On the death of Brihtric he succeeded him as king of Wessex, in 800. He reduced the other kingdoms, and rendered them dependent on him, in 827, and is thus considered the first king of all England.

Egbert, Harry C., American military officer: b. Pennsylvania 3 Jan. 1839; d. 4 March 1899. He entered the army as first lieutenant in September 1861; was promoted captain in 1865; major in 1890; and colonel on 1 July 1898. In October of the latter year he was commissioner brigadier-general of volunteers. When the war with Spain broke out he commanded the 6th Infantry, of which he was lieutenant-colonel. In the Santiago campaign, while leading a charge at El Caney, 1 July 1898, he was shot through the body. He had scarcely recovered from his wound when he applied for service in the Philippines. He arrived at Manila with his regiment 4 March 1899, and was killed while storming Malinta, on the 26th.

Egbert, James Chidester, Roman archaeologist and epigraphist: b. New York 1859. He was graduated at Columbia University in 1881, and held a prize fellowship (1882-85). He began to teach in the University in 1885 and was adjunct professor of Latin 1885-90. In 1890 he was appointed professor of Roman archaeology and epigraphy in Columbia, and while he has done much to promote the study of these special subjects, and has published: 'Introduction to the Study of Latin Inscriptions,' he has also edited 'Cicero de Senectute'; and written 'Macmillan's Shorter Latin Course.'

Egede, Hans, hänts ā'gē-dē, Danish missionary, termed the apostle of Greenland: b. Harstad, Norway, 1686; d. Falster, Denmark, 1758. In 1707 he became a preacher at Wogen. Having heard that Christianity had been once established in Greenland, but had become extinct in the country for want of teachers, he resolved to visit the country, and to preach the gospel to the inhabitants. Having received from the Danish government the title of royal missionary to Greenland, with a small pension and three ships, he sailed on 21 May 1721 with 46 persons under his command. Egede landed on 4 June, and the conversion of the Greenlanders was now undertaken, but offered great difficulties. Egede took up his residence, with his two sons, among the natives, in order to learn their language, and so be able to carry out his project of conversion. He carefully noted down every word of which he discovered the meaning; often performed long journeys, at the peril of his life, to visit the remotest Greenlanders, for the purpose of gaining their confidence, in which he succeeded by a thousand acts of kindness. After spending fifteen years in Greenland, amid innumerable discouragements, he returned in 1736 to Copenhagen, to make new exertions for the support of Christianity in that country. The government appointed him director of the Greenland missions, and established his son Paul in the office of missionary there. His writings are in Danish, and relate to the natural history of Greenland, and his sufferings and adventures there.

Egede, Paul, Danish missionary: b. 1708; d. Copenhagen 1789. He was a son of Hans Egede and was his assistant from the time he was 12 years old. Notwithstanding a strong inclination for the naval service, he submitted to the wishes of his father, studied divinity, joined the mission in Greenland in 1734, and remained there till 1740. He then returned to Copenhagen, and afterwards was appointed

Bishop of Greenland. We have from him an 'Account of Greenland,' extracted from a journal kept from 1721-88; 'Dictionarium Grœnlandicum'; 'Grammatica Grœnlandica'; and translation of the Gospels, the 'Imitation of Christ,' etc., in the Greenland tongue.

Egelhaaf, ä'gël-häf, **Gottlob**, German historian: b. Gerabronn, Würtemberg, 1 March 1848. He has published: 'A History of Germany During the Reformation' (3d ed. 1893); 'Emperor William' (3d ed. 1888); 'A History of Germany During the Sixteenth Century until the Peace of Augsburg' (1888-92); and other works.

Eger, ä'gër, Bohemia, town in the northwest, on a rocky eminence above the Eger, 91 miles west of Prague. It was once an important fortress, founded in the 12th century. Six lines of railroads converge at Eger. There are various industries, including machinery, wool, cotton, and leather manufactures, and a flourishing trade. The celebrated Wallenstein was assassinated here (1634). Franzensbad, a watering place, is connected with Eger by an avenue three miles long. Pop., of the commune, 24,200.

Eger, a river which rises in Bavaria, in the Fichtelgebirge, 12 miles northwest of the town of Eger, flows first southeast, then takes a northeasterly direction into the Elbe, near Leitmeritz, in Bohemia, after a course of about 190 miles.

Egeria, ê-jër-î-ä, (1) a nymph who received divine honors among the Romans. Numa is said to have had secret conversations with her, and to have received from her the laws which he gave to the Romans. Some say Egeria was the wife of Numa. (2) a genus of spider crabs of the family *Maidæ*; (3) a genus of bivalve shells of the family *Donacidae*; (4) in astronomy, the thirteenth planetoid, discovered by De Gasparis, at Naples (1850).

Egerton, ej'ër-tôn, **George** (pseudonym of MRS. MARY CHAVELITA DUNNE MELVILLE CLAIRMONTE BRIGHT), English novelist: b. Australia 14 Dec. 1860. She was married in 1888 to H. Melville, who died in 1889; in 1891 to Egerton Clairmonte, who died in 1901; and in 1901 to R. G. Bright. She has traveled extensively, visiting the United States four times. She has published: 'Key-notes' (1893); 'Discords' (1894); 'Young Ofeg's Ditties' (1895); 'Symphonies' (1897); 'Fantasias' (1898); 'The Wheel of God' (1898); 'Rosa Amorosa' (1901); 'The Hazard of the Ill' (1902).

Egg, Augustus Leopold, English painter: b. London 2 May 1816; d. Algiers, Algeria, 26 March 1863. He became a contributor to the Academy exhibition in 1838, and was elected a member of the Royal Academy in 1860. He painted a great number of pictures illustrative of humorous scenes from Shakespeare, Le Sage, and Walter Scott.

Egg. A cell (ovum) developed in the female reproductive organ (ovary) of any metazoic animal, which, when joined with a male cell (spermatozoon) develops under suitable conditions into an organism like the parents. For the structure of the egg, which differs from other cells only in its germinative property, see CELL; and for its processes of development, see EMBRYOLOGY.

Animals in which the egg passes out of the body before it is hatched, that is, before the maturity and escape of the embryo, are said to "lay eggs," or to be "oviparous"; those in which the egg remains inside the body to hatch are called "ovoviviparous"; those whose eggs are retained in connection with the parent by means of a placenta and an umbilical cord, so that the young are brought forth alive are called "viviparous." These distinctions, and especially the first two, are of secondary importance, and in some cases it is difficult to classify an animal according to them: or varying conditions may lead to change in the same species or individual at different times. A few lowly mammals (the *Monotremes*, q.v.), all birds, and most other animals, "lay" their eggs. The ovoviviparous ones are to be found chiefly among reptiles and fishes.

As in all the higher animals the development of the egg is prolonged, and the young animal must reach a comparatively perfect state of development before it leaves the egg; provision for its nutrition during embryonic development must be made by the storage of food in the egg to be gradually absorbed by the growing embryo; also room for growth, and therefore such eggs are always relatively large. The food is primarily the yolk, which is distinctly yellow in the eggs of birds, reptiles and amphibians, and consists of granules of albuminous and fatty matter perfectly adapted to the nutrition of the young. It lies in concentric layers about the whitish germinal vesicle or "tread" of the egg, which is the protoplasmic part where alone development proceeds. This vesicle floats on the surface of the food-yolk, and remains on top, by reason of its lightness, no matter how the egg is turned. The eggs of many of the lower animals contain food-yolk, but it is usually colorless. The egg of a hen or other bird is further furnished with layers of albumen (the "white") placed upon it in the narrow upper part of the oviduct. Outside of this there is next deposited upon the albumen a fibrous membrane of double thickness (the "egg-pod"), the splitting of which later forms the "air-chamber" at that end of the egg where the head of the chick lies. In a further stage of descent along the oviduct there is deposited in and upon the egg-pod an external covering, or "shell," which may be gelatinous as in the amphibians, or chitinous as among insects, or parchment-like as in reptiles, or calcareous in various degrees, as is familiar in birds' eggs. This shell is porous, so as to admit air to the embryo, which also exposes it to bacteria, so that eggs are liable to quick decay as soon as living influences cease to operate upon it; and preservative methods are directed toward excluding air and germs by closing the pores of the shell. The evil odor of decayed eggs is due to the liberation of sulphuretted hydrogen and certain sulphur proteids, sulphur having a large part in the composition and color of food-yolk. The shells of eggs are often oddly and elegantly shaped, differ greatly in texture and ornamentation, those of insects especially being often exquisitely chased, or studded with projections, and are otherwise beautiful objects under the microscope. Kirby and Spence describe in detail an extraordinary variety, including many which have hinged lids so that the embryo may escape when ready without breaking its way out (see EGG-TOOTH), as do birds and reptiles. The eggs of a great variety

lopod crustacean.

19. Egg of branchiopod crustacean.

of birds are further ornamented by a uniform tinting or by spottings in diverse patterns and colors, which consist of peculiar pigments, derived from the blood and laid on at the time of the formation of the shell. These color-markings are characteristic of groups to a great extent, and are mainly combinations of yellow, red-brown and greenish-blue. Vast and valuable collections of the nests and eggs of birds exist in museums; and form the topic of the special science oölogy.

Considering the vast variety of animals, and the world-wide diversity of circumstances under which eggs are laid and of conditions which must be met, the greatest dissimilitude is to be expected. In size their range varies from the microscopic cells produced by most mammals to the huge egg of *epyornis* (q.v.), with a capacity of $2\frac{1}{2}$ gallons. The human ovum is among the smallest known, being a minute spherical body from 1-120 of an inch in diameter.

While the eggs of the vertebrates are spherical or nearly so (oblong or oval in various degrees), those of invertebrates often take strange polygonal forms, as is seen among the worms, lower crustaceans, and insects, some of which are illustrated on the accompanying plate. Equally diverse are the methods taken for protection of eggs against harm by weather or enemies, and in proportion as these have proved successful the number laid by each individual is decreased. Many marine animals, such as most worms, echinoderms, cœlenterates, bivalve mollusks, and fishes pour out millions of ova, or "spawn," most of which serves only as food for other aquatic animals, probably not a tenth of 1 per cent in many cases ever approaching maturity. Creatures above the rank of the more lowly fishes lay comparatively few eggs—some only one annually. This is also true of certain insects, spiders, crabs, and mollusks, where habits of so hiding or protecting the eggs have been acquired that a large proportion are fertilized and hatched. The methods and adaptations for safety observable among insects are exceedingly varied and effective. Some bury their eggs in the ground, or in dead wood, or living wood, or even in the bodies of dead or living animals; some drop them loose into water, or fasten them to a support under its surface; they hide them in all sorts of crannies, glue them firmly to plants, twigs, rocks, or the skin and hairs of other animals. In the majority of cases this protection must withstand the test of resisting prolonged unfavorable conditions, for most species are preserved from year to year only by the hibernation or estivation of their eggs. Among aquatic animals the encasement of the eggs in a gelatinous envelope, as is so common with frogs, newts, and other amphibians; or a tough capsule, as among the cephalopod and many gasteropod mollusks (for example, Murex, Natica, Fusus) is a common method of protection. These egg-cases are often most curious in form and location.

Economical Value of Eggs.—The eggs of birds, especially of fowls, and of some reptiles, as turtles, are commonly used for food. Boiled eggs are less nutritious because the hardened albumen is with difficulty digested. A hen's egg of good size weighs about 1.000 grains, of which the white constitutes 600, the yolk 300, and the shell 100. There are generally 10.7 parts shell, 11.9 parts albumen, 12.8 parts fat, .7 parts salt,

and 63.9 water. According to Leppig, the specific gravity of fresh eggs is not less than 1.06 grams, and loses 0.0017 grams a day when kept in the open air; so if an egg sinks in a salt solution of 1.05 specific gravity, the egg is fresh. Besides their use as a food, hen's eggs are used in the technical arts, the albumen in which they are so rich being serviceable in dyeing, manufacture of leather, and for various other purposes.

To preserve eggs for any length of time, they must be kept from the air. They may be rubbed over with butter, lard, gum-water, etc., set on the small end upon a perforated board, or, which is still better, they are placed in layers, upon the small end, in very dry ashes, in dry salt, etc., enclosed in tubs and boxes, and put in a dry place, protected from severe cold in winter, but at the same time not too warm.

Eggs are of great importance in a commercial point of view. In England vast quantities are brought from the country to the large towns, but not in sufficient numbers for the demand, and they are largely imported from the Continent, chiefly from France, Germany, Russia, Belgium, and Denmark, also from Canada, the United States, Egypt, Morocco, and other countries. The value of eggs imported into the United Kingdom is more than \$25,000,000 annually.

In the United States the egg industry has grown during recent years to vast proportions. Formerly this country relied largely upon importation for its supply of eggs, but now it exports far more of them than it obtains from foreign parts. The increasing use of incubators has led to a large increase in the number of eggs laid by native fowls, which need "no longer waste their time in hatching them, but may devote it to the more profitable labor of producing them." It is said by experts in this branch of American industry that although the number of fowls kept in this country is now relatively smaller than formerly, yet by the adoption of labor- and time-saving machines the lesser number has been able to produce a constantly increasing output of eggs.

The production of poultry and eggs is one of the most profitable industries. A statistician of authority estimates that a hen may realize 400 per cent profit for her owner. In 33 States and Territories the value of eggs exceeds the value of the poultry product. The egg product in the United States amounts to more, when measured by dollars and cents, than the combined gold and silver production. Prices have not fallen with the introduction of the incubator.

The value of the annual output of eggs is now \$145,000,000. In their production Iowa leads the States, its yearly product being 100,000,000 dozen. Ohio comes next with 91,000,000 dozen; Illinois third, 86,000,000 dozen; and Missouri fourth, 85,000,000 dozen. With the exception of Alaska and Hawaii, Montana pays the highest price for eggs, the average price being 20 cents a dozen. They are cheapest in Texas, where the average price in 1902 was $7\frac{1}{2}$ cents a dozen. The average price for the 16,000,000,000 eggs which were marketed in the United States that year was 11.15 cents a dozen.

The railroad men of the country have an excellent opportunity to measure the extent of the egg industry in concrete exhibits. The annual output fills 43,127,272 crates holding 30 dozen each. An ordinary refrigerator car, which has

EGG — EGGELING

an average length of 42.5 feet, holds 400 crates. It is calculated that a train of these cars sufficient to carry the annual product would be 866 miles long, or long enough to reach from Washington to Chicago, and have several miles to spare. A government expert says: "The majority of the fowls of this country are found in comparatively small numbers on a very large number of farms, where they gather their own subsistence and receive practically no care. The consequence of this is that eggs are produced at little cost. The development of this industry to an extent incredibly larger than it is at the present time is among the easy possibilities."

Egg, or Eigg, ěg, one of the Hebrides Islands, belonging to Inverness-shire, Scotland. It is south of Skye. Its length is a little less than seven miles.

Egg-bird, or Sooty Tern (*Sterna fuliginosa*), a member of the gull family (*Laridae*) famous for its edible eggs and breeding societies or "wide-awake fairs." It is found about warm seas throughout the world and abounds in the West Indies. Ascension Island is one of its most frequent breeding places. Occasionally it wanders as far as New England. The adults have beautiful black and white plumage, but the young are of a light, sooty color. The nests are rough excavations in the sand, in which three eggs are usually deposited. They are much valued and the gathering of them in the spring months forms an important West Indian industry. The name egg-bird is also commonly applied to other marine birds of the gull family, as guillemots, murre, etc., whose eggs are of economic value.

Egg Dance, a once popular diversion in England, Scotland, Holland, and some other parts of Europe; now confined chiefly to Spain, among the people of Valencia. A number of eggs were arranged in a prescribed form upon the dancing floor, and among them a blindfolded dancer moved as best he might, to music; the object being to execute an intricate dance without breaking the eggs. The music, like the arrangement of the eggs, was also prescribed.

Egg-eating Snake, the *Dasypeltis scabra*, a tree-climbing species of coluber found in Central and South Africa. It is about two feet in length and is unique in its adaptation to the diet from which it derives its name. While the jaws are almost destitute of teeth and capable of great distention, a substitute for the teeth is found in the elongated hypophyses or ventral processes of several of the cervical vertebrae, which project into the interior of the oesophagus as a series of saw-like teeth tipped with very hard cement substance. This mechanism enables the snake to secure the entire contents of an egg as large as a hen's without losing a drop, for it is swallowed entire and only broken by contact with the oesophageal teeth when safely within the throat, when the contents are swallowed and the shell regurgitated.

Egg-fish, any of various plectognath "globe-fishes," which swell themselves into the shape of an egg. See PLECTOGNATHI; PUFFER.

Egg-flip, a drink made of warmed beer, flavored with a little sugar, spirit, spices, and eggs beaten with it.

Egg-nog, a drink consisting of the yolk of eggs, beaten up with sugar, to which milk is added, and also usually some kind of spirits. By using the whites of the eggs an agreeable froth is made.

Egg-plant, Guinea Squash, or Aubergine (*Solanum melongena*), a plant of the natural order *Solanaceae*. Its original home is supposed to be the East Indies, where it has long been cultivated and from whence it has been introduced into all tropical countries and many temperate ones for the sake of its egg-like white, yellow, or purple fruits, which are used as a vegetable. In the United States it is cultivated as far north as Long Island and southern Michigan. In the North the plants must be started under glass, and transplanted to the field or garden after danger of frost has passed. They do best upon rich deep loams well exposed to the sun. Their principal insect enemies are practically the same as those of the potato and are combated similarly. (See INSECTICIDE.) Their fungous diseases are few and rarely devastating. The principal ones are a bacterial disease caused by *Bacillus solanacearum*, for which there seems to be no satisfactory remedy; anthracnose (*Glauosporium melongena*), which appears as pink-spotted sunken areas upon the fruits; leaf-spot (*Phyllosticta hortorum*), which turns the affected leaves brown and produces holes in them; and a mold (*Botrytis fascicularis*), which produces soft spots with gray moldy surfaces upon the fruits. Each of these parasites may appear upon any of the green parts, but the parts mentioned are the usual ones. They may all be controlled by timely applications of any standard fungicide.

Egg-tooth, the hard calcareous protuberance at the tip of the beak or snout of a chick or young reptile which is born within an egg having a tough shell, designed to assist the embryo in escaping. It wears a hole through the lining membrane of the egg, and then acts as a file to bore through the outer shell or wedge apart any crack. It is possessed by all birds, and by such reptiles (turtles, lizards, and snakes) as develop in eggs with hard coverings. Soon after the embryo goes free this excrescence falls off; and in this special temporary provision for a special non-recurring exigency, Darwin found an example, in his view, of the results of natural selection.

Egg-urchin, or Sea-egg, any of the typical globose sea-urchins, especially those of the genus *Echinus*. Similarly, the flat, bun-shaped echinoderms are called "cake-urchins," the cockle-shaped (spatangoids) "heart-urchins," and so on. See ECHINODERMATA; SEA-URCHIN.

Ėgga, ěg'a, West Africa, town of Gando, in the Niger Territories, on the Niger. Pottery, iron, gold, and wooden-ware, thick cloth, generally dyed blue, and leather are manufactured, and an active river trade is carried on, especially in ivory. Pop. 12,000.

Eggar-moth. See EGGER-MOTH.

Eg'geling, Julius, English philologist; b. Hecklingen, Germany, 12 July 1842. After studying at Breslau and Berlin, he went to England in 1867 and on account of his knowledge of Sanskrit was appointed secretary and librarian of the Royal Asiatic Society 1869, becoming professor of Sanskrit at University College 1872 and

filling the same chair at the University of Edinburgh three years later. Among his publications are 'The Catapatha-Brahmana, Translated according to the Text of the Madhyandina School' (1882-5); 'Catalogue of Buddhist Sanskrit Manuscripts in the Possession of the Royal Asiatic Society' (with Cowell 1875); the article, 'Sanskrit Language and Literature,' in the *Encyclopædia Britannica*; 'Catalogue of Sanskrit Manuscripts in the Library of the India Office' (1887-9); and editions of 'Vardhamana's Ganaratnamahodadhi' (1879-80); the 'Katantra' (1874-8); and of the 'Kanva Satapatha Brahmana' (1902).

Egger-moth, the name of certain species of moth, of the genus *Lasiocampa* or *Gastropacha*, allied to the silkworm moths. Several species are found in European countries.

Eggleston, Edward, American novelist and miscellaneous writer: b. Vevay, Ind., 10 Dec. 1837; d. Joshua's Rock, Lake George, N. Y., 3 Sept. 1902. He entered the ministry of the Methodist Church, and was more or less engaged in pastoral work for a number of years, at the same time contributing to various periodicals, for some of which he acted as editor. From 1874 till 1879 he was engaged in the work of an independent church founded by himself (the Church of Christian Endeavor, Brooklyn), but in the latter year his health failed and he resigned his position as pastor. Subsequently he devoted himself entirely to literary work. Among the most important of his works are: 'The Hoosier Schoolmaster' (1871); 'The End of the World' (1872); 'Mystery of Metropolisville' (1873); 'Schoolmaster's Stories for Boys and Girls' (1873); 'The Circuit-Rider' (1874); 'Christ in Literature' (1875, edited); 'Christ in Art' (1875, edited); 'Roxy' (1878); 'The Hoosier School-boy' (1883); 'The Graysons: a Story of Illinois' (1887); 'History of the United States and Its People' (1888); 'Household History of the United States and Its People' (1888); 'The Faith Doctor' (1891); 'Duffels,' a series of short stories (1893); 'The Beginners of a Nation' (1896); and 'The Transit of Civilization' (1900). His work as an historian possessed much merit, in that it was based upon careful investigation and exhibited sound judgment. Yet is it by his early stories of the Middle West that he will always be best known. These stories gave to those who read them at that time a real delight. They were written without the slightest trace of literary art; but their themes were wholly novel, and the unstudied simplicity of their narrator made them so natural and so life-like as at once to charm and surprise all sorts of readers. 'The Hoosier Schoolmaster' may be regarded as the first of a class of stories of which 'David Harum' and 'Eben Holden' are much later examples. The book, in reality, marked a new departure in our national literature; for it owed absolutely nothing to any model, but was a tale told directly from life, and from American life of a primitive kind which had not before made its way into printed books.

Eggleston, George Cary, American journalist and author: b. Vevay, Ind., 26 Nov. 1839. He is a brother of E. Eggleston (q.v.). During the Civil War he served in the Confederate army. He has long been connected in an editorial capacity with one or another New York news-

paper, including the *World*, the *Evening Post*, and the *Commercial Advertiser*. Among his many books are: 'A Man of Honor' (1873); 'A Rebel's Recollections' (1874); 'How to Educate Yourself' (1872); 'How to Make a Living' (1875); 'The Wreck of the Red Bird' (1882); 'Red Eagle'; 'Juggernaut' (with Dolores Marbourg) (1891); 'A Carolina Cavalier' (1901); 'Dorothy South' (1902); 'The Master of Warlock' (1903); 'A Captain in the Ranks' (1904).

Eg'ham, England, village in the County of Surrey, on the Thames, about 21 miles from London. It contains the Royal Indian Engineering College, the Royal Holloway College for Women, and the Holloway Sanatorium. Runnymede, where King John signed Magna Charta, is in Egham parish. Pop. 10,187.

Egil Skallagrimsson, ā'gīl skāl-lā-grīmz'-sōn, Icelandic bard or skald of the 10th century. He distinguished himself by his warlike exploits and adventures in Norway, Denmark, and England. Having killed in combat the son of Erik Blóðöx, king of Norway, he was doomed to death on being subsequently taken prisoner by that prince in Northumbria, but was allowed to redeem his life by giving a specimen of his powers as an improvisatore. He immediately composed and recited a poem in praise of Erik, known as 'Egil's Ransom,' which procured him his life and liberty. This piece (as well as two others attributed to him) is still extant, and Dr. Percy translated it into English, and printed it in his 'Northern Antiquities.' Egil is said to have been born about 901, and to have died about 980.

Egilsson, Sveinbjörn, svín'börn ā'gīlz-sōn, Icelandic critic: b. Gullbringasýsla 24 Feb. 1791; d. Reikiavik 17 Aug. 1852. He investigated the native antiquities, edited a series of Icelandic historical works, and completed a 'Poetic Lexicon of the Ancient Tongue of the North' (1855-60), published posthumously.

Eginhard, ā'gin-härd, or **Einhard**, in'härd, German historian: b. East Franconia, now the Grand Duchy of Hesse-Darmstadt, about 770; d. Seligenstadt 14 March 840. He was educated in the schools of the abbey of Fulda. When about 25 he entered the service of Charlemagne and thereafter was in all things the confidant of the emperor and one of his principal ministers. One of his great charges was the construction and repair of the public buildings. He was inseparable from the emperor, residing in the palace and accompanying him in all his journeys and expeditions: the only time when they were temporarily separated was when, in 806, the secretary—for such he has always been called—went to Rome to obtain the approval of the Pope of a provision of Charlemagne's testament or will for a division of the empire among his sons after his death. That Eginhard possessed considerable learning appears from his extant writings. During his many years of study at Fulda he acquired all the secular knowledge obtainable in his time, and in the palace of Charlemagne enjoyed the advantage of converse with the celebrated Alcuin. It was on the advice of the secretary that Charlemagne in 813 made his eldest son, Lewis, his partner in the empire; and when Lewis, on his father's death, became sole emperor, he retained Eginhard in all his high offices and appointed him tutor of his son

Lothair. In 830 he withdrew from the court and retired to his large estates at Mulinheim, where he had erected a splendid basilica and founded various religious institutes, and there passed the remainder of his life. He changed the name of the place to Seligenstadt (City of the Saints, namely, of Saints Marcellinus and Petrus). In this basilica he was entombed, beside his wife, Imma, who died four years before him. According to an old legend Imma was a daughter of Charlemagne, and as time went on the story of their love adventures was added to from the fount of romantic imagination: in fact, Charlemagne had no daughter named Imma, and the lady Imma who was Eginhard's wife was the sister of Bernharius, bishop of Worms. Eginhard's 'Life of Charlemagne' (*Vita Caroli Magni*), written in Latin in a style and on lines imitative of Suetonius' 'Lives of the Cæsars,' is one of the most notable literary monuments of the Middle Ages; it was long used as a manual of school instruction and hence has survived in a multitude of manuscript copies. Another work of his is a history of the Franks, 'Annales Regum Francorum, Pippini, Caroli Magni et Hludowici Imperatoris' (Annals of the Frankish Kings Pippin, Charlemagne, and Lewis the Emperor). There are extant 62 of his 'Letters' (*Epistolæ*), and a narrative of the translation from Rome to Seligenstadt of the relics of Saints Marcellinus and Petrus ('Historia Translationis Beatorum Christi Martyrum Marcellini et Petri'). To the narrative he appends a poem on the same subject.

Eglantine, ěg'lân-tĭn or -tĭn, the name of the sweet-brier rose (*Rosa rubiginosa*), in the poetry of Chaucer, Spenser, and Shakespeare. The name is common among the English poets; the earlier ones applied it to any wild rose, and Milton seems to confound several different species, among them the honeysuckle, etc. The flower is a native of Europe and Asia, but was easily naturalized in America and, being hardy, it withstood the severe winters, and now grows in profusion in the territory from Nova Scotia to Ontario, south to Tennessee, and east to the shores of Virginia. It is from 4 to 6 feet high, sometimes growing as a long spine-covered wand. The pink or white flowers are a marked feature of the flora of this region, during the months of June and July. A climbing-shrub, native of Asia (*Rosa eglanteria*), with yellow, ill-smelling flowers, is also sometimes called eglantine.

Eglantine Sponge, a rose gall. See BEDEGNAR.

Egleston, Thomas, American mineralogist: b. New York 9 Dec. 1832; d. there 15 Jan. 1900. He was graduated at Yale College in 1854, and at the School of Mines in Paris in 1860. He returned to the United States in 1861; and soon afterward was appointed director of the mineralogical collection and laboratory of the Smithsonian Institution in Washington. He established the School of Mines as a department of Columbia College, New York; and was professor of mineralogy and metallurgy there 1864-97. He was a United States commissioner to examine the fortifications of the Atlantic coast in 1868; and one of the jurors of the International Exposition at Vienna in 1873. He published: 'The Metallurgy of Gold and Silver in the United States'; 'A Catalogue of Minerals and

Their Synonyms'; 'Life of Major-General Paterson, of the Revolutionary Army'; etc.

Egli, Johann Jakob, yó'hân yă'kôb ä'glê, Swiss geographer: b. Uhwiesen-Laufen, canton of Zürich 17 May 1825; d. 1896. He was made professor of geography at the University of Zürich 1883, after teaching in several schools, and did much for the accuracy, precision and uniformity of the nomenclature of geography. Among his earlier works are a thesis on the 'Discovery of the Sources of the Nile'; and a 'Geography of Switzerland.' Later works include 'Nomina Geographica: Versuch einer allgemeinen geographischen Onomatologie'; 'Geschichte der geographischen Nomenclatur'; 'Neue Erdkunde'; 'Neue Handelsgeographie'; and 'Der Völkergeist in den geographischen Namen.'

Eglinton and Winton, Archibald William Montgomerie, EARL OF, English politician: b. Palermo, Sicily, 29 Sept. 1812; d. St. Andrews, Scotland, 4 Oct. 1861. He was lord-lieutenant of Ireland in 1852, and 1858-9. He was a well-known patron of the turf and field sports, and his name is associated with a splendid reproduction of a mediæval tournament, which he gave at Eglinton Castle in 1839.

Eg'mont, Justus van, Flemish painter: b. Leyden 1602; d. Antwerp 8 Jan. 1674. He was a pupil of Kaspar Van den Hoock 1651 and later of Rubens. He established himself at Paris where he became court painter to Louis XIII. and Louis XIV., and was also one of the founders of the Royal Academy of Painting and Sculpture 1648. Among his works are: 'Portrait of Archduke Leopold William'; two 'Portraits of Philip IV. of Spain,' Vienna Museum; 'Maria de Medici,' Schleissheim Gallery; and 'Portrait of Queen Christine.'

Eg'mont, Lamoral, COUNT, Dutch statesman: b. La Hamaide, Hainault, 18 Nov. 1522; d. Brussels 5 June 1588. He entered the military service, and gained a high reputation under Charles V.; distinguished himself as general of cavalry under Philip II.; and was made stadtholder of the provinces of Flanders and Artois. His connection with the Prince of Orange and his most distinguished adherents made him an object of suspicion to the Spanish court, and Egmont, with Philip of Montmorency, Count Hoorn, became the victims of hate and fanaticism. The Duke of Alva, sent by Philip II. to the Netherlands in 1567 to reduce the insurgents, had Egmont and Hoorn treacherously seized, and caused them both to be executed at Brussels. Egmont died with heroic firmness. He had before written to Philip II., that "he had never joined in any undertaking against the Catholic religion, nor violated his duties as a loyal subject." But the Prince of Orange having taken the field as the champion of his country's wrongs, an example was thought necessary to strike terror into the insurgents. There can be little doubt that the Spanish king unnecessarily dreaded the influence of the gallant soldier but incapable politician. When the troubles in the Netherlands broke out, Egmont, moved by generous sympathy for his injured countrymen, rather than by any fixed principle of action, was found side by side with the Prince of Orange, in the van of the malcontents. But in opposition to the popular movement came his strong feeling of

loyalty to Spain, and his still stronger devotion to the Roman Catholic faith. Thus, the opposite forces by which he was impelled neutralized each other, and, ever acting from impulse, he did not calculate the consequences of his conduct. When these consequences came he was not prepared to meet them. See Motley, 'Rise of the Dutch Republic,' Chap. II., part 3 (London 1861); Juste, 'Le Comte d'Egmont et le Comte Hoorn' (1862); Goethe, 'Egmont,' a drama; Brunelle, 'Éloge du Comte Egmont' (1820).

Egoism, ē'go-izm (Fr. *égoïsme*; Lat. *ego*, "I"), an ethical term used in the sense of selfishness; it is specially opposed to altruism. The word is sometimes used to denote a metaphysical system of subjective idealism, in which the Ego is the sole reality. See ALTRUISM; ETHICS.

Egoist, *The*, a novel by George Meredith, published 1879. It describes the experiences of Sir Willoughby Patternne, of Patternne, in selecting a wife.

Egret, ē'grēt, a name given to those species of white herons which have the feathers of the lower part of the back elongated and their webs disunited owing to the absence of barbules at certain seasons of the year, that they form a soft and flowing train reaching to the tail or beyond it. Their forms are more graceful than those of the common herons. The name is properly applied to two American and two European species. The American egret (*Ardea egretta*) has the plumage white, or partly of a creamy color. The bird is found breeding from Florida to New York, and along the shores of the Mexican Gulf to Texas, but ranges much beyond these limits at other seasons. Its food consists of the smaller quadrupeds, small fishes, frogs, lizards, snakes, and insects, and it breeds like other herons. The long silky filaments of the back are hardly to be seen, except about the love season, which varies from early spring to mid-summer according to climate; both sexes possess this train, and many are shot to obtain these feathers for ornamental purposes. The little white egret or snowy heron of America (*A. candidissima*) is much smaller and has a crest on the head which the large species lacks. In habits and distribution it is similar. The European egret (*A. alba*) is about 40 inches long, of a pure white plumage. It is common in southern Europe, but comparatively rare in the northern and central parts. The little egret (*A. garsetta*) is about 22 inches long from bill to end of tail; the plumage is white; from the hinder part of the head spring two narrow feathers four inches long. This species is most abundant in southern Europe and northern Africa; it occasionally wanders as far as England. The Louisiana heron (*A. tricolor*) and the reddish egret (*A. rufescens*) are often given the name, but the latter is white in winter only, and the former is partly colored at all seasons. Both are maritime birds, chiefly of the Gulf States.

Egusquiza, Juan Batista, hoo ān' bā-tēs'-tā ā-goos-kē'thā, Paraguayan statesman: b. Asuncion 1845. He was a lieutenant-colonel in the war with Uruguay, Brazil, and the Argentine republic, later being appointed secretary of war, and attaining the rank of general. He was elected president of Paraguay 1894.

Eguzquiza, ā-gooth-kē'thā, Rogliode, Spanish painter: b. Santander 1835. He studied at

the Ecole des Beaux Arts, Paris. Among his works are: 'Virgin with Rosary' (1859); 'Discussion Between Don Quixote and the Cure'; 'Michelangelo Beside the Body of Vittoria Colonna'; 'Charles V. at Convent of St. Juste' (1868), reproduced in popular engraving; 'Family Concert'; 'Master-at-Arms'; 'Portrait of Lady' (1878).

Egypt (Greek, Αἴγυπτος, *Aiguptos*; Hebrew, מצרים, *Micraim* or מצור, *Mazor*; also called פתרוס, *Pathros* (Is. xi, 11) and ארץ חם, *Erez-Ham*, "The land of Ham" (Ps. cvi, 22). Assyrian 𐎶𐎵𐎠𐎫𐎠𐎺𐎠, *Mucri*; Arabic مِصر, *Misr* or *Masr*.

In Hieroglyphics, 𓆎𓅓, *Kamt*). Its present name is derived from the Greek, *Aiguptos* (meaning obscure). The Hebrew name *Mizraim*, is the dual form of *Masor* (a fortified or walled-in place or country), viz., two *Mazors*, "Upper and Lower Egypt." But its principal name upon the monuments and in the papyri is *Kami* or *Kamt* "Black land", an appropriate name, owing to the black alluvial soil in the Nile Valley, in contradistinction to the reddish soil of the neighboring land on both sides of the Nile.

Modern Egypt is a vast country extending from the Mediterranean Sea, lat. 31° 35' to parallel 22° N. l., called Egypt Proper, thence southward to the British possessions in equatorial Africa, which latter region (known as the Egyptian Soudan) is jointly governed by Great Britain and Egypt. The eastern boundary is the Red Sea, and on the extreme northeast, Wady-el-Arish, Syria. The western boundary runs northwest to Tripoli, and thence southeast through the Libyan desert, to a point 200 miles west of Wady-Halfa. The area of Egypt is about 400,000 square miles, the country extending 675 miles north and south, and 500 miles east and west. Its population is about 11,000,000.

Topography.—In ancient as in modern times Egypt was always divided into the Upper and the Lower, or the Southern and Northern countries. At a very early period it was further subdivided into a number of departments, called *nomes*, varying in different ages; 42 was probably the usual number. A third great division, the *Heptanomis*, "seven *nomes*," preserved in the modern (*Wustani*) "Middle Egypt," was introduced at the time of the geographer Ptolemy, (first half of the second century A.D.). Each *nome* had a separate local government. In the 5th century A.D., Egypt was divided into six eparchies, Augusta Prima and Secunda on the east, *Egyptiaca* on the west, Arcadia (the former Heptanomis), Thebais Proxima as far as Panopolis, and Thebais Supra to Philæ. Under the Mohammedans, the triple division, Misr-el-Bahri (Lower Egypt); el-Wustani (Middle); and es-Said (Upper) has prevailed, but the number of subdivisions has varied. At present there are altogether thirteen provinces.

Egypt is connected with Asia by the Isthmus of Suez, across which runs the great canal, about 100 miles long. The inhabited portion of Egypt is mainly confined to the valley and Delta of the Nile, the widest part of which does not exceed 120 miles, while in many parts of the valley it is only from 3 to 15 miles wide, and at the southern frontier of Egypt proper, only two miles. West of the Nile are several oases. Two ranges of lofty mountains, the Arabian Hills on the East

EGYPT

and the Libyan on the West, enclose this valley. The Delta of the Nile is traversed by a network of primary and secondary channels, and is also intersected by numerous canals.

Seven principal channels or mouths were usually recognized in ancient times, the names of which, going from east to west, were the Pelusiac mouth, the Tanitic, the Mendesian, the Pathmitic, the Sebennytic, the Bolbitine and the Canopic. Now only the Bolbitine (called Rosetta) and the Pathmitic (Damietta), are in existence. The Nile has a current running seaward at the rate of $2\frac{1}{2}$ or 3 miles an hour, and the stream is always deep enough for navigation. The water becomes a reddish brown during the annual overflow; it is esteemed highly salubrious. Near the sea are the Lakes Menzaleh, Birket-el-Mariut and other extensive but shallow lagoons.

The openings or lateral valleys of the hills confining the valley of the Nile are comparatively few, or, being little frequented, are not well known. Those on the east side with which we are best acquainted are the Wady-el Tili, "Valley of the Wanderings" (of the children of Israel), leading from the neighborhood of Cairo to the head of the Gulf of Suez, and that through which passes the road from Koptos to Kosseir on the Red Sea. A short distance west of the Nile and above the Delta is the fertile valley of Fayoum, in the northwest and lowest part of which is the Birket-el-Kerun lake, fed by a canal or branch from the Nile. The level of the lake is now 130 feet below that of the Mediterranean. This lake, formerly known as Lake Moeris, covered a far larger area, and by means of sluices and other works was utilized for irrigation purposes. The deserts on the west bank of the Nile generally present to view plains of gravel or of fine drifting sand; on the east, the scene is varied by rocks and mountains.

Climate.—The atmosphere in Egypt is extremely clear and dry, the temperature regular and hot, though the heat is tempered during the daytime for seven or eight months of the year by the strong wind which blows from the north, and which enables sailing vessels to ascend the river against the stream. The winter months are the most delightful of the year, the air being cool and balmy, and the ground covered with verdure; later, the ground becomes parched and dry, and in spring the suffocating *khamseen*, or samoom, frequently blows into the Nile valley from the desert plains on each side of it, raising lofty clouds of fine sand, and causing great annoyance, until the rising of the river again comes to bless the land. It rains but rarely, except near the seashore. At Memphis the rain falls perhaps three or four times in the course of a year, and in Upper Egypt only once or twice, if at all; showers of hail sometimes reach the borders of Egypt, but the formation of ice is very uncommon. Earthquakes are occasionally felt, and thunder and lightning are neither frequent nor violent. Egypt is not remarkably healthy, especially in the Delta, where ophthalmia, diarrhoea, dysentery, and boils are somewhat prevalent. But many invalids now winter in Egypt, especially in the neighborhood of Cairo, or higher up the river, where the air is dry and pure.

The Nile, Irrigation and Agriculture.—The great historic river Nile, Greek Neilos; Latin Nilus; Heb. Yeor or Shihor, Arabic, En-Neel (black), is 3,400 miles in length, the longest in

Africa and one of the great rivers of the world. It divides at lat. $30^{\circ} 15'$, just below Cairo into two main streams, the one entering the sea by the Rosetta mouth on the west, the other by the Damietta mouth on the east. These two streams carry the bulk of the Nile water to the Mediterranean, and inclose a large portion of the territory known as the delta, from its resemblance to the Greek letter Δ and which owes its existence to the deposits of alluvial matter brought down by the stream. The most remarkable phenomenon connected with the Nile is its annual regular increase, arising from the periodical rains which fall within the equatorial regions and the Abyssinian Mountains. As rain rarely falls in Egypt, the prosperity of the country entirely depends on this overflowing of the river. On the subsiding of the water the land is found to be covered with a brown slimy deposit, which so enriches the soil that with a sufficient inundation, it produces two crops a year, while beyond the limits of the inundation there is no cultivation. The Nile begins to rise about the middle of June, and continues to increase until about the end of September, overflowing the low lands along its course, the water being conveyed to the fields by artificial courses where natural channels fail. After remaining stationary for a short time, the river rises again but subsequently begins to subside, showing a markedly lower level in January, February and March, and reaching its lowest in April, May and early June. The overflow water is now to a great extent managed artificially by means of an extensive system of reservoirs and canals, so that after the river subsides it may be used as required. A certain proportion of the fields, after receiving the overflow and being sown, can ripen the crop without further moisture; but many others always require artificial irrigation. Steam pumps are now largely used in northern Egypt. Latterly the government has tried to make the farmers less and less directly dependent on the inundation and the great barrage of the Nile below Cairo, the largest weir in the world, is one means to this end, the great dam or barrage at Assouan being another.

The native methods of raising water for irrigation are chiefly by the *sakieh*, or water wheel, and the *shadouf*. The first consists of a horizontal wheel turned by one or two oxen, which sets in motion a vertical wheel, around which are hung a number of earthen jars, this wheel being sunk into a reservoir connected with the river. The jars thus scoop up the water and bring it to a trough on a level with the top. Into this trough each jar empties itself in succession, and the water is conducted by an inclined channel into the cultivated ground adjoining, which may have been previously divided into compartments of 1 or 2 yards square by raising the mold into walls or ridges of 5 or 6 inches in height. Into these compartments the cultivator forms an entrance for the water, by depressing a little space in the ridge or wall with the sole of his foot; and this overlooking of the channels of irrigation, and adjustment of the openings from one compartment to the other with the foot, is continued till the cultivator is assured by the growth of the plants that each compartment is daily and duly supplied with its proper quantity of water. The second means of raising water, namely, the *shadouf*, consists of a leathern bucket slung at one end of a pole which has a weight at the other,

EGYPT

and sways up and down on a vertical support, a contrivance by which the cultivator is enabled to scoop up the water considerably below his feet, and raise it with comparative ease to the mouth of a channel on a level with his breast. The latter mode of raising water is of great antiquity, and is depicted on the walls of the ancient tombs of Egypt, and also in the sculptures of Nineveh. A sufficient rise of the river (the rise varies at different points) is essential to secure the prosperity of the country; and as the water subsides, the chaplet of buckets on the *sakieh* is lengthened, or several *shādoufs*, rising one above the other on the river bank, are required. Should the Nile rise above the requisite height it may do great damage; on the other hand if it should not attain the ordinary height, there is a deficiency of crops; but with rare exceptions, the inundations are regular and nearly uniform. See DELTA; IRRIGATION; RIVER.

The Nile Barrage.—One of the greatest wonders of modern times, rivalling the Pyramids of the Ancient is the Nile Barrage. Thanks to Lord Cromer and Lord Kitchener, the stupendous work at Assouan and Asyut of taming the Nile, is an accomplished fact. Egypt is no more subject to the caprices of the Nile. The precious fertilizing fluid coming down from equatorial Africa by way of Bahr-el-Ghazal and Bahr-el-Abyad are halted and stored in an immense reservoir. Millions of acres on both sides of the river are reclaimed. Egypt's prosperity always depended upon the Nile. The "seven year famine" recorded in Scripture was the result of insufficient irrigation, and there is an earlier instance of a similar character recorded in hieroglyphics on the rocks of Assouan. After many centuries of inertness and decay Egypt lifts up her head and promises to become again the storehouse of the East.

Oases.—The fertile spots peculiar to the deserts of Africa are found in Egypt along the hollow region of the Libyan Desert, parallel to the general direction of the valley of the Nile, and above 80 miles west of it. The Great Oasis or Wah-el-Khargeh, lies immediately west of the Thebaid, and has a length of 100 miles. About 50 miles west of the northern extremity of this oasis lies the Wah-el-Dakhileh 24 miles long and 10 miles broad. West by south from the Fayoum the date groves of the Little Oasis, or Wah-el-Baharieh, display their unusual verdure. In this fertile spot artesian wells are numerous, and some of ancient construction have been discovered which have a depth exceeding 400 feet. On the road between this oasis and that of El Dakhileh, inclining to the west, occurs half way the Wah-el-Farāfrah of small extent. West of the Fayoum, and about 200 miles from the Nile, lies the oasis of Siwah. The inhabitants of this secluded spot, though tributary to Egypt, are in language and manners wholly Libyan. The region of the oases terminates toward the north in the desert of the Natron lakes. See OASIS.

Zoology.—Owing to the absence of forests in Egypt there are few wild animals, the principal species being the fox, jackal, hyena, the wild ass, the ibex in the Red Sea hills and several kinds of antelope. The chief domestic animals are camels, horses, asses, horned cattle, and sheep. The hippopotamus is no longer found in Egypt, though it is met with in the Nile above the cataracts, and the crocodile is found in

Upper Egypt. Among the birds are three species of vultures (one of which is very large, individuals sometimes measuring eight feet across the wings), eagles, falcons, hawks, buzzards, kites, crows, linnets, larks, sparrows and the beautiful hoopoe, which is regarded with superstitious reverence. Pigeons, quail and various kinds of poultry are very abundant, and numerous aquatic birds, and pelicans. The ostrich is found in the deserts. Among the reptiles are the horned viper (*cerastes*) and the asp (*naja haje*), both poisonous. Fishes abound in the Nile and lakes and furnish a favorite article of food. Waterfowl are plentiful, and were anciently prepared and salted like fish. The sacred ibis is still a regular visitor during the inundation, and the pelican is found in the northern lagoons. Among the countless insects are the sacred beetle, (*Ateuchus sacer*) and the migratory locust. Many of the animals, birds, and reptiles were held sacred by the Ancient Egyptians; whoever killed a sacred animal, an ibis or a hawk, was put to death. If a cat died a natural death every person in the house shaved his eyebrows; if a dog died, the whole body and the head were shaved. The cats were sacred to the goddess Bast and were buried at Bubastis, and the dogs in the vaults of their own cities, field-mice and hawks at Buto, the ibis at Hermopolis, and other animals where they were found lying. Of all animals the sacred bull, Apis, was the most revered. His chief temple was at Memphis. The cow being sacred to Isis, was thrown into the Nile, which was considered sacred; and the Apis bull was buried in the Serapeum near Memphis.

Botany.—The few trees found in Egypt include the date-palm, tamarisk, sycamore, Christ's-thorn, carob, and two species of acacia. Many trees have been planted in recent times, especially about Cairo, such as the lebbek (*Albizzia Lebbeck*) and the eucalyptus. The papyrus plant, once so important, is now to be found only in one or two spots. A paper was manufactured from it, which was supplied to all the ancient world. Boats, baskets, cords, and shoes were also made from it. Wine was abundantly produced in ancient Egypt, and the sculptures bear ample testimony to the extent to which the ancient Egyptians indulged in wine and beer or other intoxicating beverages. The vine is still much cultivated, but little or no wine is made, as it can easily be imported. The following plants are sown immediately after the inundation begins to subside, and are harvested three or four months later: wheat, barley, beans, peas, lentils, vetches, lupins, clover, flax, lettuce, hemp, coriander, poppies, tobacco, watermelons and cucumbers. The following plants are raised in summer chiefly by means of artificial irrigation: durra, maize, onions, henna, sugar-cane, cotton, coffee, indigo, and madder. Several varieties of dates, and grapes are the most common, but other fruits such as figs, pomegranates, apricots, peaches, oranges, lemons, citrons, bananas, mulberries and olives are plentiful. The lotus or water-lily is the chief species of flower found in Egypt. There is a high coarse grass called *halfa* and various kinds of reed and canes.

Geology and Mineralogy.—Granite, eocene limestone and sandstone are the principal rock formations found in Egypt. But in the Nile Valley from 25° N. L. to the Fayoum, sandstone predominates. At Syene, the southern extremity of Egypt proper, granite predominates. Its

EGYPT

quarries have supplied the materials for the obelisks and many colossal statues of Ancient Egypt. A great extent of the country is covered with moving sands; the soil bordering the Nile, owing to the encroachment of the shifting sands of the desert, consists of an argillaceous earth or loam, more or less mixed with sand. This sedimentary deposit shows no trace of stratification. In addition to those already mentioned, there are various other minerals, which were employed in architecture, sculpture, etc. These include syenite, basalt, alabaster, breccia, and porphyry. Among other valuable products of Ancient Egypt were emeralds, gold from the mines in Upper Egypt, iron from the desert plains of Nubia, and natron from the lakes in the Oasis of Ammon (hence name Ammonia, Latin *sal-ammoniacum*). Bitumen, salt, and sulphur are also among the minerals of Egypt.

Inhabitants.—The peasant class, or Fellahin, are the most numerous and are indigenous. They are to a certain extent descendants of the Ancient Egyptians, but they have been subjected to crossings and have embraced Mohammedanism. Next in number are the Copts, the descendants of the ancient Egyptians who embraced and still cling to the Christian religion. (See Copts). Though comparatively few in number (about 600,000), their education and useful talents enable them to hold a respectable position in society, filling the posts of clerks, accountants, etc. With these aboriginal inhabitants are mingled in various proportions, Turks, Arabs (partly Bedouins), Armenians, Berbers, negroes, and a considerable number of Jews, Greeks, and other Europeans. The Turks hold many of the principal offices under the government. The great bulk of the people are Mohammedans, the Christians being only about 7.5 per cent. The Egyptians in the mass are quite illiterate, but under the supervision of the ministry of public instruction progress is being made. In 1902 there were about 10,000 schools with 228,000 pupils. The language in general use is Arabic.

The Fellahin, the most superior type of the Egyptian, are a fine race, handsome, of excellent physique, and courteous in their manners. In northern Egypt they are of a yellowish complexion, growing darker toward the south, until the hue becomes a deep bronze. Mr. Lane, the best authority upon the subject, speaks highly of their mental capacity, and gives them credit for uncommon quickness of apprehension and readiness of wit. They are highly religious, and are generally honest, cheerful, humane, and hospitable. But these are exceptions in a mixed population of Bedouins, negroes, Abyssinians, Turks, Syrians, Greeks, Armenians, Jews, and Europeans. Judging from the language and the physical condition of the mummies of Ancient Egypt, the population must have been of mixed origin, part Asiatic and part Nigritic; and there seems also to have been an aboriginal race of copper color, with rather thin legs, large feet, high cheek-bones, and large lips; both types are represented on the monuments. The statements of Greek writers that a system of castes prevailed in Egypt are erroneous. What they took for castes were really conditions of society, and the different classes not only intermarried, but even, as in the case of priests and soldiers, held both employments. As in all bureaucracies, the sons often obtained the same employments as their fathers.

Government.—The ancient government of Egypt was a monarchy, limited by strict laws and by the influence of powerful hereditary privileged classes of priests and soldiers. The priests were the ruling class. They were restricted to a single wife, and if polygamy was permitted to the rest of the people, it must have been very seldom practised. The marriage of brothers and sisters was permitted. The laws were wise and equitable, and appear to have been rigidly enforced. Murder was punished with death, adultery by bastinadoing the man and by cutting off the nose of the woman, forgery by cutting off the culprit's hands. Imprisonment for debt was not permitted, but a man could pledge to his creditors the mummies of his ancestors, and if he failed in his lifetime to redeem them, he was himself deprived of burial. Women were treated with respect, and the laws and customs seem to have been so favorable to them that their condition in Egypt was much higher than in any other nation of antiquity. The military force of Egypt was a species of hereditary militia, which formed one of the leading classes of society, and in time of peace cultivated the land, of which it held a large portion. The king's guards, some few thousands in number, were the only standing army. The number of soldiers in the military class is stated by Herodotus at 410,000, which probably included all the men of that class able to bear arms. It is improbable that the whole of them ever were or could have been brought into the field at once. Their arms were spears and swords, and they were protected by large shields.

At the present day the government is in the hands of the viceroy or khedive, as supreme ruler, who pays an annual tribute of about \$3,000,000 to Turkey, and is assisted by a ministry formed on the model of those of western Europe. The government is carried on under the supervision of Great Britain. After the defeat of Arabi Pasha in 1882 the authority of the khedive was restored by British troops. The British have initiated various reforms in the administration, such as the establishment of new native tribunals. The administration of justice is somewhat complicated. There are besides native tribunals, consular courts, mixed tribunals, and religious courts. The financial condition of Egypt is being slowly improved under British management. The Egyptian army is under the command of an English general, and officered partly by Englishmen and partly by Egyptians: its total strength is 18,100, while the English army of occupation, which, since the rebellion of 1882, has remained in Egypt, has a strength of 5,600.

Commerce and Industry.—Agriculture, manufacture and trade were carried on in Egypt in the very earliest days. Upon the ancient monuments we find representations of the mechanical arts, where we see the blow-pipe, bellows, siphons, press, balance, lever, saw, adze, chisel, forceps, syringe, harpoon, razors; we have also glazed pottery, the potter's wheel, and the kiln; and dated specimens of glass of the time of (Thothmes III. 1445 B.C.). Gold-beating, damascening, engraving, casting, inlaying, enameling, wire drawing, and other processes were practised. Weapons and other instruments of war, shields, cuirasses of quilted leather, helmets, spears, clubs, maces, daggers, bows, battle-axes,

EGYPT

pole-axes, hatchets, and falchions are shown. The testudo, ladders, torches, and lanterns were also in use. In agriculture the plow, hoe, sickle, and other implements were employed. The processes of growing and preparing flax, and making it into thread, string, ropes, and cloth, as well as the looms employed, are all depicted. Mats and baskets were beautifully made, either of the halfa grass or palm leaves, or of the outer rind of the papyrus plant, which was used in making paper. Coffins or wooden sarcophagi were chiefly of sycamore or cedar, covered with stucco and richly painted. The ordinary boats of the Nile were of planks of the acacia, and had two rudders or large oars, with a sail of cloth frequently painted or worked in colored patterns. Many of the vessels of burden were of great size. The boats made of papyrus were mostly punts for fishing, or for gliding through the canals of the Delta. Implements for painting, ladles, bells, crucibles, and surgical instruments have also been found. The commerce of the Egyptians with neighboring nations enriched the country with slaves, cattle, gems, metals, rare animals, and objects of curiosity. The Egyptians expended enormous wealth on the tombs and furniture of the dead, and the paintings acquaint us fully with the various ceremonies followed. In embalming they excelled.

To-day the one branch of industry for which Egypt is peculiarly adapted by nature is agriculture, and large quantities of cereals, cotton, and other agricultural produce are raised; yet, generally speaking, agriculture is still in a very low state, the necessary consequence of the wretched condition and extreme poverty of those engaged in it. The Egyptians still adhere to their ancient custom of uniting the followers of each business or profession into a guild, governed by their sheikh, who acts, if need be, as their representative. These guilds are exceedingly numerous, as might be expected among a people whose social organization dates from a remote antiquity.

Among the crops which the Egyptians grow with success, cotton is the most popular and profitable. (See *COTTON*.) The cotton plant of Egypt differs materially, in one respect at least, from that of other countries. In America it has been found unprofitable to allow the plants to continue in the ground longer than one year. In Egypt, however, the case is different, for the cotton plant yields five, and sometimes six, consecutive crops before replanting is found to be necessary. This being the case, a cotton field once planted is a secure investment for at least five years, and as peasants of the Nile do not love labor, more cotton is grown in Egypt in proportion to the population engaged in agriculture than in any other part of the world. In both Upper and Lower Egypt cotton is therefore the standard crop, and as it is not troubled with worms as in America, and by the method of irrigation the farmer can give it exactly the right portion of moisture and no more, the crop is tolerably reliable. The boats transport the product to Cairo or to Alexandria, the leading cotton markets. The exchange in the former city is located on one of the principal streets, while the market proper is in a public square opposite the great Mosque of Hassan. The time of the river journey to Alexandria is from six

days to six months, but, as the Mohammedans say, "God is great, and there is no hurry."

The business of tanning is also one of the industries in which the Egyptians perfectly succeed, by a process peculiar to themselves. They make excellent morocco leather, which is goat-skin dressed and dyed in a particular manner. The pottery of Egypt also deserves a word of praise, chiefly for the merit of the bardaks or water-jars. Coarse cotton cloths, and cloths of mixed cotton and wool, are largely made in the country; silk is cultivated to some extent; and the cultivation of the sugar-cane received a great impulse from the viceroy, Ismail, who, at a great expense, erected a number of mills. Goods carried by the Suez Canal do not form part of the commerce of the country, and the transit trade proper is of little importance. The exports of Egypt for 1902 amounted to £19,451,460 and the imports £16,649,145. The public debt (1901) amounts to £103,264,540. The railway system, under government control, embraces 2,173 miles and nearly 2,877 miles of telegraph lines.

Education.—The chief seat of Koranic education is the famous University of El Azhar, founded by Saladin about 1170, and still employing the same methods of instruction that were originally in use. The faculty numbers about 350 moulahs or priests, many having wide reputation for scholarship; the students, some 10,000 or 12,000, are from India, Turkey, Syria, Afghanistan, and other Mohammedan countries. There is no regular university organization, nor arrangement for the endowment of departments or founding of chairs. Anyone who can collect a class is allowed to lecture. Frequently the professors practice law, hold clerkships, or are connected with mosques in Cairo. There is no charge for instruction. Three fourths of the students study theology, though other "ologies" and geography, philosophy, and astronomy are also taught. There are also in Cairo eight colleges and professional schools of excellent grade. The Egyptian ministry of public instruction has under its direction schools for engineering, medicine, law, and agriculture, two technical schools, and two normal training schools for teachers. A military school is under the management of the war office. In addition to the schools under the direction of the ministry of public instruction are 868 other schools under the inspection of the ministry, with 1,364 teachers and 26,831 pupils. The 'Statesman's Year-Book' for 1903 gives a total of about 10,000 schools with 17,000 teachers and 228,000 pupils. There are 187 schools attached to Protestant and Roman Catholic missions, and 43 European private schools. In 1897 the literate native population amounted to but 5.8 per cent.

Justice.—The administration of Egyptian justice is extremely complicated. There are four classes of courts: (1) The *mehkemehs*, or Mohammedan courts, conducted according to the precepts of the Koran and the principles of the Mohammedan religion, and retaining jurisdiction in matters of personal law only. (2) The so called native tribunals, composed of 46 summary tribunals, 7 central tribunals, and a court of appeals at Cairo. These deal with crimes committed by natives and civil actions between natives. (3) The consular courts, which deal with civil cases between foreigners of the same nationality, and also try criminal cases in which

EGYPT

the accused are foreigners, not within the jurisdiction of the mixed tribunals. (4) The mixed tribunals, dating from 1876, which have jurisdiction in all matters civil and commercial between natives and foreigners, or between foreigners of different nationalities. These courts are admittedly successful. A code of laws has been published for the greater systemization of native jurisprudence.

Railways, Telegraphs, and the Post-Office.—On 1 Jan. 1902 there were 2,173 miles of railway, 1,393 miles belonging to the state and 780 to private companies. The private roads are largely narrow-gauge spurs or feeders connecting the sugar-mills and other manufacturing establishments with the public lines. Two thirds of the tracks are in Lower Egypt. The above figures were exclusive of the Cairo suburban line, 16 miles in length, to Helwan, and the Sudan military railway to Khartum. The "Cape to Cairo" line is being gradually extended. At the close of 1902 the telegraphs belonging to the Egyptian government had a total length of 2,877 miles, the length of the wires being 10,874 miles. By concessions, the Eastern Telegraph Company has lines across Egypt from Port Said to Suez and from Alexandria (via Cairo) to Suez. There were 340 post-offices in the towns of Egypt, 254 travelling offices, and 408 localities where rural post had been established.

History.—The history of Egypt, prior to the beginning of the ancient empire 4000 B.C., is entirely mythical. The history divides itself into six great periods: (1) The Pharaohs or native kings; (2) the Persians; (3) the Ptolemies; (4) the Romans; (5) the Arabs; (6) the Turks.

The Pharaohs.—The main sources of its history under the Pharaohs are the Scriptures, the Greek writers Herodotus, Diodorus, and Eratosthenes, fragments of the writings of Manetho (an Egyptian priest in the 3rd century B.C.) From the Scriptures we learn that the Hebrew patriarch Abraham went into Egypt because of a famine that prevailed in Canaan. He found the country ruled by a Pharaoh, Egyptian, *per āa*, meaning "Great house," the Egyptian term for king. The date of Abraham's visit, according to the chronology of the Hebrew text of the Bible, was 1920 B.C.; according to the Septuagint, 2551; while Bunsen fixed it at 2876. Nearly two centuries later Joseph, a descendant of Abraham, was sold into Egypt as a slave to Potiphar, the captain of the guards of another Pharaoh, whose prime minister or grand vizier the young Hebrew eventually became. Joseph's father, Jacob, and his family, to the number of 70, accompanied, as Bunsen conjectures, by 1,000 or 2,000 dependents, followed their fortunate kinsman into Egypt, where they settled in a district called the land of Goshen. There they remained until their numbers had multiplied into two or three millions, when under the lead of Moses they revolted and quitted Egypt to conquer Canaan.

Ptolemaic Period.—When Alexander's army occupied Memphis the numerous Greeks who had settled in Lower Egypt found themselves the ruling class. Egypt became at once a Greek kingdom, and Alexander showed his wisdom in the regulations by which he guarded the prejudices and religion of the Egyptians. He founded Alexandria as the Greek capital, which became the emporium of commerce and centre of learning for several centuries. Ptolemy I. was suc-

ceeded by Ptolemy II., Philadelphus. He was successful in his external wars, built the Museum, founded the famous library of Alexandria, purchased the most valuable manuscripts, engaged the most celebrated professors, and had ordered seventy Hebrew sages to translate the Hebrew Scriptures into the Greek language, hence known as the Septuagint, and the Egyptian history to be written by Manetho. His successor Ptolemy III., Euergetes, pushed the southern limits of his empire to Axum. Ptolemy IV., Philopator (221–204 B.C.) warred with Antiochus, persecuted the Jews, and encouraged learning. Ptolemy V., Epiphanes (204–180 B.C.) experienced repeated rebellions, and was succeeded by Ptolemy VII., Philometor (180–145 B.C.) and Euergetes (145–116 B.C.) by Ptolemy X., Soter II. and Cleopatra, till 106 B.C. and by Ptolemy XI., Alexander I. (87 B.C.) under whom Thebes rebelled; then by Cleopatra, Berenice, Ptolemy XII., Alexander II. (80 B.C.), and Ptolemy XIII., Neos Dionysius (51 B.C.), and finally by the celebrated Cleopatra. After the battle of Actium (31 B.C.) Egypt passed into the condition of a province of Rome, governed always by a Roman governor of the equestrian, not senatorial, rank.

The Egyptians have continued building temples and covering them with hieroglyphic inscriptions as of old; but on the spread of Christianity the older religions lost their sway. Then the Christian catechetical school, arose in Alexandria, which produced Clemens and Origen. Monasteries were built all over Egypt; Christian monks took the place of the pagan hermits, and the Bible was translated into Coptic.

On the division of the great Roman empire (337 A.D.), in the time of Theodosius, into the Western and Eastern empires, Egypt became a province of the latter, and sank deeper and deeper in barbarism and weakness. It then became the prey of the Saracens, 'Amribu-el asr, their general, under the Caliph Omar, taking Alexandria, the capital, by assault. This happened 641 A.D., when Heraclius was the emperor of the East. As a province of the caliphs, it was under the government of the celebrated Abbassides—'Harun er-Rashid and Al-Mamon and that of the famous Sultan Saladin. The last dynasty was, however, overthrown by the Mamelukes (1240), and under those formidable despots the last shadow of former greatness and civilization disappeared. Selim, Sultan of the Turks, eventually (1516–17) conquered the last Mameluke sultan, and Egypt became a Turkish province, governed by a pasha. After this it was the theatre of internal wars by the Mameluke boys against the Turkish dominion, which was several times nearly extinguished. Confusion and civil war between the different factions of the Mamelukes continued to prevail till 1798, when the French invasion under Napoleon Bonaparte united their chiefs in self-defense; but the Mameluke army was all but annihilated in the battle of the Pyramids. The French then conquered the whole of Egypt and held it till 1801, when they were driven out by the British under Abercromby and Hutchinson.

On the expulsion of the French the Ottoman Porte effectually urged its claim to sovereignty, and the accession of the Albanian soldier, Mohammed 'Ali to the pashalic in 1805, imparted a galvanic prosperity to Egypt, by the merciless destruction of the turbulent Mamelukes (whom a disastrous British expedition in 1807 vainly

EGYPT

sought to restore), the formation of a regular army, the increase of security, the improvement of the irrigation, and the introduction of the elements of European civilization. In 1816 Mohammed 'Ali reduced part of Arabia, brought it under his sway by the generalship of his son, Ibrahim; in 1820 he annexed Nubia and part of the Sudan, and from 1821 to 1828 his troops, under Ibrahim, occupied various points in the Morea and Crete, to aid the Turks in their war with the insurgent Greeks. The Egyptian fleet was annihilated at Navarino, and Ibrahim remained in the Morea till forced to evacuate by the French army, under Maison, in 1828. In 1831 Ibrahim began the conquest of Syria, and in the following year totally routed the Ottoman army at Koniya, after which the Porte ceded Syria to Mohammed 'Ali on condition of tribute. War breaking out again, the victory of Nisib in 1839 would perhaps have elevated him to the throne of Constantinople; but the quadruple alliance in 1840, the fall of St. Jean d'Acre to the British, and the consequent evacuation of Syria, compelled him to limit his ambition to the pashalic of Egypt. In 1848 Mohammed 'Ali became imbecile (he died in 1849), and his son Ibrahim sat on his throne for two months, when he died, and 'Abbās Pasha, Mohammed Ali's grandson, succeeded him, and was superseded in turn (1854) by Sa'id Pasha, youngest son of Mohammed 'Ali. M. de Lesseps then obtained the co-operation, hitherto withheld, of the Egyptian government in his scheme of the Suez Canal, which was opened in 1869. Sa'id was succeeded (1863) by his nephew, Ismail, son of Ibrahim, who, by a firman purchased from the Sultan, (1866) the hereditary title of Khedive. He obtained the hereditary title of Khedive to the throne of Egypt, direct from father to son, instead of descending, according to Turkish law, to the eldest male of the family, and in 1872 the Sultan granted to the Khedive the rights (withdrawn in 1879) of concluding treaties and of maintaining an army, and virtually gave him sovereign powers. Thus secure on an hereditary throne, Ismail began a series of vast internal reforms, built roads, bridges, lighthouses, railways, and telegraphs, reconstructed the postal service, improved the harbors at Suez, Port Sa'id, and Alexandria, supported education, and introduced mixed courts of law. Extending his dominions southward, he annexed Dar-Fur in 1874, and in that and the following year further conquests were made. The condition of the finances led to the establishment of "dual control" by Great Britain and France, and in 1879 Ismail was forced to abdicate under pressure of the British and French governments, and was replaced by his son, Tewfik. His position was soon threatened by the so-called National party with Arabi Pasha at its head, who aimed at his deposition and at the abolition of European intervention. In May 1882, a rising took place in Alexandria, when many Europeans were killed and their houses pillaged. The Khedive fled from Cairo, where Arabi remained autocrat. The French refusing to interfere, Great Britain determined to act, and on 11 July a British fleet bombarded the forts at Alexandria, causing the rebels to retreat. In August a force under Sir Garnet (afterward Lord) Wolseley landed at Ismailia, and on 13 September Arabi's forces were totally defeated at Tel-el-Kebir, and the rebellion crushed. Arabi and his associates being banished.

Before this a rebellion against Egyptian rule had broken out in the Sudan under the leadership of Mohammed Ahmed, who professed to be the Mahdi or divinely-sent Mohammedan conqueror. His followers soon became numerous, defeated Egyptian troops that opposed them, and threatened the existence of all the Egyptian garrisons in the Sudan. In 1883 they annihilated an Egyptian force under Hicks Pasha near El Obeid in Kordofan, and in 1884, Osman Digna, as representing the Mahdi, defeated another force under Baker Pasha near Suakim. British troops were now despatched to Suakim, and at El Teb and Tamai severe defeats were inflicted on the Arabs by Gen. Graham. Meantime Gen. Gordon had been sent to Khartum to withdraw the garrisons from the Sudan, but he was shut up in the town for nearly a year, and perished before the relief expedition under Sir Garnet Wolseley could reach him (January 1885). The Sudan was then given up, and the southern boundary of the Egyptian dominions fixed at Wady Halfa.

In 1892 Tewfik died, and was succeeded by his son, Abbas Hilmi, who is the seventh viceroy and third khedive of Egypt. In 1896 an Anglo-Egyptian expedition for the reconquest of the lost provinces was despatched under Sir Herbert (now Lord) Kitchener. Dongola was soon occupied. Abu Hamed was captured in the following year, and (8 April 1898), the insurgents were defeated in a battle near the confluence of the Atbara. Finally (2 Sept. 1898) the forces of the Khalifa, as the Mahdi's successor was called, were defeated with great slaughter at Omdurman, near Khartum. The territory thus reconquered was placed under a governor-general, and was rapidly organized. A subsequent attempt of France to occupy Fashoda and enforce a claim to the Bahr-el-Ghazal "Blue River" valley led to some friction with Great Britain. Religion.—The ancient Egyptian religion was a philosophical pantheism, the various attributes of the Deity being divided among the different gods of the Pantheon. Unlike the Greek, where a god was honored in a separate temple, each Egyptian divinity was accompanied by a *paut*, or "company" of companion-gods. The principal nomes and cities had each a family group of gods, consisting of a parent deity, a wife and sister, and a son. Thus Ptah or Hephaistos, the eponymous and principal god of Memphis, formed a triad with the goddess Sekhet or Bast, and I-em-hetep; at Thebes the triad was Amen-ra, Mut, and Khons; and at Apollinopolis Magna, Har-bahud (Horus), Hathor, and Har-pakhrut (Harpocrates). These triads were usually, if not always, accompanied by inferior deities completing the *paut*; and personifications of the elements, passions, and senses were introduced. The worship of some triads, however, became universal—that of Osiris, Isis, and Horus being found all over Egypt at the earliest period. The gods, indeed, are stated by the Greeks to have been divided into three or more orders or systems. The gods of the Memphite order were Ptah, Ra, Shu, Seb, Osiris, Set, or Typhon, and Horus; and Amen, Mentu, Atmu, Shu, Seb, Osiris, Set, Horus, and Sebeq, according to the Theban system. Difficulties arise

EGYPT

from the tendency to fuse different gods into one, particularly at a later period; Amen-ra, for example, being identified with Horus; and Horus, Ra, Khnum, Mentu, and Tum being merely considered the sun at different periods of his diurnal course.

A few foreign deities became at the close of the 18th dynasty engrafted upon the religious system—as *Bar*, Baal; *Ashtarata*, Ashtaroth; *Anta*, Anaitis; *Ken*, Kiun; *Reshpu*, Reseph; *Sei*, or Sutekh, sometimes identified with Baal. All the gods had human passions and affections, and their mode of action was material; they walked on earth, or sailed through ethereal space in boats. First among the deities comes Ptah, the opener, represented as the creator of the world, the sun, and moon, out of chaos (*ha*) or matter, to whom belong Sekhet, “the lioness,” and Bast, Bubastis, lion-headed goddesses presiding over fire, and Nefer-Tum, his son, a god wearing a lotus on his head. Next in the cosmic order is Khnum—worshipped at Elephantine—the ram-headed god of the liquid element, who also created the matter of which the gods were made; and connected with him are the goddesses Heka the Frog, or “primeval formation,” Sati, or “sunbeam,” and Anuka, alluding to the genesis of the cosmos. The Theban triad comprised Amen-ra, “the hidden” power of the “sun,” the Jupiter; *Mut*, the “Mother” goddess of “Matter,” the Juno; *Nit*, the “Shuttle,” the Minerva; and *Khons*, “Force” is Hercules, a lunar type. A subordinate type of Ammon is Khem or Amsu, “the enshrined,” who, as *Harnckht*, or Powerful Horus, unites beginning and end, or cause and effect.

A great variety of abstract principles and even animals and vegetables were, however, worshipped by the multitude, though the doctrine of one God was privately taught by the priests to a select few. To each deity an animal seems to have been held sacred, which was probably regarded as his symbolical representative. Bulls were consecrated to Osiris and cows to Hathor; the sacred bull of Memphis, called Apis, being particularly venerated throughout Egypt. A hawk was the symbol of Horus or Ra, the ibis of Thoth, the crocodile of Sebeq, and the cat of Bast. Of the doctrines of the Egyptian religion little is accurately known. The existence of the spirit after death was believed, and a future state of rewards and punishments inculcated, in which the good dwelt with the gods, while the wicked were consigned to fiery torments amid perpetual darkness. It was believed that after the lapse of ages the spirit would return to the body, which was therefore carefully embalmed.

At the present day about nine tenths of the people in Egypt profess the Sunnite (Mohammedan) faith. About 750,000 are Christians and 25,000 are Hebrews. The Roman Catholics have two churches in Alexandria and two in Cairo. The Armenians also have a church and a bishop at Cairo. There is an American mission in both cities, but the natives are bigoted and exclusive and are not well disposed toward religious beliefs other than their own. See *BOOK OF THE DEAD*; *EMBALMING*; *MOHAMMEDANISM*; *IDOLATRY*; *PANTHEISM*.

Literature.—See *EGYPTIAN LITERATURE*.

Ancient Architecture.—The monuments and traces of a past civilization found in Egypt are of two periods,—those built in the times of the

Pharaohs, and those built during the sway of the Greek and Roman rulers of the country. Although the temples of the two periods differ considerably in plan and in other particulars, there is yet sound reason for believing that those built under the Greeks and Romans were constructed after designs, as they certainly occupy the sites of Pharaonic temples still more ancient than any now existing; that they were, in fact, mere restorations of temples built by the earlier Pharaohs.

The leading features of the now existing temples of the time of the Pharaohs are these: First, a gateway or pylon, flanked by two truncated pyramids. These occupy the entire width of the building, and form the entrance to a square court, surrounded by a portico supported by a double or single row of columns. Crossing this court the visitor passes through a second pylon into the inner court, which was likewise surrounded by a portico supported either by columns or by piers, against which were figures of the king. Beyond this second court it would appear the public were not admitted, for the spaces between the front row of columns or piers facing the gateway are occupied by a dwarf wall, which effectually barred entrance excepting at either one or three points where there were gates. This inner court led immediately into the largest chamber of the temple, called the Hall of Columns, the roof of which was always supported by columns representing a grove of papyrus. The centre avenue was higher than the rest of the hall, and consisted usually of 12 columns, the capitals being imitated from the full-blown expanded papyrus, while the columns which sustained the lower roof were in the form of a bud of the same plant. To the Hall of Columns succeeded a series of smaller chambers, the roofs of which were generally supported by six or four columns, imitating the bud of the papyrus, either as a single plant or as several bound together; or else by square piers, or columns with 8, 12, or 16 faces. These apartments frequently surrounded a dark chamber—the most sacred in the temple—the holy of holies. Whether the roof of the portico which surrounded the court was supported by piers or columns, the structural arrangements were always precisely the same. There was first the pier or column, ordinarily made of several pieces of stone solidly united by mortar and wooden cramps; then came the architrave or frieze, of one block, stretching from column to column; and lastly, the blocks forming the cornice, concealing the ends of the roof stones which rested upon the architrave. The bulk of the column, in proportion to the weight it had to sustain, was extremely ample; and the pressure being always perpendicular, these ancient structures have come down to us with their roofs sound, while arched buildings of much less antiquity have been entirely ruined by the lateral pressure which that mode of construction exerts on the walls. The Egyptian gate was peculiarly simple. The lintel was always of one stone, and the door-posts also were very frequently of only one block, while each of the three portions had its appropriate decoration. Above the entrance was sculptured the winged globe or protecting divinity of entrances, with the names of the divinities to whom the temple was dedicated, and of the Pharaoh who built it. The door-posts also bore the name and title of the builder. The surface

TOMB IN THE VALLEY OF EL ASSASSIF. THEBES, EGYPT

EGYPT

of each architectural feature was engraved with its particular ornament appropriately colored.

The temples built during the reigns of the Greek and Roman rulers may be thus described. First, the propylon, with its truncated pyramidal towers, which were sometimes adorned with narrow flags on tall poles; then a court surrounded on three sides with a colonnade. At the extremity of the court, and facing the gateway, was an elevated portico of six columns in line, and three or four deep. The uninitiated obviously were not permitted to enter beyond the court, for the columns of the first row of the portico are invariably joined by a dwarf wall, the only opening being between the centre intercolumniation, to which were attached the valves of the gate. To the portico succeeded a series of small chambers, the roofs of which were supported by four or by two columns. The centre chambers were lighted by small square openings in the roof, and those at the side by small openings in the walls: but in no example is there that kind of clerestory perforated with large openings, that occurs in the Hall of Columns of the Pharaonic temples. Besides the foregoing characteristics, there is an elaborate form of capital, representing the papyrus in three stages of growth, in one capital, or sometimes a collection of lotus flowers, or the full-blown papyrus alone: but in no instance do we find the pier with the attached figure, nor the single bud of the papyrus, nor that form of column which represents several buds of the plant joined together. The palm-tree capital, however, belongs to both periods.

Among the most remarkable structures erected by the ancient Egyptians are the great pyramids, erected to serve both as monuments and as tombs. Strong buildings (Mastabas) containing one or more rooms were also erected as tombs, in which food and other articles were deposited for the use of the dead, the inner walls being embellished with inscriptions and representations; statues of the dead being also placed in the interior. Tombs cut in the rock were also common. In connection with architecture should be mentioned the obelisks, the oldest known being erected by Userthesen I. Sphinxes, often forming avenues, were a common accessory of temples, the greatest being that known as the Sphinx, a colossal companion of the pyramids of Gizeh. See ARCHITECTURE; OBELISK; PYRAMIDS; SPHINX.

Ancient Sculpture.—In portrait sculpture the Egyptians attained extraordinary perfection at an early date, the skill with which they worked in hard stone, such as diorite and basalt, being surprising. Some of the early statues are of colossal size, but a higher style of art is shown in those of ordinary size, though a certain conventional treatment is always apparent. The most usual kind of mural sculpture, a kind peculiar to the Egyptians, is that known as hollow or sunk relief (*cavo-rilievo*). The general outline of the object intended to be represented is cut into the smooth surface of the stone, while at the same time the minor forms and rotundity are represented within the incised outline. By this contrivance the details of the sculptures are protected. Sometimes the outline is excessively deep, at others the surface of the figures is altogether much lower than the general surface of the wall, and in others the outline is but slightly incised with a corresponding flatness within.

Wherever the Egyptians practised the true bas-relief the sculpture is almost invariably in very low relief. The back view of the human figure is never represented in the sculptures excepting in the case of an enemy, and then rarely; the figure is generally represented in profile, and there are but few attempts at delineating the front view of the foot or of the face; however, whether the face be represented in front or side view, a profile eye is never found. The figures of the king in battle-pieces, and of the landed proprietor in domestic scenes, are always on a much larger scale than the other actors in the piece. Statues and reliefs were always painted, and when wall painting is employed it is always as a substitute for sculpture. There is no proper perspective, and certain conventionalities of color are employed. The Egyptians are represented with red and yellow complexions, red ochre for the men and yellow for the women. The hair of the king is frequently painted blue, but that of ordinary men black. In representing the various nations with whom Egypt had intercourse, the artists seem to have endeavored to imitate the complexions peculiar to each. Ammen-Ra, the chief divinity of Thebes, is always painted blue, and he is further distinguished by two high feathers which he wears in his cap. The inferior divinities are not uncommonly of the complexions of mortals. The sky or heavens are invariably indicated by a strip of blue coming downward at the lower side of each extremity, and occasionally having upon it a row of five-pointed stars. Water, seas, and rivers are represented by zigzag lines of a blue or green color. Mountains have a yellow color, with red spots upon it. Egyptian art was at its highest during the period between the fourth and sixth dynasties, and notwithstanding its defects it was superior to that of Nineveh and Babylon. See ART; SCULPTURE.

Archæology.—The attention of the world was drawn to Egypt as a rich field for scientific exploration in the early part of the 19th century. In 1799, M. Boussard, one of Bonaparte's captains, found a large block of black granite in the trenches of Fort Julien near Rosetta; hence the name Rosetta Stone. On this were the remains of three inscriptions in hieroglyphic, demotic, and Greek characters. The stone was given to the British Museum by George III.

The French savant, Emanuel de Rougé, was the first to translate whole Egyptian texts and inscriptions. His influence was felt in France by such men as Mariette, Chabas, Deveria, Pierret, Maspero, and Revillout, the great demotic scholar of France, also by Birch, Le Page-Renouf in England. The practical archaeologists of the German school, notably Lepsius, Bunsen, and Brugsch, translated the texts of the Egyptian temples in their relation to history and religion. Ebers introduced his scientific researches in novels. The German Egyptologists mostly devoted themselves to philology, while the French school has made history and archaeology its special study since Emanuel de Rougé's death. To Auguste Mariette (Mariette Bey) is due the discovery of the Serapeum of Memphis. He cleared the temples of Edfu, Karnak, Denderah and Abydos. He explored the Nile valley from Tanis to Napata, and his collections of antiquities were removed in 1889 from Boulak to Gizeh.

After Mariette the work of excavation was

EGYPT

carried on by Maspero, Grebaut, De Morgan, and others, the first of whom resumed his post as director-general of antiquities in 1899. There is an archaeological mission in Cairo, founded in 1880 by Maspero, who placed at its head successively Lefebvre, Grebaut, and Boutriat. Students go every year to Egypt to excavate. The Egyptian Research Account, under Petrie, trains students as explorers. The Egyptian Exploration Fund was founded in 1883 by Sir Erasmus Wilson, Prof. R. Stuart Poole, and Miss Amelia B. Edwards, and its American branch, at the close of that year, by the Rev. Dr. William C. Winslow of Boston. In 1883, Edouard Naville of Geneva, Switzerland, cleared the site of ancient Pithom, near the island of Goshen. The work of Naville, Griffith, Gardner, and Newberry resulted in important discoveries at Neucratis, Tanis, Bubastis, Denderah, Deir-el-Bahari, Tel-el-Amarna, etc. See EXPLORATION; NUMISMATICS, etc.

Recent Discoveries.—The last few years have seen wonderful discoveries in Egypt, for the tombs of the kings of Abydos have been opened and the treasures which have been found bring us face to face with archaic history. Among the remarkable finds were a carved slate slab showing King Nâr-mer smiting his enemy, an ebony table, a bar of gold, gold jewelry, including bracelets, and a royal sceptre. The oldest group of jewelry in the world is undoubtedly the four bracelets of the queen of King Zer or Ieta (4366 B.C.), which was discovered with a portion of the mummy in a hole in a wall. This is 1500 years earlier than any other jewelry thus far identified. The bracelets show a wonderful perfection in the soldering of the gold. They also show the turning point in the development of Egyptian art; the finest bracelets are formed of alternate plaques of gold and turquoise, each surmounted with a royal hawk. The turquoise hawks are clumsy, of a more archaic form than those on the gold pieces.

An American archæologist, Theodore M. Davies, has made one of the most interesting discoveries of recent years in excavating the tomb of Thothmes IV. of the 18th dynasty. The tomb contained the chariot in which he rode at Thebes. Like other royal tombs it consisted of a gallery cut in the heart of the mountain. After sloping downward for a considerable distance it is interrupted by a deep square well; on one of the walls is a band of paintings. On the farther side of the wall the passage turns back, and finally opens into a large chamber, at the extreme end of which is a magnificent sarcophagus of granite covered with texts from "The Book of the Dead." On either side are smaller chambers; the floor of one of them was covered with the offerings made to the dead king, consisting of mummified loins of beef, legs of mutton, and trussed ducks and geese. Clay seals with the name of the Pharaoh had been attached to the doors of the chambers, and it is stated the raised portions of the seals having been smeared with blue ink before being pressed on the clay. A great many of the objects in the tomb of Thothmes were found to be broken, and this was explained by a hieroglyphic inscription on one of the paintings which adorn the walls of the vestibule to the chamber in which the sarcophagus was found. That inscription states that the tomb was plundered by robbers, but that it had been restored as far as possible to its

original condition by Hor-em-heb, the reigning Pharaoh. The floor was covered with vases, dishes, symbols of life, and other objects in blue faience. Unfortunately, nearly all of them had been wantonly broken, though in some cases the breakage had been repaired in the time of Hor-em-heb. Equally interesting is a piece of textile fabric into which hieroglyphic characters of different colors have been woven with such wonderful skill as to present the appearance of painting on linen. The chariot is one of the finest specimens of art that have come down to us from antiquity. Along with the chariot was found the leather gauntlet with which the king protected his hand and wrist when using the bow or reins.

Recent excavations at Abydos have brought to light the royal tomb of Menes, of the first dynasty, in which was found a large globular vase of green glaze, with Menes' name inlaid in purple. Thus polychrome glazing is taken back thousands of years before it was previously known to exist. There are also several pieces of delicately carved ivory of that age. One represents the figure of an aged king, which, for subtlety of character, stands in the first rank of such work, and ranks with the finest work of Greece and Italy. A camel's head modeled in pottery takes back its relation to Egypt some 4,000 years. Hitherto no trace of the camel appeared before Greek times. The ivory carving of a bear also extends the fauna of early Egypt.

SAMUEL AUGUSTUS BINION,
Author of 'Ancient Egypt, or Mizraim.'

Egyptian Bean, a name sometimes given to the bean-like fruits of the *Nelumbium speciosum*, or sacred lotus, found in China, India, Australia, but no longer on the Nile.

Egyptian Blue, a brilliant pigment consisting of the hydrated protoxide of copper mixed with a minute quantity of iron.

Egyptian Exploration Fund, a foundation for the excavation and study of Egyptology, set on foot by Amelia Blandford Edwards, the English novelist and Egyptologist. Edouard Naville, W. M. F. Petrie, and others have worked under its auspices, making important discoveries of ancient temples, writing, pottery, etc.

Egyptian Literature. The advance that has been made in recent years in the decipherment of the ancient writings of the world enables us to deal in a very matter-of-fact way with the Egyptian inscriptions. Their chief mysteries are solved, their philosophy is almost fathomed, their general nature is understood. The story they have to tell is seldom startling to the modern mind. The world was younger when they were written. The heart of man was given to devious ways then, as now and in the days of Solomon,—that we can affirm full well; but his mind was simpler; apart from knowledge of men and the conduct of affairs, the educated Egyptian had no more subtlety than a modern boy of 15, or an intelligent English rustic of a century ago.

To the Egyptologist by profession the inscriptions have a wonderful charm. The writing itself in its leading form is the most attractive that has ever been seen. Long rows of clever little pictures of things in heaven and earth compose the sentences; every sign is a plaything, every group a pretty puzzle, and at present, almost every phrase well understood brings a tiny addition to the sum of the world's knowledge. But these inscriptions, so rich in facts that concern the history of mankind and the progress of civilization, seldom possess any literary charm. If pretentious, as many of them are, they combine bald exaggeration with worn-out simile, in which ideas that may be poetical are heaped together in defiance of art. Such are the priestly laudations of the kings by whose favor the temples prospered. Take, for instance, the dating of a stela erected under Rameses II. on the route to the Nubian gold mines. It runs:—

On the fourth day of the first month of the season of winter, in the third year of the Majesty of Horus, the Strong Bull, beloved of the Goddess of Truth, lord of the vulture and of the uræus diadems, protecting Egypt and restraining the barbarians, the Golden Horus, rich in years, great in victories, King of Upper Egypt and King of Lower Egypt, *Mighty in Truth of Ra, Chosen of Ra*, the son of Ra, *Rameses Beloved of Amen*, granting life for ever and ever, beloved of Amen Ra lord of the "Throne of the Two Lands" in Apt Esut, appearing glorious on the throne of Horus

among the living from day to day even as his father Ra; the good god, lord of the South Land, Him of Edtu Horus bright of plumage, the beauteous sparrow-hawk of electrum that hath protected Egypt with his wing, making a shade for men, fortress of strength and of victory; he who came forth terrible from the womb to take to himself his strength, to extend his borders, to whose body color was given of the strength of Mentu; the god Horus and the god Set. There was exultation in heaven on the day of his birth; the gods said, "We have begotten him"; the goddesses said, "He came forth from us to rule the kingdom of Ra"; Amen spake, "I am he who hath made him, whereby I have set Truth in her place; the earth is established, heaven is well pleased, the gods are satisfied by reason of him." The Strong Bull against the vile Ethiopians, which uttereth his roaring against the land of the negroes while his hoofs trample the Troglodytes, his horn thrusteth at them; his spirit is mighty in Nubia and the terror of him reacheth to the land of the Kary; his name circulateth in all lands because of the victory which his arms have won; at his name gold cometh forth from the mountain as at the name of his father, the god Horus of the land of Baka; beloved is he in the Lands of the South even as Horus at Meama, the god of the Land of Buhen, King of Upper and Lower Egypt, *Mighty in Truth of Ra*, son of Ra, of his body, Lord of Diadems, *Rameses Beloved of Amen*, giving life for ever and ever like his father Ra, day by day. [Revised from the German translation of Professor Erman.]

As Prof. Erman has pointed out, the courtly scribe was most successful when taking his similes straight from nature, as in the following description, also of Rameses II.:—

A victorious lion putting forth its claws while roaring loudly and uttering its voice in the Valley of the Gazelles. . . . A jackal swift of foot seeking what it may find, going round the circuit of the land in one instant, . . . his mighty will seizeth on his enemies like a flame catching the ki-ki plant with the storm behind it, like the strong flame which hath tasted the fire, destroying, until everything that is in it becometh ashes; a storm howling terribly on the sea, its waves like mountains, none can enter it, every one that is in it is engulfed in Duat.

Here and there among the hieroglyphic inscriptions are found memorials of the dead, in which the praises of the deceased are neatly strung together and balanced like beads in a necklace, and passages occur of picturesque narrative worthy to rank as literature of the olden time. We may quote in this connection from the biographical epitaph of Ameny, who was governor of a province in middle Egypt for 25 years during the long reign of Usertesen I. (about 2716 B.C.). This inscription not only recounts the achievements of Ameny and the royal favor which was shown him, but also tells us in detail of the capacity, goodness, charm, discretion, and insight by which he attached to himself the love and respect of the whole court, and of the people over whom he ruled and for whose well-being he cared. Ameny says:—

I was a possessor of favor, abounding in love, a ruler who loved his city. Moreover I passed years as ruler in the Oryx nome. All the works of the house of the King came into my hand. Behold, the superintendent of the gangs of the domains of the herdsman of the Oryx nome gave me 3,000 bulls of their draught stock. I was praised for it in the house of the King each year of stock-taking. I rendered all their works to the King's house: there were no arrears to me in any of his offices.

The entire Oryx nome served me in numerous attendances. There was not the daughter of a poor man that I wronged, nor a widow that I oppressed. There was not a farmer that I chastised, not a herdsman whom I drove away, not a foreman of five whose men I took away for the works. There was not a pauper around me, there was not a hungry man of my time. When there came years of famine, I arose and ploughed all the fields of the Oryx nome to its boundary south and north, giving life to its inhabitants, making its provisions. There was not a hungry man in it. I gave to the widow as to her that possessed a husband, and I favored not the elder above the younger in all that I gave. Thereafter great rises of

EGYPTIAN LITERATURE

the Nile took place, producing wheat and barley, and producing all things abundantly, but I did not exact the arrears of farming.

Elsewhere in his tomb there are long lists of the virtues of Amenemhat, and from these the following may be selected both on account of picturesqueness of expression and the appreciation of fine character which they display:—

Superintendent of all things which heaven gives and earth produces, overseer of horns, hoofs, feathers, and shells. . . . Master of the art of causing writing to speak. . . . Caressing of heart to all people, making to prosper the timid man, hospitable to all, escorting [travelers] up and down the river. . . . Knowing how to aid, arriving at time of need; free of planning evil, without greediness in his body, speaking words of truth. . . . Unique as a mighty hunter, the abode of the heart of the King. . . . Speaking the right when he judges between suitors, clear of speaking fraud, knowing how to proceed in the council of the elders, finding the knot in the skein. . . . Great of favors in the house of the King, contenting the heart on the day of making division, careful of his goings to his equals, gaining reverence on the day of weighing words, beloved of the officials of the palace.

The cursive forms of writing—hieratic from the earliest times, demotic in the latest—were those in which records were committed to papyrus. This material has preserved to us documents of every kind, from letters and ledgers to works of religion and philosophy. To these, again, "literature" is a term rarely to be applied; yet the tales and poetry occasionally met with on papyri are perhaps the most pleasing of all the productions of the Egyptian scribe.

It must be confessed that the knowledge of writing in Egypt led to a kind of primitive pedantry, and a taste for unnatural and to us childish formality; the free play and naïveté of the story-teller is too often choked, and the art of literary finish was little understood. Simplicity and truth to nature alone gave lasting charm, for though adornment was often attempted, their rude arts of literary embellishment were seldom otherwise than clumsily employed.

A word should be said about the strange condition in which most of the literary texts have come down to us. It is rarely that monumental inscriptions contain serious blunders of orthography; the peculiarities of late archaic inscriptions which sometimes produce a kind of "dog Egyptian" can hardly be considered as blunders, for the scribe knew what meaning he intended to convey. But it is otherwise with copies of literary works on papyrus. Sometimes these were the productions of schoolboys copying from dictation as an exercise in the writing school, and the blank edges of these papyri are often decorated with essays at executing the more difficult signs. The master of the school would seem not to have cared what nonsense was produced by the misunderstanding of his dictation, so long as the signs were well formed. The composition of new works on the model of the old, and the accurate understanding of the ancient works, were taught in a very different school, and few indeed attained to skill in them. The boys turned out of the writing school would read and write a little; the clever ones would keep accounts, write letters, make out reports as clerks in the government service, and might ultimately acquire considerable proficiency in this kind of work. Apparently men of the official class sometimes amused themselves with puzzling over an ill written copy of some ancient tale, and with trying to copy portions of it.

The work, however, was beyond them; they were attracted by it, they revered the compilations of an elder age and those which were "written by the finger of Thoth himself"; but the science of language was unborn, and there was little or no systematic instruction given in the principles of the ancient grammar and vocabulary. Those who desired to attain eminence in scholarship after they had passed through the writing school had to go to Heliopolis, Hermopolis, or wherever the principal university of the time might be, and there sit at the feet of priestly professors; who we fancy were revered as demigods, and who in mysterious fashion and with niggardly hand imparted scraps of knowledge to their eager pupils. Those endowed with special talents might after almost lifelong study become proficient in the ancient language. Would that we might one day discover the hoard of rolls of such a copyist and writer!

There must have been a large class of hack-copyists practised in forming characters both uncial and cursive. Sometimes their copies of religious works are models of deft writing, the embellishments of artist and colorist being added to those of the calligrapher; the magnificent rolls of the 'Book of the Dead' in the British Museum and elsewhere are the admiration of all beholders. Such manuscripts satisfy the eye, and apparently neither the multitude in Egypt nor even the priestly royal undertakers questioned their efficacy in the tomb. Yet are they very apples of Sodom to the hieroglyphic scholar, fair without but ashes within. On comparing different copies of the same text, he sees in almost every line omissions, perversions, corruptions, until he turns away baffled and disgusted. Only here and there is the text practically certain, and even then there are probably grammatical blunders in every copy. Nor is it only in the later papyri that these blunders are met with. The hieroglyphic system of writing, especially in its cursive forms, lends itself very readily to perversion by ignorant and inattentive copyists; and even monumental inscriptions, so long as they are mere copies, are usually corrupted. The most ridiculous perversions of all date from the Ramesside epoch when the dim past had lost its charm, for the glories of the 18th dynasty were still fresh, while new impulses and foreign influence had broken down adherence to tradition and isolation.

In the 8th century B.C. the new and the old were definitely parted, to the advantage of each. On the one hand the transactions of ordinary life were more easily registered in the cursive demotic script, while on the other the sacred writings were more thoroughly investigated and brought into order by the priests. Hence, in spite of absurdities that had irremediably crept in, the archaic texts copied in the 26th dynasty are more intelligible than the same class of work in the 19th and 20th dynasties.

In reading translations from Egyptian, it must be remembered that uncertainty still remains concerning the meanings of multitudes of words and phrases. Every year witnesses a great advance in accuracy of rendering; but the translation even of an easy text still requires here and there some close and careful guess-work to supply the connecting links of passages or words that are thoroughly understood, or the resort to some conventional rendering that has

EGYPTIAN SUDAN—EGYPTIAN VULTURE

become current for certain ill understood but frequently recurring phrases. The Egyptologist is now to a great extent himself aware whether the ground on which he is treading is firm or treacherous, and it seems desirable to make a rule of either giving the public only what can be warranted as sound translation, or else of warning them where accuracy is doubtful. A few years ago such a course would have curtailed the area for selection to a few of the simplest stories and historical inscriptions; but now we can range over almost the whole field of Egyptian writing, and gather from any part of it warranted samples to set before the reading public. The labor, however, involved in producing satisfactory translations for publication, not mere hasty readings which may give something of the sense, is very great; and at present few texts have been well rendered.

We may now sketch briefly the history of Egyptian literature, dealing with the subject in periods:

1. *The Ancient Kingdom, About 4400 B.C.—3000 B.C.*—The earliest historic period—from the First Dynasty to the Third, about 3766 B.C.—has left no inscriptions to any extent. Some portions of the 'Book of the Dead' (q.v.) profess to date from these or earlier times, and probably much of the religious literature is of extremely ancient origin. The first book of 'Proverbs' in the Prisse Papyrus is attributed by its writer to the end of the Third Dynasty (about 3766 B.C.). From the Fourth Dynasty to the end of the Sixth (3100 B.C.) the number of the inscriptions increases; tablets set up to the kings of the Fourth Dynasty in memory of warlike raids are found in the peninsula of Sinai, and funerary inscriptions abound. The pyramids raised at the end of the Fifth and during the Sixth Dynasties are found to contain interminable religious inscriptions, forming almost complete rituals for the deceased kings. Prof. Maspero, who has published these texts, states that they "contain much verbiage, many pious platitudes, many obscure allusions to the affairs of the other world, and among all this rubbish some passages full of movement and wild energy, in which poetical inspiration and religious emotion are still discernible through the veil of mythological expressions." Of the funerary and biographical inscriptions the most remarkable is that of Una, an official of King Mer-en-ra (Sixth Dynasty).

Another, later but hardly less important, is on the façade of the tomb of Hehrhuf, at Aswan, and recounts the expeditions into Ethiopia and the southern oasis which this resourceful man carried through successfully. In Hehrhuf's later life he delighted a boy king of Egypt by bringing back for him from one of his raids a grotesque dwarf dancer of exceptional skill; the young Pharaoh sent him a long letter on the subject, which was copied in full on the tomb as an addition to the other records there. It is to the Fifth Dynasty also that the second collection of 'Proverbs' in the Prisse Papyrus is dated. The Seventh and Eighth Dynasties have left us practically no records of any kind.

2. *The Middle Kingdom, 3000–1600 B.C.*—The Middle Kingdom from the Ninth to the Seventeenth Dynasty, shows a great literary development. Historical records of some length

are not uncommon. The funerary inscriptions descriptive of character and achievement are often remarkable.

Many papyri of this period have survived: the Prisse Papyrus of 'Proverbs,' a papyrus discovered by Mr. Flinders Petrie with the 'Hymn to Usertesen III.,' papyri at Berlin containing a dialogue between a man and his soul, the 'Story of Sanehat,' the 'Story of the Sekhti,' and a very remarkable fragment of another story; besides the 'Westcar Papyrus of Tales' and at St. Petersburg the 'Shipwrecked Sailor.' The productions of this period were copied in later times; the royal 'Teaching of Amenemhat' and the worldly 'Teaching of Dauf' as to the desirability of a scribe's career above any other trade or profession, exist only in late copies. Portions of the 'Book of the Dead' are found inscribed on tombs and sarcophagi.

3. *The New Kingdom, etc.*—From the New Kingdom, 1600–700 B.C., we have the 'Maxims of Any,' spoken to his son Khonsu Hetep, numerous hymns to the gods, including that of King Akhenaten (Amenhotep IV.) to the disk of the sun, and hymns to Amen Ra. Inscriptions of every kind, historical, mythological, and funereal abound. The historical inscription of Piankhi is of very late date. On papyri the stories of 'The Two Brothers,' of 'The Taking of Joppa,' and of the 'Doomed Prince.'

From the Saite period (Twenty-sixth Dynasty, 160 B.C.) and later, there is little worthy of record in hieroglyphics; the inscriptions follow ancient models. In demotic we have the 'Story of Setna,' a papyrus of moralities, a chronicle somewhat falsified, a harper's song, a philosophical dialogue between a cat and a jackal, and others.

Here we might end. Greek authors in Egypt were many; some were native, some of foreign birth or extraction, but they all belong to a different world from the ancient Egyptian. With the adaptation of the Greek alphabet to the spelling of the native dialects, Egyptian came again to the front in Coptic, the language of Christian Egypt. Coptic literature, if such it may be called, was almost entirely produced in Egyptian monasteries and intended for edification. Let us hope that it served its end in its day. To us the dull, extravagant, and fantastic 'Acts of the Saints,' of which its original works chiefly consist, are tedious and ridiculous except for the linguist or the church historian. They certainly display the adjustment of the ancient Egyptian mind to new conditions of life and belief; but the introduction of Christianity forms a fitting boundary to our sketch. See EGYPT; HIEROGLYPHICS.

SAMUEL AUGUSTUS BINION,
Author of 'Ancient Egypt or Mizraim.'

Egyptian Sudan. See SUDAN.

Egyptian Vulture (*Neophron percnopterus*), a well-known bird which frequents both shores of the Mediterranean, southern India, and, during the winter, south Africa. It is the scavenger of Egyptian villages, collecting in numbers where carrion or garbage is deposited, but feeding also on frogs, lizards, and small mammals found in cultivated fields. The birds usually go in pairs, however, and addict themselves to particular localities, being only drawn together in numbers by abundance of their favorite food. The name, as also that of Pharaoh's hen, is

given because of the frequent representation of this bird in Egyptian sculpture. See VULTURE.

Egyptology, the science of Egyptian antiquities. See EGYPT.

Ehninger, ān'ing'ēr, **John Whetton**, American artist: b. New York 22 July 1827; d. Saratoga, N. Y., 22 Jan. 1889. He was graduated at Columbia College, studied two years under Couture in Paris and later at Düsseldorf, and served as staff-artist for an illustrated London journal. He was elected a National Academician in 1860. His works include landscape and figure subjects, among them being: 'Peter Stuyvesant' (1850); 'Eight illustrations of Miles Standish' (1858); 'Autumnal Landscape' (1867); 'Twilight from the Bridge of Pau, Basses-Pyrenees' (1878); 'Subject for Thanksgiving' (1879); 'Lady of the Manor' (1882); 'The Old, Old Story' (1884).

Ehrenberg, ā'rēn-bērg, **Christian Gottfried**, German scientist: b. Delitzsch 19 April 1795; d. Berlin 27 June 1876. After studying theology, medicine, and natural history at Leipzig and Berlin, he joined in 1820 an expedition to Palestine, Egypt, and Abyssinia, returning to Berlin in 1825. In 1820 he accompanied Humboldt to the Ural and Altai ranges and to central Siberia. His great work on 'Infusoria' ('Die Infusionstierchen als vollkommene Organismen') appeared in 1838, and was at once recognized as the highest authority on the subject. It was followed in 1854 by his 'Microgeology.' Ehrenberg's work gave an enormous impetus to the study of microscopic organisms. He was the first to show that the phosphorescence of the sea is due to the presence of hosts of animalcules. Consult 'Life,' by Lane (1895).

Ehrle, Francis, German Catholic scholar: b. Isny, Württemberg, 17 Oct. 1845. He was educated at the Jesuit College, Munster, Westphalia, and after several years in mission work was transferred to Rome, where he devoted himself to historical studies. His 'History of the Church and its Literature in the Middle Ages' (in German) is based on extensive researches in the archives of Germany, England, Spain, and Italy. It is on this work that his reputation largely rests; but he has further written a Latin history of the Papal library from 1200 to 1417, and (with Stevenson) a history of the Vatican. He was made prefect of the Pontifical Library, and placed in charge of the Papal exhibit at the Louisiana Purchase Exposition, Saint Louis.

Eibenstock, i'bēn-stōk, Germany, town in the southeast of Saxony, near the Mulde, with important manufactures of lace. The tin mines nearby have been worked for about eight centuries. It is connected by rail with Chemnitz, about 40 miles distant. Pop. 7,500.

Eichberg, i'h'bērg, **Julius**, American composer: b. Düsseldorf, 13 June 1824; d. Boston, Mass., 19 Jan. 1893. After being professor in the Conservatoire at Geneva, he removed to New York in 1857, and in 1859 went to Boston, where he was director of the orchestra at the Boston Museum for seven years. In 1867 he established the Boston Conservatory of Music, of which he was at the head till his death. Four of his operettas are well known: 'The Doctor of Alcantara'; 'The Rose of Tyrol'; 'The Two Cadis'; and 'A Night in Rome.'

Eichendorff, i'hēn-dōrf, **Baron Joseph von**, German poet: b. Castle of Lubowitz, Silesia, 10 March 1788; d. Neisse 26 Nov. 1857. He was one of the most gifted and original romantic lyricists of Germany. His principal works are: 'Presage and Presence'; 'War to the Philistines,' a dramatic story; 'The Life of a Good-for-Nothing,' idealizing vagabondage; the tragedies 'Ezzelin von Romano,' 'The Last Hero of Marienburg'; and other plays, and a number of histories of German literature, including 'The Ethical and Religious Meaning of the New Romantic Poetry in Germany' (1847); 'German Romance of the Eighteenth Century in Relation to Christianity' (1851); 'History of German Poetry' (1857).

Eichens, Friedrich Eduard, frēd'rīh ed'oo-ārd i'hēnz, German engraver: b. Berlin 27 May 1804; d. 5 May 1877. He studied in Berlin, Paris, and Parma, and returning to Berlin in 1832 was made a member of the Academy. He left many works, including: 'Vision of Ezekiel' after Raphael; 'Magdalen' after Dominichino; 'Christ in the Tomb' after H. Carrache; 'Prince Radziwill on His Deathbed' after M. Hanzel; and some engravings after Kaeilback.

Eichens, Philip Herman, German lithographer and engraver: b. Berlin 13 Sept. 1812; d. 1886. He was a brother of F. E. Eichens (q.v.). He studied under Henzel at the Berlin Academy, and among his engravings are: 'La Joconde'; and 'Return of the Pirates of Meyerkeim.' He received medals for his lithographs in Paris 1842, 1859, 1861, and 1863.

Eichhoff, Friedrich Gustav, frēd'rīh goos-tāf i'h'hōf, French philologist: b. Havre 17 Aug. 1799; d. Paris 10 May 1875. In 1842 he became professor of foreign languages at Lyons and in 1851 inspector-general of the University of Paris. He wrote a 'General Indo-European Grammar' (1867); etc.

Eichhorn, Johann Gottfried, yō'hān gōt'-frēd i'h'hōrn, German theologian and Orientalist: b. Dörrenzimmern 16 Oct. 1752; d. Göttingen 25 June 1827. In 1775 he became professor of Oriental languages at Jena, and in 1788 at Göttingen. He edited a 'Repertory of Biblical and Oriental Literature' (1777-86); 'Universal Library of Biblical Literature' (1787-1803); and wrote 'Historico-Critical Introductions' to the Old and to the New Testament, and to the Apocryphal Books of the Old Testament; a 'Latin Commentary on the Apocalypse'; etc.

Eichrodt, Ludwig, lood'vīg, German poet: b. Durlach, Baden, 2 Feb. 1827; d. Lahr 2 Feb. 1892. He studied at Heidelberg and Freiburg and published in 1848 in 'Fliegende Blätter' his comic songs, 'Wanderlust,' which had great popularity. Among his works are: 'Poems of All Humors' (1855); 'Life and Love' (1856); 'The Chateau of the Voges' (1858); 'Hortus Deliciarum' (1875); 'Gold' (1880).

Eichstätt, i'h'stēt, or **Eichstädt**, Middle Franconia, Bavaria, an old town in a deep valley of the Altmühl, 67 miles north-northwest of Munich. Its principal edifice is a fine Gothic cathedral, founded in 1259. Pop. 7,489.

Eider, a river of Prussia, in Schleswig-Holstein, which rises about 12 miles from Kiel, flows generally northwest, and after a course of 112 miles, of which 60 are navigable, empties into the North Sea at Tönning.

EIDER DUCK—EIGHT-HOUR DAY

Eider Duck, a bird of the sub-family *Fuliginæ*, or sea ducks, genus *Somateria*, distinguished by the peculiar form and feathering of the bill, and closely allied to the scoter ducks. The several species are confined to the northern regions. The American eider (*S. dresseri*) and the European eider (*S. mollissima*) are closely similar species which breed on solitary rocky shores and islands from Maine and the Farne Islands respectively, northward, the former species wintering as far south as the Delaware River. They are most abundant in Labrador, Newfoundland, Greenland, Iceland, and Norway, where they are stringently protected by law. Both species breed gregariously and in particular spots their nests are so abundant that a person can scarcely walk without treading on them. Their nests are usually formed of grass, dry sea-weed, etc., lined with a quantity of down which the female plucks from her own breast. In this soft bed she lays five eggs, which she covers over with a layer of down; then the natives, who watch her operations, take away both the eggs and the down, and this removal is repeated as often as she lays until the close of the season, when the last lot of eggs is allowed to hatch and the down removed from the nest only after the young have left. The drake does not, as is often stated, furnish any of the down. One female generally furnishes a few ounces of down. This down, from its superior warmth, lightness, and elasticity, is preferred by the luxurious to every other article for beds and coverlets; and, from the great demand for it, those districts in Norway, Greenland, and Iceland where these birds abound are regarded as the most valuable property and are guarded with the greatest vigilance. Proprietors endeavor to attract them by supplying artificial nests and otherwise, and when they settle in an island off shore, cattle and herdsmen are removed to allow them to breed undisturbed. The down from dead birds is little valued, having lost its elasticity.

The length of the eider duck is about 2 feet 3 inches, extent of the wings 3 feet, weight from 6 to 7 pounds; the head is large and the bill of singular structure, being 3 inches in length, forked at the base of the upper mandible in a remarkable manner, running high up on the forehead, and having the feathers on each side descending nearly to the nostrils; the whole of the bill is of a dull, yellowish horn color, somewhat dusky in the middle. The male is black beneath, head and back white, with a black crown. The female is reddish drab, spotted with black, with two white bands across the wings. Eiders associate in flocks, diving to great depths for shell-fish, which constitute their principal food. They live much on the water, retiring to the shores to rest, particularly on the appearance of an approaching storm. Their flesh is eaten, but tastes strongly of fish. The eggs, however, are esteemed. These and the down are both frequently obtained at the hazard of life by people let down by ropes from craggy steep.

Other species are the Pacific eider (*S. v-nigra*), and the remarkable king eider (*S. spectabilis*) of high Arctic regions. The now extinct Labrador duck (q.v.) is closely related.

Eidograph, i'dō-graf, an instrument for copying designs invented by Prof. Wallace to re-

duce or enlarge them in any proportion, within certain limits; a form of pantograph.

Eidoscope, i'dō-skōp, an instrument on the principle of the kaleidoscope, which produces an infinite variety of geometrical figures by the independent revolution of two perforated metallic disks. It may be employed with the magic lantern, when rapidly rotated, causing flashing rays of light, forming singular combinations to appear upon the screen. Various colored glass disks may be used, producing striking combinations of color.

Eifel, i'fēl, **The**, a barren and bleak plateau of Rhenish Prussia, between the Rhine, Moselle, and Roer rivers, showing extensive traces of volcanic action. Its surface is diversified by crater-like depressions and volcanic peaks and ridges.

Eiffel, ā-fēl or i'fēl, **Alexandre Gustave**, French engineer: b. Dijon 15 Dec. 1832. In 1858 he was intrusted with the construction of the large iron bridge over the Garonne at Bordeaux, and was one of the first to introduce caissons worked with compressed air. The bridge over the Douro at Oporto, the great viaduct of Garabit, in Cantal, and that over the Tardes, near Montluçon, and the gigantic locks designed and partly prepared for the Panama Canal are among later triumphs of his engineering skill; while in the huge framework erected for Bartholdi's 'Statue of Liberty' may be seen the germ of the idea which afterward assumed the form of the colossal iron structure (1887-9) on the Champs-de-Mars in Paris, with which his name is identified. See EIFFEL TOWER.

Eiffel Tower, **The**, a notable structure in Paris. The plans for the exposition of 1889 included a monstrous iron tower, to be raised on the Champs-de-Mars, 1,000 feet high. The designer, Gustave Eiffel, constructed it of iron lattice-work, with three elevators giving access to the summit. The uses of so stupendous an undertaking are many, and it became one of the chief permanent ornaments of the city. Its importance from a meteorological point of view cannot be overestimated, the tower enabling meteorologists to study the decrease of temperature at different heights, to observe the variations of winds, and to find out the quantity of rain that falls at different heights, and the density of the clouds.

Eigenmann, i'gen-mān, **Carl H.**, American zoologist: b. Flehingen, Germany, 1863. He was graduated at Indiana University in 1886 and studied at Harvard 1887-8. Between 1888 and 1892 he continued his scientific investigations in San Diego Biological Laboratory, the Woods Holl Marine Stations, and in the explorations undertaken for the British Museum in California, Oregon, Idaho, Montana, Dakota, and western Canada. He was appointed professor of zoology in Indiana University in 1891 and in 1895 founded and assumed the direction of the Biological Station of Indiana University. He has contributed more than a hundred papers to the proceedings of scientific societies and to scientific journals.

Eigg. See Egg.

Eight-hour Day. In the struggle for the shortest hours of labor compatible with the highest efficiency, begun in Great Britain early in the

EIGHT-HOUR LAW — EILETHYIA

19th century, the first great landmark was the 'Ten Hours' Bill of 1847, enforcing in all trades what had come about in many. But the golden ideal since 1824 (announced as such by Robert Owen in 1817) has been eight hours; possibly in remembrance that such was the rule in mediæval England; partly perhaps from the tempting threefold division of the day into equal parts, as in the rhyme "Eight hours for work, eight hours for play, eight hours for sleep, eight 'bob' a day." The eight-hour day was won in Australia in 1858. The movement on the Continent dates from the foundation of the "International" in 1804, and as a world-demand of the social reformers, from the Paris Trades-Union Congress of 1883. In the United States, till recently the subject was left to the States and to private contests, the government aiding by making short hours in its own works. In 1840 President Van Buren reduced the working day in the government navy yards to 10 hours. The first State 10-hour law, for textile workers only, was of 1849, in Pennsylvania. The first Massachusetts law was in 1874, and was due largely to the "Knights of St. Crispin." But the eight-hour movement had long before become general: in 1866 the demand was formulated at a general workingmen's congress at Baltimore, and at other meetings; and the National Labor Union was organized to secure an eight-hour day. A six weeks' strike in New England and New York, April-May 1866, attempted to secure it, but failed. In 1867 Connecticut and Illinois passed laws making eight hours a legal day "unless otherwise agreed." Pennsylvania followed in 1868 and New York in 1870. On 24 June 1869 the United States enacted an eight-hour day for its establishments; but the managers reduced wages correspondingly, allowing those who wished to work 10 hours at the old wages, which aroused such wrath that the President revoked the order. All these laws were rendered nugatory by the contracting-out clauses. In 1872 eight-hour leagues were formed in various places, and in Connecticut and New York a mass of strikes among the wood-working trades won this goal for a while; but the great depression from 1873 on prevented pressing such questions. Since 1880 several States have enacted the eight-hour law under the above conditions. But the first great concerted effort for eight hours was in 1886, when 200,000 workmen went on strike; it was at an eight-hour meeting in Haymarket Square, Chicago, that the anarchist bomb was thrown. A general strike was announced for this object in 1890, but was only partially successful, several hundred thousand workmen struck, and many employers yielded, but soon advanced the hours. The first really efficient national law was of 1 Aug. 1892, enforcing eight hours upon all laborers, mechanics, or contractors in the District of Columbia, under pain of fine and imprisonment. The short-hours' movement was first begun to protect women and children, the men sharing incidentally. It may be added that the practical results of the system are almost universally favorable. See Webb and Cox, 'The Eight-Hour Day' (1891); Rae, 'Eight Hours for Work' (1894).

Eight-hour Law, an act adopted in 1868 by the United States Congress, providing that in all government employment eight hours shall constitute a day's work. It originated in the

agitation which had begun in England in 1833 by the proposition of eight hours as a legitimate working day. The agitation spread itself among the industrial classes throughout the civilized world, and first bore fruit in Australia in 1850, where it was adopted by several trades. The National Labor Union of the United States demanded it in 1866, and it came into effect in the government navy yards in 1869, and shortly afterward in all departments of government work. Its universal adoption, however, is still unrealized, and it is the source of persistent agitation among the labor organizations and parties throughout the United States, the British Empire, and on the continent of Europe. Consult: Rae, 'Eight Hours for Work' (1894).

Eighth Nerve. See AUDITORY NERVE.

Eikon Basilike, i'kōn ba-sil'i-kē (Gr. "the royal image"), a work the full title of which is *Eikōn Basilikē*: 'The Portraiture of His Sacred Majesty in His Solitudes and Sufferings.' It was published 9 Feb. 1649, 10 days after the execution of Charles I., and within 12 months ran through 50 editions in various languages. It professes to be Charles' own composition in the form of a diary. It is written in an affectedly dignified strain, and contains numerous assertions of love for his misguided and ungrateful people. At the Restoration, Gauden, afterward bishop of Worcester, laid claim to the authorship, and a memorandum in the copy of the Earl of Anglesea, lord privy-seal under Charles II., affirms that claim with the authority of Charles II. and the Duke of York. Milton's answer to it, 'Eikonoklastes' (that is "image-breaker") appeared the same year by order of Parliament. Gauden professed to have begun the work in or about the year 1647, and to have submitted a MS. copy of it to the king. On the other hand, those who maintain that the work was by Charles, assert that he had written the first six of its 28 chapters before the battle of Naseby (1645). The question is one of much complexity. Historians generally, from Lingard to Green, have pronounced against Charles; while some of those who have sifted his claims are in his favor. See GAUDEN, JOHN.

Bibliography.—Almack, 'Bibliography of the King's Book' (1896); Doble, in the 'Academy' (1883); Scott (E. J. L.) 'Comments in Edition of the Work' (1880); Wordsworth (Christopher), 'Who Wrote Icon Basilike?' (1824-5); 'King Charles I., the Author of Icon Basilike' (1828).

Eildon (ēl'dōn) **Hills**, three peaks belonging to a single mass, south of Melrose, in Roxburghshire, Scotland. The highest attains an elevation of 1,385 feet above sea-level, and all command a splendid prospect and are rich in historic and legendary associations.

Eilenburg, i'lēn-boorg, Germany, town of Prussian Saxony, in the government of Merseburg, mainly situated on an island of the Mulde, 14 miles northwest of Leipsic. It has manufactures of calico, woolen cloth, and chemicals. Pop. (1900) 15,147.

Eilethyia (hieroglyph. *Nekheh*; city of Lucina, now called EL-KĀB), a city of ancient Egypt, situated on the right bank of the Nile, a little below Edfu. The present ruins consist of the remains of small temples dedicated by Ramesses III. to Ra; a Ptolemaic temple dedicated

EIMBECH — EISENACH

to the eponymous goddess Lucina by Physcon or Euergetes II., with additions by Ptolemy Alexander I. and the elder Cleopatra; and an ancient temple dedicated by Amenophis III. to the local deities. The names of other monarchs are also found in the ruins; but the most interesting and important remains are the rock-tombs, some as early as the 13th dynasty, excavated in the hills. That of Aahmes, the "captain of the sailors," records his services in the wars of the early monarchs of the 18th dynasty against the Hyksos or Shepherds, and other Asiatic and Nigritic races. Another, that of Pahir, is decorated with rich and elaborate paintings, representing the pursuits of agriculture, fowling, fishing, etc. The city was an outpost against the southern tribes, and its fort, a large enclosure of crude brick, was of importance as early as the Shepherd war. The goddess Suben (Eilethya or Lucina) was a special protectress of Upper Egypt. Consult: Brugsch, 'Reiseberichte,' and 'Egypt Under the Pharaohs'; Wilkinson, 'Ancient Egyptians'; Mariette, 'Ancient Egyptian History.'

Eimbeck, im'bĕk, **William**, American geodest: b. Brunswick, Germany, 29 Jan. 1841. He was for two years professor of mechanics and engineering, Washington University, and a member of the government solar eclipse expeditions to Illinois 1869 and to Italy 1870. He has been a Fellow of the American Association for the Advancement of Science since 1879, and is the inventor of the invariable reversible pendulum and the duplex base apparatus of coast and geodetic survey. His chief work has been in connection with the western divisions of the 39th parallel triangulation across the continent.

Eimeo, i'mĕ-ō, one of the Society Islands, in the Pacific Ocean, about 20 miles west-northwest of Tahiti, the principal member of the group; area 51 square miles. It consists of deep valleys and abrupt hills — the former well cultivated, and the latter heavily timbered. Here Christianity was first introduced in Polynesia; and here the South Sea College of the London Missionary Society was established. Most of the natives are Protestants. Pop. 1,500.

Einbeck, in'bĕk, or **Eimbeck**, Germany, town of Prussia, in the province of Hanover, on the Ilme, near its junction with the Leine, 40 miles south of Hanover. It carries on several industries, and the formerly celebrated Eimbecker bier ("bock" beer) is still made here. Einbeck was a place of importance in the 15th century. It was a member of the Smalkaldic League, and it figured prominently in the Thirty Years' and the Seven Years' wars. There are still remains of its old walls and towers. Pop. 8,436.

Einhard. See EGINHARD.

Einhorn, in'hörn, **David**, American rabbi: b. Dispeck, Bavaria, 10 Nov. 1809; d. New York 2 Nov. 1879. His first rabbinical position was at Hopstadten, Bavaria, and shortly afterward he became chief rabbi of the grand duchy of Mecklenburg-Schwerin. In 1851 he was called to Pesth, but his progressive tendencies aroused sharp opposition and his temple was closed by order of the government. In 1855 he was invited to become rabbi of the Har Sinai Congregation, of Baltimore, Md. His activity was now to be rapidly developed, for he issued his prayer-

book, which was warmly received by many reformed Jewish congregations, and he began the publication of a scholarly monthly magazine in German, entitled 'Sinai,' in the interests of advanced reform. His vigorous onslaughts on slavery in 1861 led to his removal from Baltimore to Philadelphia, there becoming rabbi of the Keneseth Israel Temple, and publishing his catechism. In 1866 he was elected rabbi of the Adath Teshurun Temple in New York, where he continued a zealous, impassioned and scholarly advocate of reform and the leader of the then radical school, until his retirement in July 1879.

Einsiedeln, in'zē dĕln (place of the solitaires or hermits), a small town in Switzerland, canton of Schwyz, seat of a renowned abbey of Benedictine monks since the middle of the 9th century. It is a famous resort of pilgrims who visit the place in thousands to venerate an ancient miraculous image of the Blessed Virgin. For the accommodation of the pilgrims the little town has more than 50 inns or houses of entertainment. Those pilgrimages are made throughout the year, but the great annual pilgrimage culminates on the anniversary of the dedication of the abbey's church, 14 September. The present abbey is the successor of four previous edifices which were destroyed by fire; it was erected in the first quarter of the 18th century, and is an imposing pile, in the Italian style. The place was visited by Edward Gibbon, the historian, 1755, who writes that he was "astonished by the profane ostentation of riches in the poorest corner of Europe; amidst a savage scene of woods and mountains a palace appears to have been erected by magic, and it was erected by the potent magic of religion." The abbey which Gibbon then saw is still in existence and is annually visited by more than 150,000 pilgrims. It was plundered of its vast treasure of silver and gold and precious stones by the French (1798), but it is still very rich, especially in literary monuments, possessing a library of 40,000 volumes, 1,190 manuscripts, and more than 1,000 productions of the printing press in its early period.

Eiselen, Wilhelm Bernard, vī'hĕlm bĕr'nārd i'zē lĕn, German gymnast: b. Berlin 27 Sept. 1792; d. Misdroy, 22 Aug. 1846. His early studies began in Berlin, and he was the pupil of the eminent gymnast Jahns. He soon became prominent among the young gymnasts of Berlin, and in 1819 began to teach mathematics. He opened a fencing school in 1825 in Berlin and a gymnasium in 1828, and had a vast number of pupils. The first gymnasium for young girls was instituted by him in 1832. He published many works on gymnastics and fencing.

Eisenach, i'zē-nāh, Germany, town in the grand duchy of Saxe-Weimar, at the northwest end of the Thuringian Forest, at the confluence of the Nesse with the Hösels, 17 miles west of Gotha. In the market-place there is a monument to the memory of those from the neighborhood who fell in the war of 1870-1, and in the Karlsplatz stands the Luther memorial, unveiled in 1895. It contains many old buildings of historical and architectural importance. The manufactures are extensive, and comprise coloring materials, white-lead, woollens, beer, leather, pottery, tobacco, oil, machinery, etc. The town has many interesting historical associations. Luther

was at school here, and Sebastian Bach, to whom there is a statue, was born here. Near it is the Wartburg, where Luther resided for a time for safety. Eisenach was formerly the capital of a principality of the same name. Pop. (1900) 34,553.

Eisenberg, i'zén-běrg, Germany, a town in the province of Saxe-Altenburg, of great antiquity, birthplace of the philosopher Krause, whose statue is set up there. It possesses a famous castle, Christiansburg, and is the seat of many manufactures. Pop. (1895) 7,956.

Eisenerz, i'zén-ertz, Austria, a mining town of Austria, in the north of Styria, 20 miles northwest of Bruck. It stands in a narrow mountain valley at the foot of the Erzberg (5,000 feet), a mountain so rich in iron ore that the miners, instead of cutting mines into it and following the metal in veins, quarry the rock from the outside. Aragonite of the purest white, and resembling coral branches in form, is found in caves in the mountain. Pop. 7,000.

Eisenmenger, i'zén-měng-ér, August, Austrian fresco painter; b. Vienna 11 Feb. 1830. He studied in the Vienna Academy, and early gained the first prize in drawing (1845). In 1863 he was appointed teacher of drawing in the Protestant Real-schule of Vienna. His first work of importance was the fresco which he executed in the hall of the Society of Musical Amateurs (*Musik Freunde*), 'Apollo with the Muses'; but he has painted many notable frescoes in other public buildings. He was appointed professor of the Vienna Academy in 1872, and at the same time opened a private school of fresco painting.

Eisleben, is'lā-běn, Germany, town in Prussian Saxony, 18 miles to the west of Halle, famous as the place where Martin Luther was born and died. The royal gymnasium, originally founded by Luther, was rebuilt in 1883. The house in which Luther died has been recently restored. In 1883, on the occasion of the celebration of the 400th anniversary of Luther's birth, a statue of him was unveiled in the market-place. Copper and silver are mined in the neighborhood of Eisleben. A considerable trade in flower and vegetable seeds is carried on. Pop. (1900) 23,900.

Eisteddfod, i-stet'h'vöd, the name of an assembly of Welsh bards for the purpose of musical and poetical contests. They were held at different places for the minstrels of their respective neighborhoods; at Caerwys, at Aberfraw in Anglesea, and at Mathrafel in Powys. The judges were appointed by commissions from the native princes, and after the conquest from the English kings. The last was issued in 1568; but the ancient custom has been again revived by the Gwynnedigion and Cambrian societies, and annual meetings for the recitation of prize poems and performances on the harp are now held under the name of Eisteddfod. The Eisteddfod proper was announced a year and a day beforehand at an assembly called a gorsedd, at which prizes for the previous competition were awarded. At the present time yearly eisteddfods are held alternately in the north and south of Wales; and in some parts of the United States, especially throughout Pennsylvania, and other sections settled by the Welsh people, annual meetings take place, in every way similar

to the rite in their native land. During the Columbian Exposition at Chicago probably the most notable Eisteddfod held in this country, took place there.

Ejectment and Eviction. Ejectment in law is a mixed action, as it is resorted to in order to recover the possession of land, and damages for the wrongful withholding of it, though the damages are nominal. Originally, it was a possessory action—that is, adapted to the recovery of the possession of land. It ultimately became a convenient means of testing the title by a series of fictions. The supposition was (and this was the substance of the fiction) that a lease for a certain number of years had been made to a tenant, "John Doe," who had entered into possession, and had then been ejected by a person supposed to represent the party to be finally made defendant. This person was called "a casual ejector," and was usually represented as "Richard Roe." An action was then brought, substantially under the following title: "Doe, as tenant of Edwards (claiming the land), against Roe." A written notice was thereupon sent in the name of Roe by Edwards' attorney to the opposing claimant (Jones), who is the person in possession. By this notice Jones was advised to defend the action, otherwise Roe would permit judgment to be taken against him, and the possession would be lost. Jones, on making application to be made defendant, was allowed to defend on condition that he would admit the validity of the fictitious portion of these proceedings, so that the matter was narrowed down to a trial of the merits of the case. The action was now deemed to be between Edwards and Jones, although Doe still remained plaintiff on the records of the court. It was a rule in this action that the plaintiff can only recover upon a legal title, as distinguished from a title in a court of equity. He can succeed upon the strength of his own title, and of its validity, and not upon the weakness of that of his adversary. He must also have a right of entry. Where that does not exist another form of action must be resorted to. This method of procedure was defective in one particular. Any number of successive actions of ejectment could be brought by the plaintiff, although he had been defeated. The only check upon actions of this kind was a resort to a court of equity, for an injunction to prevent harassing litigation. In England the fictitious portion of the proceeding was abolished by the Common Law Procedure Act of 1852, and the action placed upon satisfactory grounds. In New York and some other States the same result had been accomplished as early as 1830.

Eviction.—Depriving a person of his lands or tenements. Technically, the dispossession must be by judgment of law; if otherwise it is an *ouster*. Eviction may be total or partial. Total eviction takes place when the possessor is entirely deprived of his rights in the premises. Partial eviction takes place when the possessor is deprived of only a portion of them, as if a third person comes in and ejects him from a portion of his land, or establishes a right to some easement over it, by an older title than that under which he holds. See DISPOSSESS.

Ekaterinburg, ě-kä''tē-rěn-boorg', or **Iekaterinburg**, Russia, town, in the government and 170 miles southeast of Perm, on the east

EL BRACITO—ELÆAGNUS

side, and in the mining district of the Ural Mountains. It was founded in 1723 by Peter the Great. It has a mint, arsenal, custom-house, mining-school, hospital, and botanic garden. The art of cutting, polishing, and engraving gems, which are found in the neighboring mountains, is here carried to great perfection, and, together with mining and metallurgy, and a commerce in cattle and cutlery, forms the chief occupation of the inhabitants. Pop. 56,129.

El Bracito (N. M.), **Battle of** (Doniphan's name BRAZITO, Mexican TEMASCALITOS), 24 Dec. 1846, in the Mexican war. Col. Doniphan, marching from California to Chihuahua, was assailed at a bend of the Rio Grande, some 25 miles from El Paso, by a battalion of Mexicans under Antonio Ponce. The Mexicans fired at long range as they charged; the Americans waited till they came close, then broke them with a destructive volley, and a company of 20 horse scattered their cavalry, which fled to the mountains. American loss, 7 wounded; Mexican, 43 killed and 150 wounded.

El Caney, ɛl kǎ'nǎ, Cuba, town, on the main road, four miles northeast of Santiago de Cuba. During the Spanish-American war it was the scene of a battle between 525 Spaniards under Gen. Vara del Ray, and 4,400 Americans under Gen. Lawton. The Spaniards lost 320, and 100 were taken prisoners; the Americans lost 440. This battle occurred 1 July 1898. In 1901 the United States government purchased the battlefield and approaches for a public reservation. See SPANISH-AMERICAN WAR.

El Dorado. See ELDORADO.

El Dorado, Kan., city, county-seat of Butler County; on the Walnut River; the Atchison, T. & S. F., and the Missouri P. R.R.'s; about 25 miles east of Wichita. The city is situated in a rich agricultural region, and its principal trade is in dairy and farm products. There are several manufacturing plants, and a limestone quarry. Pop. (1900) 3,466.

El-Khargeh. See KHARGEH, EL.

El Obeid. See OBEID, EL.

El Paso, ɛl pǎ'sō, Texas, city, port of entry, and county-seat of El Paso County; on the Rio G.; the Atchison, T. & S. F.; the Texas & P.; the Rock I.; El Paso & N. E., Southern Pacific, and other railways; on the Rio Grande River in the extreme western part of the State. It is opposite Ciudad Juarez, Mexico, the north terminus of the Mexican Central Railway. El Paso is about midway between the tide water of the Atlantic (Gulf of Mexico) and Pacific Oceans, about 3,800 feet above sea level, and is central to the rich tributary regions of western Texas, New Mexico, Arizona, and the northern section of old Mexico; it is 600 miles from any railroad centre that may compete with it; and enjoys an extensive trade in grain, minerals, cattle and coal.

Manufactures, Business, etc.—El Paso's unequalled railroad facilities, the proximity in New Mexico of inexhaustible supplies of fuel coal, and the demand for supplies and machinery from the mines, ranches, and growing towns of its neighborhood make it one of the most important manufacturing cities of the southwest. Its most important industry is smelting the valuable ores of the neighboring

region. The El Paso smelters have a capacity of about 40,000 tons of ore a month. The monthly payment to miners for ores brought in averages nearly \$2,000,000, a large part of which finds its way into the stores and factories of the city; the monthly pay-roll of the smelters and other manufactories and the railways centering in the city is nearly \$300,000; and these together give to the financial interests a stability that is little affected by conditions in other parts of the country. Many eastern manufacturers, especially of machinery, have large warehouses here. El Paso has four national banks, with resources amounting to \$5,000,000 in 1904, and deposits of \$2,500,000, as contrasted with \$1,500,000 and \$750,000 respectively in 1890.

Buildings, etc.—El Paso is pre-eminently a city of homes. The streets are lighted by gas and electricity, and a well-planned electric street-railway system places all parts of the city within easy reach of the business section. The more notable buildings are the Federal building, county court-house, city hall, post-office, and high school. The city has five public schools, two parochial (R. C.) schools, a business college, and is the seat of the St. Joseph's Academy and of the Rio Grande Congregational Training School and Theological Seminary. There are several handsome churches, and two well-equipped hospitals. El Paso is a noted health resort, having many excellent hotels, some of which are open during the entire year.

Government, etc.—The city is governed by a mayor and a city council elected for a term of two years. The Spanish explorers visited the site at an early time. The first settlement was made in 1827, and the town incorporated in 1869. The present charter dates from 1889 with revisions of 1891. El Paso has grown more rapidly than any other city in Texas or the southwest. The city has had no boom, its increase being healthy and substantial, and in accordance with the demands of commerce and the development of the natural resources of the country tributary to the city. Pop. (1880) 746; (1890) 10,338; (1900) 15,906; (1904 est.) 30,000.

JUAN S. HART.

Editor El Paso Times.

El Reno, Okla., city and county-seat of Canadian County; on the Chicago, R. I. and P., Choctaw, O. and G., and St. Louis, El Reno, and Western Railways, near the geographical centre of the State. El Reno is the centre for a rich agricultural district, and has flour mills, iron foundries, machine shops, ice manufactory, grain elevators and other industries; six public school buildings, public library, high school, churches of several denominations, and three banks with a combined capital of \$275,000. It has gas and electric lighting, water works, and the most complete sewerage system in Oklahoma. It was first settled in 1890; made a borough the same year; and a city of the first class in 1892. It is governed by a mayor elected biennially and eight councilmen, four of which are elected each year. Pop. (1900) 3,383.

E. D. HUMPHREY,

El Reno Mill & Elevator Co.

Elæagnus, ɛl-ɛ-ag'nūs, a genus of shrubs or small trees of the natural order *Elæagnaceæ*. The species, of which there are about 15, are natives of the northern temperate zone, and are characterized by deciduous, entire leaves covered

with silvery or brownish scales, solitary or clustered apetalous axillary flowers, and one-seeded drupaceous fruits. They are valued in ornamental gardening for their foliage, usually decorative fruits and mostly fragrant flowers. The deciduous members are hardy in the north; the evergreen ones, which mostly come from Japan and China, only in the south. They are easily propagated by means of seeds, cuttings, and layers, and succeed upon almost any well-drained soil in a sunny situation. The best known species probably are: (1) *E. angustifolia*, the oleaster, or white olive, which attains a height of about 20 feet. It has been introduced from southeastern Europe or adjacent Asia, and has proved hardy in the bleak and cold prairie States. It is one of the most ornamental species. (2) *E. argentea*, the silver-berry, a native of the colder parts of Canada and the northern border of the United States. It seldom attains a height exceeding 15 feet and is perhaps the most popular native species. (3) *E. longipes*, the goumi, a species introduced from eastern Asia. It is gaining in favor. It attains a height of about six feet and, like the preceding, bears edible, slightly acid fruit of pleasant flavor. This last species became of horticultural importance during the last 25 years of the 19th century because it produces good crops of fruit in climates too rigorous for most of the other fruit-bearing shrubs and trees.

Elæis, ě-lē'is, or **Elais**, the name given to a genus of palms, tribe *Cococa*, and the spiny section of that tribe. It is diœcious or monœcious; the flowers, especially the males, in dense masses, packed very closely together; the fruit is partly three-sided, but somewhat irregular. *E. guineensis*, the maba or oil-palm of the West African coast, has heads of large fruits. The outer or fleshy part of the fruit is boiled in water, when the oil rises to the surface and may be skimmed off. In its native country it is used for butter. It constitutes one of the chief commercial products of western Africa. *E. melanococca* also furnishes oil. Both species yield by manufacture palm-wine.

Elæocarpacææ, ě-lē-ō-kār-pā'ce-ē, a sub-order of *Tiliacææ*, mostly East Indian trees. The fruits of some are eaten. The deeply wrinkled seeds or stones of the fruit of *Elæocarpus ganitrus* are made into beads for necklaces and bracelets in India. They are often called olive nuts.

Elæocarpus, ě-lē-ō-kār'pūs, a genus of plants of the linden family (*Tiliacææ*), to which belongs the American basswood. The species of the genus are shrubs and trees, and are found chiefly in New Zealand, Australia, and southeastern Asia. The plants are of commercial importance wherever they grow. From the seed-stones of *E. ganitrus* the natives of Australia make necklaces. The New Zealanders find a rich black dye in *E. lunan*, and in India several species furnish one of the ingredients of curry-powder.

Elæococca, ě-lē-ō-kōk'a, a genus of the spurge family (*Euphorbiacææ*). The pressed seeds of *E. verrucosa*, a Japanese plant, furnish oil for burning, as do those of the Chinese *E. vernicia* oil for mixing with paint. Both these plants are cultivated and are now known under the common name of *Alcurites cordata*.

Elæodendron, ě-lē-ō-dēn'drōn, a genus of the staff-tree family (*Celastracææ*). The plants of the genus are generally trees, natives of Ceylon, southern Asia, and western and southern Africa. The drupes of *E. kuru* are eaten at the Cape of Good Hope, while the bark of *E. roxburghii*, rubbed with water, is used by the Hindus as an external application to swellings of all kinds. *E. glaucum*, a native of Ceylon, is sometimes called the Ceylon tea-tree. Saffronwood is the product of *E. croccum*, and an oil in common use in Africa is made from *E. argan*.

Elagabalus, ē-lā-gāb'a-lūs, or **Heliogabalus**, hē'li-ō-gāb'a-lūs, Roman emperor: b. Emesa 204 A.D.; d. 222. His real name was Varius Avitus Bassianus, but having, when a mere child, been appointed high-priest of the Syro-Phœnician sun-god Elagabol, he assumed the name of that deity. Soon after the death of his cousin, Caracalla, Elagabalus was proclaimed emperor by the soldiers, in opposition to the legitimate sovereign, Macrinus. The rivals met in battle at Antioch 218 A.D., Macrinus was defeated, and Elagabalus assumed the purple. His reign of three years and nine months was infamous for the debaucheries of every kind in which he indulged. He instituted ceremonies in honor of the god Elagabol, and it is believed made human sacrifices to him. He was murdered in an insurrection of the Prætorians and was succeeded by his son, Alexander Severus.

Elaine, ě-lā'in, or **Elain**, a name for the oily principle of fat obtained by submitting fat to the action of boiling alcohol, allowing the stearin to crystallize, and then evaporating the alcoholic solution; or by the simple process of pressing any oily or fatty substance between folds of bibulous paper, the oily matter or Elaine is absorbed, while the stearin remains. The paper being then soaked in water and pressed, yields up the Elaine. It possesses much the appearance and properties of vegetable oil, is liquid at the temperature of 60° F., and has an odor derived from the solid fats from which it has been extracted.

Elam, the ancient name of a country or region in Asia, east of the Lower Tigris. The cuneiform inscriptions record that a king of Elam conquered Babylonia and Assyria about 2300 B.C. The later ancient writers call this country Susiana, the name being derived from its capital, Susa or Shushan, one of the most ancient cities of the East. It is now known as Khoozistan. Both the country itself, which seems to have been of considerable importance at an early period, and its capital, Shushan, are mentioned in the Bible.

Consult: Sayce, 'Inscriptions of Mal Amir'; Loftus, 'Travels and Researches in Chaldaea and Susiana'; Billerbach, 'Susa'; Dieulafoy, 'L'Acropole de Suse.'

Eland, ē'land, the largest antelope (*Oreos canna*) found in Africa. It is as big as a fully grown horse, weighs 1,000 pounds or more, and stands fully six feet high. The early settlers in South Africa called it "elk." The eland has a short, smooth coat of rich fawn color; strong, straight horns about 20 inches long; and a broad fringed dewlap falling about to the knees. The hide makes excellent harness

ELANET—ELASTICITY

leather; and the flesh is decidedly palatable. The elands move so slowly, and are such gentle creatures, as to be easily caught, and hence have been nearly exterminated in their native haunts. At present very few are found. In the equatorial region of western Africa is found the still larger species (*Oreas derbianus*).

Elanet, ěl'a-nět, *Elanus*, a genus of *Falconidae*, allied to the kites, which they resemble in many of their characters; but from which they differ in having the short tarsi half covered with feathers, and the claws, except that of the middle toe, rounded beneath. The tail is very little forked. One species (*E. melanopterus*) is common in Africa from Egypt to the Cape of Good Hope, and is found also in India. Another species is the black-shouldered hawk (*E. dispar*) of America, the northern limit of which appears to be South Carolina. Both of these feed chiefly on insects, which they catch on the wing, but they also prey on small birds and reptiles.

Elapidae, ěl-ăp'i-dē, or *Elapinae*, a group of highly venomous snakes, having a short, rounded head covered with plates. They are more nearly related to the harmless colubines than to the vipers, but have a poison apparatus of the proteroglyph type, which are smaller than in the viperine snakes, but very deadly. The group is a large one and found in most parts of the world, but is most numerous in the tropics. Nearly all the snakes of Australia are elapine, the whole race of cobras (q.v.), the coral and harlequin snakes and others. The genus *Elaps* is entirely American, and is represented by a single species in the United States (Florida).

Elaps, ěl-laps. See CORAL-SNAKE.

Elasmobranchii, ěl-ăs-mō-brăng'kī-i, a subclass of fishes, containing the sharks and rays. The skull is cartilaginous with only superficial calcifications and no true dermal bones; the gills fixed and shaped like pouches; the upper jaw is the pterygo-palatine bar, and the lower jaw Meckel's cartilage, attached to the skull by a large hyo-mandibular element; the exoskeleton consists of tooth-like granular tubercles or spines; and the trunk endoskeleton is cartilaginous. The ventral fins are far back and bear claspers in the males; the heart has but one auricle and one ventricle; and the intestine is provided with a spiral valve. The group is nearly coextensive with Cuvier's *Chondropterygia* or cartilaginous fishes and the Placoidi of Agassiz, and has received various other names such as *Selachii* and *Plagiostomi*. Cope distinguishes as orders the *Selachii*, which includes all living as well as many extinct forms; and the *Ichthyotomi*, which are exclusively carboniferous and have simple claspers and extensive cranial calcifications. See DOGFISH, RAY, SAWFISH, SHARK, SKATE, etc.

Elasmosaurians, ěl-ăs-mō-să'ri-anz, gigantic marine fossil reptiles of the order *Sauropterygia*, found in cretaceous beds. As a living animal it was contemporaneous with *Plesiosaurus*, of the same order, which abounded in the eastern hemisphere, and as a fossil has been found in Europe and New Zealand. *Elasmosaurus* had a lizard-like, elongated body, sometimes 45 feet long, flattened limbs which served as oars, and a long, paddle-shaped tail which assisted its motion through the water. The head

was proportionately small, and with the neck performed twisting motions much like the corresponding parts of the swan. The contents discovered in the body indicate that this seasaurian lived on other rapacious fish, which it was able to seize with its crocodile-teeth. The fossil has been raised from cretaceous beds in New Jersey and in Kansas.

Elasmotherium, ěl-ăs-mō-thē'rī-ŭm, an extinct rhinoceros which inhabited Siberia and Russia during the Pleistocene Epoch. It exceeded the Indian rhinoceros in size, and bore an enormous horn on the frontal bone of the skull. The teeth are very long-crowned, with the enamel ridges strongly crenulated. Some of the native Siberian legends are supposed to refer to this animal; it was a contemporary of early man in that region.

Elastic Limit. See ELASTICITY.

Elastic Tissue, fibrous tissue in most cases mixed with the fibres of areolar tissue. It occurs in the ligaments of the vertebræ, that of the jaw, etc., also in connection with arteries, veins, and lymphatics. It is used in the animal structure whenever an extensible and highly elastic material is required.

Elasticity, that property of bodies in virtue of which they tend to return to their original shape or bulk, after having been subjected to distortion, compression, or extension. The fundamental principles of the theory of elasticity are well understood; but in applying these principles to the precise solution of the practical

FIG. 1.

FIG. 2.

problems that arise in physics and engineering, mathematical difficulties are encountered which often appear to be insuperable. In fact, there are comparatively few problems in elasticity whose solutions are known with precision, except in those cases in which the deformation of the body under consideration is exceedingly small. In the study of such problems we have to deal (1) with the deformation that the elastic body experiences, and (2) with the forces that are associated with that deformation. In the convenient phraseology of Rankine (which has been generally adopted by later writers), the deformation itself is called a "strain," and the internal forces that the continued existence of this strain implies are collectively known as the "stress." Rankine's own language on this point is as follows, save for a single minor modification: "The word 'strain' will be used to denote the change of volume and figure constituting the deviation of a definite elementary portion of a solid from that condition which it preserves when free from the action of external forces; and the word 'stress' will be used to denote the force, or combination of forces, which this same elementary portion exerts in tending to recover its free condition, and which, for a state of equi-

librium, is equal and opposite to the combination of external forces applied to it." These definitions being established, the theory of elasticity may be defined as that branch of pure mechanics which deals with the stresses and strains to which elastic bodies are subject. In an æolotropic or anisotropic body, such as a crystal belonging to the orthorhombic, monoclinic, or triclinic system (see CRYSTAL), the elastic properties are different in different directions, and it is found that the equations that are required in order completely to specify the connection between the stresses and strains that may exist in such a body involve no less than 21 constants.

FIG. 3.

FIG. 4.

It is easy to understand that this fact implies enormous mathematical difficulties in the solution of problems relating to such bodies; and these intrinsic difficulties are still further enhanced by the fact that there is probably not one substance in nature, for which the actual numerical values of these constants are all known. (For a thorough but necessarily difficult discussion of the elastic theory of crystalline bodies, consult Rankine's 'Axes of Elasticity and Crystalline Forms,' in his 'Miscellaneous Scientific Papers.') When, on the other hand, the body has exactly the same properties in all directions (or is "isotropic"), it is found that only two constants are required; but even in this comparatively simple case the mathematical difficulties of the general theory are so great that it is usually impossible to solve problems in which the deformations to be considered are of any considerable magnitude.

In the remaining portion of this article it will be assumed that the body under consideration is strictly isotropic—that is, that it has the same

FIG. 5.

elastic properties in all directions, and in all its parts. Fortunately this restriction is not incompatible with the great majority of problems that arise in practical work. In such a body, as has been said above, there are but two independent elastic constants, which have to be determined by experiment for the particular substance under consideration. These are known, respectively, as the "bulk modulus" (or "volume modulus"), and the "modulus of simple rigidity," though numerous other names are also applied to them. If V is the original volume of an isotropic solid, and $V - v$ is its volume when

subjected to a uniform normal pressure of P pounds per square inch over its entire surface, then $\frac{v}{V}$ is called the "compression," and the "bulk modulus" of the body (which is commonly represented by the letter k) is defined as

$$k = P : \left(-\frac{v}{V} \right) = P \left(\frac{V}{v} \right)$$

The values of this modulus for some few common substances are given below.

The modulus of simple rigidity is usually defined by reference to the distortion that a small cubical portion of the unstrained solid undergoes when the distorting force is applied. Fig. 1 represents a cube of this sort, which is supposed to be so small that the force acting upon any one of its faces may be considered to be uniform over the entire face. When such a cube is in equilibrium the most general kind of stress to which it can be subjected is resolvable into stresses of two types: (1) a uniform compressive stress, acting with equal intensity on all its faces, and therefore tending merely to alter its volume without producing any distortion of form; and (2) four equal forces, acting upon four of the faces, and disposed in pairs as shown in Fig. 1, one pair being directed inward and the other pair outward. The system of forces shown in Fig. 1 tends to alter the shape of the cube by extending it in one direction, and flattening it in a direction at right angles thereto; but there is no tendency in such a system to alter the bulk of the cube, since the extension produced by one of the pairs of forces is exactly neutralized by the compression produced by the other pair. If the dotted line in Fig. 1 were a line of weakness across the cube, it is evident that the effect of the force-system in that figure would be to cause the upper part of the cube to slip, relatively to the lower part, as suggested in Fig. 2. In fact, if the forces acting upon the upper part are compounded together, and those acting upon the lower part are also compounded in the same manner, it is plain that the four forces of Fig. 1 may be considered to be equivalent to the two that are shown in Fig. 3; so that the tendency of the stress-system shown in Fig. 1 is merely to cause one part of the cube to slide, relatively to the other part, along a plane that is parallel to the direction in which the resultant forces act. A stress such as is here described is called a "shear." To estimate the resistance of a body to deformation by the action of a shearing stress, consider a small cube to be cut from the original one, as suggested by the dotted lines in Fig. 4; and for the sake of fixing the ideas, let strips be conceived to be cemented to this cube at the top and bottom, as indicated in Fig. 5, so that the equal and opposite distorting forces can be conveniently applied. Then the effect of the forces in Fig. 5 will be to distort the cube into the shape indicated by the oblique dotted lines, and the magnitude of the angle i may be taken as the measure of the rigidity of the material of which the cube is composed; this angle being smaller (for a given shearing stress), the greater the rigidity of the substance considered. Stresses such as those shown in Fig. 5 are said to be "tangential"; and the "modulus of rigidity" of a substance may be obtained experimentally by applying such a pair of tangential

ELASTICITY

forces to a unit cube of the substance, and then dividing either of these equal and opposite tangential forces by the observed value of the angle ϵ , as expressed in radians. The modulus of rigidity is commonly denoted by the letter n .

The bulk modulus and the modulus of rigidity of an isotropic substance being known, problems concerning the elastic behavior of that substance can be solved by known mathematical methods, when the strains to be considered are quite small. For these methods, advanced treatises on theoretical mechanics must be consulted. One of the best books, so far as the presentation of the general principles of the subject is concerned, is that of H. Poincaré, 'Leçons sur la théorie de l'élasticité.'

Different bodies possess different degrees of elasticity, both of bulk and of form, and the elasticity of the same body will usually vary sensibly with the temperature. A body in which a certain definite strain is always accompanied by identically the same condition of stress, at a given temperature, without regard to the variations of temperature, bulk, and form to which it may have been subjected in the intervals between successive repetitions of the experiment, is said to be "perfectly elastic." Fluids (that is, gases and liquids) possess perfect elasticity of bulk, since a given fluid always requires the application of the same pressure, in order that its bulk may be diminished by a given constant amount, at a fixed temperature. Many solids also appear to possess perfect elasticity, both of bulk and of form, so long as the strains to which they are subjected do not exceed certain limiting values. Thus when a bar of steel is extended by the application of a longitudinal tension, it will return to its original length when the tension is removed, provided the extension that was produced (when expressed as a fraction of the total length of the bar) did not exceed a certain limit. If the extension exceeded this limit, the bar will shorten upon the removal of the tensile force, but will not return precisely to its original length. The permanent elongation so produced is technically known as the "permanent set" of the material. The tensile force that will just extend a bar of unit sectional area to the point at which it first receives a permanent set, is often called, commercially, the "elastic limit" of the material; though the expression "yield point," which is less generally employed, appears to be preferable. When a tensile force is applied to such a bar as we have been considering, and in such a manner that the force, at first zero, increases gradually up to a maximum value, the bar stretches under its influence, and it is observed that for a considerable time the extension of the bar is almost precisely proportional, at any given instant, to the force that is being exerted at that instant. As the bar approaches its yield point, however, the extension is found to exceed the value that it would have if the law of proportionality held good up to the yield point. The tensile force to which a bar of unit sectional area is subjected when the departure of the extension from strict proportionality to the force is first observed is also often called the "elastic limit" of the material; though, since it does not coincide with the yield point, it is more accurately described as the "limit of proportionality." The general phenomena here discussed are observed also in connection with strains other than

mere extensions. Thus when solid bodies are deformed in any way by the application of an external force, a permanent set is observed if the deforming force is large enough; and the deformation, which at the outset is proportional to the applied force, ceases to be so when that force attains to a certain limiting value. In some cases, however, fracture of the material may supervene before any permanent residual set can be actually realized, and the deformation of the material may also remain sensibly proportional to the applied force, even up to the point of fracture. The general law that the distortion of an elastic body is strictly proportional to the applied force, provided that force does not exceed a certain limit, is known as "Hooke's law," from the fact that it was first explicitly stated by Robert Hooke, for the simple case of the extension of a bar by tension (*Ut tensio sic vis*).

When a straight bar of metal (or other solid substance) is subjected to an endwise pull, it elongates in the direction of the tension, and contracts in all directions at right angles thereto. If L is the original length of the unstrained bar, and $L + l$ is its length when sub-

jected to the longitudinal tension P , the ratio $\frac{l}{L}$

is called the "longitudinal extension" of the bar, under the influence of the tension P . From Hooke's law it follows that the longitudinal extension, as so defined, is proportional (for small strains) to the force P , so that the quotient obtained by dividing the force P by the longitudinal extension that it produces is constant. When the sectional area of the bar is unity (or, what amounts to the same thing, when P is the tension per unit of sectional area of the bar),

$$E = \frac{PL}{l}$$
 this constant, which has the value $\frac{PL}{l}$, and is

usually denoted by the letter E , is called "Young's modulus," from the fact that its importance was first recognized by Dr. Thomas Young. Since the elastic properties of an isotropic body are determinate when the "bulk modulus," k , and "modulus of rigidity," n , are known, it follows the Young's modulus, E , is not independent of these two. In fact it can be shown that the simple relation

$$E = \frac{9nk}{3k + n}$$

must hold true among these three quantities.

It has been said above that when a bar is exposed to simple longitudinal tension its diameter diminishes simultaneously with the increase of its length. Let the absolute diminution of the diameter be divided by the diameter itself, and the absolute increase in the length be divided, similarly, by the length itself; and let these two quotients be designated, respectively, as the "lateral contraction," and the "longitudinal dilation." The ratio of the lateral contraction to the longitudinal dilation is an important physical quantity, which is called "Poisson's ratio," after the French mathematician Poisson, who studied it extensively. Mallock found it to be 0.253 for steel, 0.325 for brass, 0.348 for copper, 0.375 for lead, 0.50 for india rubber and paraffin, and zero for cork. Poisson and Navier concluded from erroneous mathematical reasoning that the ratio in question is precisely 0.250 for all iso-

ELASTIN — ELATERIUM

tropic bodies, and in this they were followed by Cauchy and many other distinguished authorities. It may be shown, however, that Poisson's ratio is expressible in terms of the bulk modulus and the modulus of rigidity by means of the formula

$$\text{Poisson's Ratio} = \frac{3k - 2n}{2(3k + n)}$$

This expression cannot be numerically equal to 0.250, unless the modulus of rigidity is precisely three fifths of the bulk modulus — a relation that could not be assumed to hold true generally, and which we know, from experiment, to be false for multitudes of bodies that are sensibly isotropic. The wide range of values observed by Mallock therefore corresponds, in all probability, to a similar variation in the actual value of the constant, and cannot be safely attributed to errors of experiment.

The various moduli to which reference has been made have been determined experimentally for many substances. They differ appreciably in different specimens of the same substance, being influenced both by the chemical composition and by the physical state of the specimen tested. In the following short table values are given that will apply with a fair degree of accuracy to the average specimens of steel, brass, and glass that are likely to be met with in practical problems:

Modulus	Substance		
	Steel	Brass	Glass
Young's.....	30,000,000	14,000,000	7,200,000
Rigidity.....	12,000,000	5,200,000	2,900,000
Bulk.....	26,000,000	14,000,000	5,800,000

In this table the unit of length is the inch, the unit of force is the attraction that the earth exerts upon one pound of matter, and stress is supposed to be expressed in pounds per square inch. The several moduli here given do not strictly satisfy the formula given above for expressing Young's modulus in terms of the bulk modulus and the modulus of rigidity; but that is because they are averages of numerous results, taken from a variety of sources, and it appears to be better to give the experimental averages just as they were obtained, rather than to manipulate them so as to bring them into precise conformity with the formula. The formula itself is sufficiently trustworthy to serve for the calculation of any one of the three moduli of a given substance, when the other two moduli of that substance are known. Consult for further numerical data Rankine, ('Useful Rules and Tables'); and Everett, ('Units and Physical Constants'). In the latter book the data are given in the C. G. S. system.

Elastin, an insoluble proteid substance, of which the elastic fibres of connective tissue are composed. It may be conveniently prepared from the *ligamentum nuchæ*, by boiling with ether and alcohol (to remove the fats), and afterward by prolonged boiling, successively, with water, strong acetic acid, and concentrated caustic soda, and subsequent successive treatment with weak acetic acid, water, hydrochloric acid, and water. When so prepared, elastin is not soluble (without decomposition) in any known solvent. It dissolves with decomposition

in concentrated sulphuric acid, however, yielding leucin, but not tyrrsin. Elastin is digested both by pepsin and by trypsin, and it contains no sulphur. Its percentage composition, according to Muller, is: C=55.45; H=7.41; N=16.19; O=20.89.

Elate'a. See CITHÆRON.

Elater, ĕl'ā-tēr, a genus of beetles in the pentamerous sub-order, type of the family *Elateridæ*. They are familiarly known as "click-beetles" or "skip-jacks," from their habit of jerking themselves with a slight noise into the air when they land or are placed on their backs. The body is arched upward and suddenly straightened with a violent muscular exertion, which lifts the animal from the ground. The legs are too short for the ordinary method of righting the body. The larvæ are only too familiar as "wireworms" (q.v.). Some tropical forms are phosphorescent. See FIREFLY.

Elateridæ, ĕl-a-tēr'i-dē, a family of *Coleoptera* (click-beetles), tribe *Pentamera*, sub-tribe *Sternoxia*. It contains the insects placed by Linnæus in his great genus *Elater*, now broken up into many genera. See CLICK-BEETLE; FIRE-FLY.

Elat'erin, a neutral chemical substance having the formula $C_{20}H_{28}O_6$, and obtained by alcoholic extraction of the greenish precipitate thrown down by the juice of the slightly unripe squirting cucumber, *Ecballium elaterium*. It crystallizes in hexagonal tablets which melt at 400° F., and are insoluble in water, but soluble in chloroform and in hot alcohol. Elaterin has a bitter taste, and is a powerful purgative, the dose being from the 40th to the 10th of a grain. A crimson color, changing to a scarlet, is produced when sulphuric acid is added to a solution of elaterin in carbolie acid; this reaction serving as a test for its presence.

Elat'erite, an elastic, asphalt-like mineral, known as "elastic bitumen." In color it is dark brown, with a specific gravity ranging from 0.9 to 1.2. It occurs abundantly in Derbyshire, England, and a mineral closely allied to it has been found at Woodbury, Conn.

Elaterium, ĕl-a-tēr'i-um, a mixture of principles formed as a precipitate, occurring spontaneously in the juice of the fruit of the wild or squirting cucumber, *Ecballium elaterium*, the active principle of which is elaterin. The squirting cucumber is a small perennial, of the cucumber family, indigenous in Persia, India and the warmer Oriental countries, and has been extensively cultivated even as far north as England. The fruit itself is 1½ to 3 inches long by 1-3 to 3-4 of an inch, oblong or oval in shape, covered with soft bristles, and yellowish green in color. It is firm externally. As the fruit ripens fermentation takes place in the interior with the formation of gas. This accumulates in sufficient quantities to exert considerable pressure, bursting the fruit at its base and squirting the seeds some distance. In this manner the fruit is distributed. Flaterium has been used for centuries as a cathartic, the phenomena of the squirting seeds having suggested its function. Elaterin itself is an neutral principle of the formula $C_{20}H_{28}O_6$. It forms in minute white prismatic crystals, without odor and with a slightly gritty and bitter taste. Elaterin is one of the most active of all the hydragogue cathar-

ELBA — ELBING

tics. It operates with violence even in minute doses. It is particularly of service in conditions in which there is general dropsy and no inflammatory condition of the intestinal tract. Elaterin is given in doses of from 1-40 to 1-10 of a grain.

Elba (Lat. *Ilva*; Gr. *Ætalia*), a small island belonging to the kingdom of Italy, in the Mediterranean Sea, off the coast of Tuscany, and with several much smaller isles, lying at the mouth of the Gulf of Piombino. The island of Elba is 18 miles from east to west, with a width varying from $2\frac{1}{2}$ to 12 miles in its widest part. The mountainous districts of the island yield large quantities of superior iron, marble, lodestones, and alum, besides wines and fruits. On the first abdication of Napoleon in 1814, Elba was assigned to him as a residence and empire. Here he accordingly took up his residence, in the month of May; and on 26 Feb. 1815, he secretly left the island, and, landing in France, began that brief and final career, known in history as the "Hundred Days." Elba was a place of celebrity in the time of the Romans, and famed then, as now, for its yield of iron. Two good ports are Porto-Ferraio and Porto-Longone, both well fortified. Pop. 25,480.

Elbe, *ělbě* (ancient *ALBIS*; Bohemian, *LABE*), a river of Germany, one of the largest in Europe. It rises on the southwest slopes of the Schneekoppe or Snowcap, one of the Riesengebirge, between Bohemia and Silesia. From this point it flows nearly due south into Bohemia for about 50 miles, when it turns to the west, and after about 40 miles takes a general north-northwest direction till it empties into the North Sea, intersecting Saxony, a considerable portion of Prussia, and in the latter part of its course separating Holstein on its right from Hanover on the left. The length, including windings, is upward of 780 miles. The principal affluents are on the right, the Iser, Schwarz-Elster, and Havel; on the left, the Alder, Moldau, Eger, Mulda, and Saale. In the lower part of its course the river is divided by five large and seven small islands into several arms, which unite again about five miles below Hamburg. The mean depth is 10 feet, average breadth 900 feet. It is more or less navigable for about 470 miles, but its estuary at Cuxhaven is much encumbered with sandbanks. It is well stocked with fish. On 1 July 1870, the navigation of the Elbe was declared free from Hamburg to Melnik in Bohemia. There is an important system of canal navigation in connection with the Elbe. Hamburg, for instance, being in this way connected with Berlin.

Elberfeld, *ěl'bër-fěld*, Germany, town in the Prussian Rhine province; 15 miles east of Düsseldorf, in the beautiful valley, and on both sides of the Wupper, enclosed by lofty hills. It has no historical or antiquarian importance. Its prosperity has been acquired mostly within the present century, and is due to the cotton manufacture, of which it is the central locality in Rhenish Prussia. In addition to the cotton manufacture, which, under a variety of forms, is the great staple of the town, linen, woolen, silk and mixed silk goods, ribbons, and velvet are extensively made, and largely exported. There are also numerous mills for spinning cotton twist, linen yarn, and worsted, and dye-works,

celebrated for the richness of their colors. The environs are almost covered with bleachfields. Pop. (1900) 157,927.

Elberfeld System, a system of poor-relief which originated in the appointment of six visitors in 1800, to investigate applications for aid, in the manufacturing town of Elberfeld, Prussia. The city was subsequently divided into districts, the number of visitors was increased, and the operations developed, until by 1852 what has become known universally as the Elberfeld System was adopted. Its main features are the division of the city into 26 districts subdivided into 364 precincts, each precinct being administered by an almoner who investigates each application, in cases of emergency provides immediate assistance, and as long as aid is afforded, visits the applicant twice a month. Money relief is granted fortnightly according to a fixed schedule, any earnings in the meantime being deducted; when needed, working implements are provided. A meeting of the almoners under the presidency of an overseer takes place every fortnight to discuss cases and to vote necessary relief, a report of the meeting being laid the next day before the directors who are chosen from four councilmen and four citizens with the mayor as chairman *ex officio*. The directors superintend and advise on the whole city's work. The positions of almoners, overseers, and directors are of a purely honorary character. The advantages of the system in the improvement of the condition of the poor have been strongly apparent, the ratio of persons assisted in 1889 being 7 per 1,000 as against 17 per 1,000 in 1855. See also CHARITIES.

Elberon, N. J., sea-coast summer resort in Monmouth County, on the Pennsylvania and the Central Railroad of New Jersey. Pop. (1901) 200. Here President James A. Garfield (q.v.) was taken after he was shot by Guiteau, 6 Sept. 1881, and died here 19 Sept.

El'berton, Ga., city, county-seat of Elberton County; on the Southern and the Seaboard A. L. R.R.'s; 90 miles northeast of Atlanta. It is in a cotton-growing section and the chief industries are connected with the cultivating, shipping, and manufacturing of cotton. It contains manufactories for cottonseed-oil, cotton goods, compressing cotton, and for fertilizers for the cotton plant. The quarries nearby give employment to a number. Pop. 3,902.

Elbeuf, *ěl'běf*, France, town, in the department of Seine-Inférieure, 11 miles south-southwest of Rouen, situated in a beautiful valley on the left bank of the Seine. It has handsome churches, public buildings, and homes. It has spinning-mills, dye-works, and all accessories for the complete production of woollen manufactures, chiefly of lighter cloths, checkered stuffs, fine colored flannel fabrics, and all kinds of fancy goods. Pop. 40,500.

El'bing, Germany, seaport town, in West Prussia, on the Elbing, near its entrance into the Frische-Haff, 32 miles east-southeast of Dantzic. It is divided into the old and new towns, the former of which was once surrounded by turreted walls and gates, but these for the most part have been removed. It has ship-building yards, which do a considerable trade in building and repairing vessels. Its manufactures include cloth, leather, soap, tobacco, and beer.

By means of a canal it has connection with the Vistula, and the harbor was improved by the opening in 1884 of a mole 3,500 yards long. Pop. 50,121.

Elbow. See ARM.

Elbow Joint. See ARM.

Elbruz, ĕl'brooz, or **Elburz**, (1) A mountain range of Persia, running for 450 miles along the southern border of the Caspian Sea. It has a number of subordinate parallel ridges, enclosing extensive and fertile valleys; and unlike most Persian ranges, it has numerous prominent spurs, the highest peak being Mount Demavend (q.v.). (2) Elbruz is also the name of the loftiest summit of the Caucasus.

Elcano, Juan Sebastian de, hoo-än' sä-bäs-tē-än' dā ä'l-kä'nō, Spanish navigator: b. Guetaria, Guipuzcoa. He was captain of the Concepcion, accompanying Magellan, and was the first to circumnavigate the world, completing his journey of three years 8 Sept. 1522. He went with Garcia Jofre di Loaysa on the westward voyage to the Moluccas, and died after passing the straits of Magellan and gaining the Pacific.

Elcesaites, ĕl-sē'sa-its, or **Elkesaites**, a sect founded in the 2nd century, during the reign of Trajan. They derived their belief from the teachings of the Book of Elkesai, supposed to have been inspired by an angel. Their system seems to have been a commingling of Oriental philosophy with Sudaism and early Christianity. Probably put into practice with the idea of satisfying the want of those persons seriously troubled by the religious chaos of the day caused by the mighty conflict of greater creeds. The followers of Elkesai or Elxai are often confounded with Ebionites (q.v.). The best account we have of the Elcesaites is given by Hippolytus in his chief work, 'Philosophumena.'

Elchingen, ĕl'hīng-ĕn, Bavaria, village, on the Danube, nine miles northeast of Ulm, which gave the title of Duke of Elchingen to Marshal Ney, who here defeated the Austrians 14 Oct. 1805. In the neighborhood are the ruins of a Benedictine Abbey of the same name, founded in 1128. There are two villages, Ober and Unter Elchingen, the former on the same hill with the abbey, the latter to the northeast of it. The hill on which the abbey stood was occupied by Mack, who had his headquarters in Ulm; while Ney, on the right bank of the river, repaired the bridge of Elchingen, forced the passage of the river, and took Elchingen by storm.

Elder, John, English engineer: b. Glasgow 1824; d. 1869. Educated in Glasgow, he was first employed as director of the drawing office of Napier's establishment, becoming later a member of the great ship-building firm which was known after 1860 as Randolph, Elder & Company, employing more than 4,000 men. His fame rests upon his invention of the compound or combined high and low pressure engines, saving nearly 40 per cent of fuel.

Elder, Susan Blanchard, American writer: b. Fort Jessup, La., 19 April 1835. She was married to C. D. Elder of New Orleans. She began to write for the press, under the name

"HERMINE," when quite young. She has published: 'The Loss of the Papacy'; 'James the Second'; 'Savonarola.' Her contributions to Roman Catholic publications are numerous. Her dramas are written for representation in Roman Catholic colleges.

Elder, William Henry, American Roman Catholic prelate: b. Baltimore, Md., 22 March 1819; d. 31 Oct. 1904. When 12 years old he entered Mount Saint Mary's College, Maryland, and at 18 was graduated and sent to Rome, where he was ordained priest 29 March 1846. Returning to America, he accepted the professorship of theology at Mount Saint Mary's, became its president, and remained here until consecrated bishop of Natchez, 3 May 1857. On one occasion, when the Federal authorities, who had taken possession of the city, bade Bishop Elder offer certain public prayers and command his clergy to do likewise, he stoutly refused, declaring that in thus ordering him they were usurping the right of religious liberty, and rather than comply he accepted imprisonment; when the case was reported at Washington he was promptly released. In 1878 Natchez was visited by an epidemic of yellow fever and the bishop fell a victim to the plague, which carried him to the point of death. In 1880 he left Natchez to assume the duties of coadjutor to Archbishop Purcell, of Cincinnati, Ohio, who at once retired, leaving Bishop Elder to settle the perplexing difficulties that disturbed the diocese. Upon the death of Archbishop Purcell, in 1883, Bishop Elder succeeded to the archbishopric of Cincinnati. The archdiocese now (1905) has a Catholic population of about 200,000; 312 priests; 184 churches; 105 parochial schools; 4 orphanages and 7 hospitals, besides seminaries, colleges, academies, and charitable institutions.

Elder, Sambucus, a genus of shrubs or small trees and a few perennial herbs of the natural order *Caprifoliaceæ*. There are about 20 widely distributed species characterized by opposite, pinnate leaves, small white flowers usually in compound cymes, and black, red, white or green, juicy fruits (berries or drupes). Many of the species are used in ornamental planting, since they are readily propagated by root and stem cuttings, succeed well upon nearly all soils, are of rapid growth, graceful form, and are attractive both in flower and fruit. The best-known species in America is *S. canadensis*, the common or sweet elder, which is frequently seen in fence-rows, along roadsides, and on the margins of woods throughout southern Canada and the greater part of the United States. It attains a height of 10 feet or more, bears abundant fragrant flowers in midsummer and black berries in early autumn. These fruits are used where they can be obtained plentifully for making pies and elderberry wine. Several horticultural varieties have been introduced for their golden or variegated foliage, and one variety with large fruits was introduced in 1890. The flowers are used for making a wine, a perfume, and a "water" used in confectionery. Economically this species ranks as a minor fruit. Like some other members of its genus, it has also been used in medicine, but is rapidly giving place to other drugs. Probably *S. nigra*, the common European elder, ranks next in importance. It is much larger, often attaining a

ELDERS — ELDORADO

height of more than 20 feet. The yellow, hard, tough wood is readily polished and is used for making skewers, fishing-rods, needles for making fish-nets, and as a substitute for boxwood. It is also employed for the same horticultural and economic purposes as the preceding species, and has numerous fancy-leaved varieties. Other well-known species are the scarlet elder (*S. racemosa*), an Old-World species, and the red-berried elder (*S. pubens*), a native of North America, considered by some botanists to be identical. There are also several unrelated plants which are popularly known as elder, as box-elder (*Negundo aceroides*), wild elder (*Aralia hispida*), also known as bristly sarsaparilla, and marsh-elder (*Iva frutescens*).
